CONTENTS.

CHAPTER I.

Outlines of Geological History—Beginnings of Continent-making—Early Life Forms of the Silurian and Devonian Ages—Continental Development—Carboniferous Period—Mesozoic Epoch and Expansion of the Continent—Eras of Enormous Reptiles—New Forms of Animate and Inanimate Life—Further Development of the Continent Culminating in Upheaval of the Rocky Mountains.

CHAPTER II.

Outlines of Geological History, Continued—Tertiary Epoch and Changed Conditions—Revolution of Life Systems—Prolific Ages of Mammals—Continental Changes—Quaternary Epoch—Age of Glaciers—Period of Floods—Final Continental Adjustment—Effects of Erosion—Quaternary Mammals—Pioneer Man on the Western Hemisphere.

CHAPTER III.

Pre-Historic Man—Strange Race of Mound-Builders—Extent of Their Empire—Colorado Its Southwestern Borderland—Character of Their Monuments and Relics—Theories Attempting to Account for This Vanished People.

CHAPTER IV.

The Cliff-Dwellers—Locality, Area and Condition of the Region They Occupied—Magnitude and Extent of Ruins—Variety and Character of Handiwork—Probable Great Antiquity—Theories of Origin and Fate.

CHAPTER V.

The Indian of Historic Times—Theories of Origin—Families and Tribes—Former Territorial Locations—Linguistic Divisions and Ethnical Differences—Two Distinct Types of People—Languages and Personal Nomenclature—Present Numbers—Character, Methods and Peculiarities.

CHAPTER VI.

Indian Tribes of the Western Region—Character and Habits of the Arapahoes—Indian Domestic Arrangements—Various Other Tribes of the West—Utes and Their Chieftains—Pueblo Indians of the Southwest.

CHAPTER VII.

Overestimates of Indian Population—Medical Sorceries and Consequences—Indian Self-Esteem—General Character, Practices and Customs—Signs, Signals and Gesture Communication—Religious Beliefs and Rites—Superstitions, Traditions and Legends.

CHAPTER VIII.

Spanish Dominion in the Southwest—Guzman's Attempted Exploration of New Mexico—Remarkable Adventures of Cabeza De Vaca—De Niza's Advance to the Pueblo Country—Expedition of Coronado—His Long and Fruitless Search for the Mythical City of "Quivira"—Obscurity and Confusion in Spanish Accounts of the Expedition and of Quivira.

CHAPTER IX.

Antiquity of Spanish Settlements in the Southwest—Moscoso's Expedition Toward the Rocky Mountains—Later Visits of Spanish Explorers to the Colorado Country—Their Tireless Searches for Gold and Silver—Ill-Fated Expedition of Borilla and Humano—Founding of Santa Fe—Subsequent Northward Explorations—Spanish Settlements on and Near the Arkansas—Escalante's Colorado Explorations—Last Spanish Military Expedition Northeast from New Mexico.

CHAPTER X.

Pioneer French Incursions Toward the Denver Region—Uncertainty of Boundaries—Early Movements Northwest from New Orleans—Vague Geographical Beliefs of the French—Westward Expeditions by Way of the Missouri River—Spanish Movement Against Them—First Known Visit of White Men to the Site of Denver—Subsequent French Operations—Jurisdictions in Authority Over the Denver Region.

CHAPTER XI.

The Province of Louisiana—De Soto's Expedition West of the Mississippi—La Salle's Re-Discovery of Mouth of the Mississippi, on Which French Claims Were Based—French Settlements in Lower Louisiana—Extensions of French Occupation—Cession to Spain—Outlines of Political History of the Mississippi Valley Region—Purchase of Louisiana by the United States, and Causes Leading Thereto—Acquisition of the Floridas.

CHAPTER XII.

Outlines of Negotiations for Louisiana—Opposition to the Purchase—Transfer of the Province—Subsequent Divisions of Louisiana Territory—Its Extent and Boundaries—The Oregon Country—Other Territorial Accessions in the West—Wonderful Development of the Vast Western Domain.

CHAPTER XIII.

Pioneer Americans in the Pike's Peak Country—Lieutenant Pike's Exploring Expedition—His Attempt to Ascend the "Grand Peak"—Trying Experiences in Crossing the Mountains—Capture of the Party by Spaniards—Detention at Santa Fe—Subsequent Release and Return to the East—Pike's Impressions of the Western Country—His Soldier's Death.

CHAPTER XIV.

Long's Exploring Expedition—Its Arrival at the Mountains—Passing the Site of Denver—At the "Grand Peak"—Return Homeward—Adverse Impressions Arising from Reports of the Expedition—Bonneville's Expedition—Fremont's Celebrated Expeditions—Disasters that Befell the Fourth—Subsequent Military and Other Expeditions Into the Rocky Mountains—Frontier Military Posts.

CHAPTER XV.

Development of the Fur Trade—Early Traders and Trading Posts—Establishments Near the Site of Denver—Santa Fe Trail—Extinction of the Fur Trade—"The Lost Trappers," a Remarkable Story of Western Adventure—Noted Frontiers-Men and Traders—Improvidence of the Trappers—Death of Espinoza.

CHAPTER XVI.

Hunters, Trappers, and Traders—"Kit" Carson—"Dick" Wooton—"Jim" Bridger—"Jim" Baker—"Bill" Williams—John S. Smith—August Claymore—James P. Beckwourth—Aversion to Civilized Conditions—Character and Habits—Methods of Traders—Equipment of Trappers—Remarkable Recuperative Powers.

CHAPTER XVII.

"Great American Desert"—Early Exaggerations and Misconceptions—Awful Tales of Travelers—Effect of Reports of Long's Expedition—Webster's Views—Public Opinion of Pacific Railroad Surveys—Persistence of the Delusions—Greeley's Impressions—Slow Death of the "Desert" Fiction—Lingering Misconceptions of the Western Country—Meteorological—Present Aspects of the "Desert" Region.

CHAPTER XVIII.

Wild Animals of the Plains and Mountains—Enormous Numbers of Buffalo—Their Wanton Slaughter and Practical Extinction—Antelope—"Wild" Horses—Wolves and Prairie "Dogs"—Bears—Mountain "Lion"—Elk, Deer, and Mountain "Sheep"—Insect Pests—Approaching Extermination of Many Types of Wild Creatures.

CHAPTER XIX.

Early Rumors and Discoveries of Gold—Old-Time Stories and Traditions—Circumstances Leading to Organization of the Russell Party in Winter of 1857-58—Its Progress Across the Plains and Arrival at Mouth of Cherry Creek—Organization and Coming of the Lawrence Party—First Ascent of Pike's Peak—Effect of These Western Movements.

CHAPTER XX.

Gold-Seekers and Immigrants of 1858—Dismemberment of the Russell Party—Subsequent Operations of Those Who Remained—Placer Camp—Movements of the Lawrence Party and Founding of "Montana City"—O'Donnell's Company and "El Paso"—Circumstances Leading to the Beginning of Denver—First Building—Autumn Immigrants of 1858—Pioneer Business Men—The Leavenworth Party—Advent of George A. Jackson—Other Settlements in the Pike's Peak Country.

CHAPTER XXI.

Organized Beginnings of Denver—Pioneer "St. Charles Town Association"—Operations of Its Promoters—Story of the "St. Charles" Record—First Appearance of "Arapahoe County" in Local Annals—Town Companies "Squatters" on Indian Land—Organization of the Auraria City Town Company—Its "Constitution"—List of Its Shareholders—Surveying the Town, and Details Incident Thereto—First Lot-Donations—Home-Made Currency—Genesis of the Town's Name.

CHAPTER XXII.

212

Denver City Town Company—General William Larimer—Prompt Organization—Invasion of the "St. Charles" Town Site—Proceedings of the Company—Lists of Shareholders—Provision for the "St. Charles" Men—Nichols' Fate—Lot Donations—Denver City and Governor Denver—Surveying the Town—Attempt to Incorporate Denver City Company—Incorporation of the "St. Charles" Company—Final Proceedings of the "St. Charles" Men—Collapse of the Enterprise—Adnah French—McGaa's Prominence and Death—"City of Highland"—Marcy's Theory—Decimation of Timber—Disappearance of "Montana City."

CHAPTER XXIII.

"First" House-Building—Some of the "Early Settlers"—Pioneer Street Names—First Cabin—Other Early Builders in "Auraria City"—Beginnings of "Denver City"—Its First Cabin, and Subsequent Pioneer Improvements—Mercantile Pioneers—First Christmas Celebration at Cherry Creek—First Masonic Meeting—First Clergyman—Pioneer Women—Rivalry Between the Two Towns—Condition at Close of 1858—Their Common Heritage.

CHAPTER XXIV.

Effect in the East of "Pike's Peak Stories" in Winter of 1858-59—Great Invasion in the Spring of 1859—Reflex of Panic of 1857—Character of Immigrants—Hardships of the Journey—Reckless Enthusiasm of the Host—Legends Adorning Wagons—Daily Routine and Incidents—Delusions of Embryo Miners—Mass of Immigrants Not of Unworthy Men—Peculiar Circumstances Attending Colorado's Settlement.

CHAPTER XXV.

Progress of Cherry Creek Towns—New Business Enterprises—First Hotel—"Count" Murat—First Ferry—First Birth in the Settlements—Career of the First-Born—Isolation in that First Winter—Further Improvements and Business Enterprises—Arrival of Saw Mills—Political Movement—Pioneer Newspapers—Transactions of the Town Companies—Homicide—First Stages to Denver—Progress Made by Midsummer of 1859.

CHAPTER XXVI.

Depressed Conditions in the Spring of 1859—Their Causes—Slow Progress of Prospectors and Meager Results from Mining—Memorable Panic Among Immigrants—Vast Host of Gold-Seekers—Prospecting the Platte River—Discoveries in the Boulder District, and Operations Elsewhere—Work of Experienced Miners—The Great Discoveries on Clear Creek in the Mountains.

CHAPTER XXVII.

Details of Discoveries by Gregory and Jackson—Gregory's History and that of His Discovery—George A. Jackson—Particulars of His Discovery—Rough Conditions of Pioneer Mining in the Mountains—Jackson's Subsequent Career and Death—No Memorial to Either Discoverer.

CHAPTER XXVIII.

Race to the New Diggings—Swarming Miners—Conditions in Mining Camps—Weary and Disappointed Prospectors—Cheap Provisions and Other Supplies—Mining Progress—Miners' Bill-of-Fare—W. Green Russell's Discovery—Attempted Revision of Gregory District Mining Rules—Election of District Officers—Experience of Two Discoverers—Gunnell Lode—Yields of Mountain Mines—First Mining Regulations—General Developments in Clear Creek Region—"Luck" in Mining.

CHAPTER XXIX.

Horace Greeley's First Visit—A. D. Richardson and Henry Villard—Mr. Greeley's Adventures—Impressions of Denver—Excitement Over Clear Creek Discoveries—Visitors Go to Gregory Diggings—Mishaps to Greeley and Richardson—Famous Report of Greeley, Richardson, and Villard—Greeley's Speech at Gregory, and Lecture in Denver—His Theories of Mining—Richardson's Comments on Conditions in Denver—Greeley's Departure—Influence of His Writings in His Tribune.

CHAPTER XXX.

New Towns in Denver Region—Extension of Gold Discoveries—Founding of Golden—Wall's Pioneer Agriculture—Golden Gate—Mountain City—Black Hawk—Central City—Georgetown—Newspapers—Missouri City—Colorado City—Canon City—Progress of Mining Operations—Arastras and Quartz Mills—Consolidated Ditch—Forest Fires—Miner Killed by Indians—Lingering Frontiersmen—Floating Prospectors—Mines and Mine Owners of 1859—Road Construction—South Park Developments—Attacks by Indians—Tragedy of Dead Men's Gulch—General Notes—Mining Terms.

CHAPTER XXXI.

Bad Quality of Pioneer Liquor and Its Consequences—Ruffians, Gamblers, and Thieves—Rocky Mountain News—Eastern Newspaper Comment—Denver's First Fourth of July Celebration—Births of White Children—Further Transactions of the Town Companies—Termination of Their Records—General William Larimer—Trouble with William McGaa—Last Echo from "St. Charles"—Other "First-Born" Children—Bridge Building—Mercantile Additions—Prices—John McBroom—First School—First Duel—Another Proposed—First Marriage—Social Gatherings—Pioneer Theatrical Performances—Improvements—Great Mercantile Acquisition—Commercial Profits—Close of 1859—"The Cold Christmas."

CHAPTER XXXII.

"Territory of Jefferson"—The Political Romance in the History of Self-Government—Election of "Delegate" to Congress, and Representative in the Kansas Territorial Legislature—Preliminary Steps to Organization of Proposed "State of Jefferson"—Address to the People—Delegate Elections—Conventions, and Failure of State Movement—Rise, Progress, Decadence and Collapse of the "Territory of Jefferson," of Which Denver Was the Capital.

CHAPTER XXXIII.

Consolidation of the Cherry Creek Towns by the "Jefferson Legislature"—Election of City Officers—Ratification of the Union by Citizens—Encroachments on Cherry Creek—S. W. Beall's Mission—S. S. Curtis' Reminiscences—Second Duel—Broadwell House—First Fire—Transactions of the Town Companies—Denver Conditions in 1860—Changed Route of Stage Line—First Daily Paper—"Colorado" Jewett—Scenes at Stage Station—Fourth of July, 1860.

CHAPTER XXXIV.

Zenith of Placer Mining—Thronged Denver—General Notes—Further Progress of Mining—Building Operations—Agriculture—Women and Children—Pioneer Bankers—Crowded Streets—Stage Coach Mails—Institution of United States Mails—New Theater—Apollo Hall—Second Daily Paper—Pony Express News—Third Daily Paper—New City Government—Outcasts, Saloons and Gambling Houses—Background of the Picture.

CHAPTER XXXV.

Reign of the Lawless—Outrages by Ruffians—Methods of the People's Courts—Homicides in 1859—War Against "Claim Jumpers"—The "Turkey War"—Series of Wanton Homicides in 1860—Remarkable Case of James A. Gordon—Attack on the Office of the Rocky Mountain News—Great Organization of Horse Thieves—Grim Fate of Its Denver Leaders—Other Tragedies—Death of Harrison and McClure—Effect of Executions by People's Courts—Not the Work of Mobs.

CHAPTER XXXVI.

Commerce of the Plains—Its Magnitude—Overland Stage Lines—First Line to Denver—Trouble in Establishing United States Mail to and From Cherry Creek—First Postmaster—Volume of Express Mail Matter—Post Office Established on "Denver City" Side—Traveling by Stage—Central Overland, California and Pike's Peak Express Company—Famous Pony Express—Financial Misfortunes—Old-Time Stage Coach Men—Holladay Overland Mail & Express Company—Other Overland Lines—Local Stage Lines.

CHAPTER XXXVII. 466

Depressing Influences—Effect of Impending War—Property Values—Pioneer Pugilists—Population of City and Territory in 1861—Telegraph Lines and Rates—Pest of Gamblers—Depressed Conditions—Denver's Appearance—Great Fire—City's Extent—Cherry Creek Flood—Henry C. Brown's Land Entry—Reynolds Gang of Outlaws—Denver's Dreary Aspects—Windstorm of Christmas, 1864—Railroad Anticipations.

CHAPTER XXXVIII.

Denver in the Civil War Period—Conditions in Winter of 1860-61—Divided Sentiment of the People—First Flag-Pole Raising—Confederate Flag in Denver—Trials of the Situation—Activity of Southern Element—Military Preparations—First Colorado Regiment—Governor Gilpin's Drafts—Difficulties Growing Out of Isolation—Sibley's Confederate Army of Invasion—Its Advance and Defeat—Colonel Chivington's Services—Subsequent History and Operations of Colorado Military Organizations—Their Gallant Services Through the War.

CHAPTER XXXIX.

Period of Depression in Mining—Changed Character of the Work—Hegira of Autumn of 1860—1861 an Unsatisfactory Period—Adverse Conditions Through Several Ensuing Years—Era of "Speculative Mining"—Frauds and Abuses Attending It—Menacing Legislation Threatened in Congress—Continuation of "Speculative Mining," Its Consequences and Collapse—Conditions in Central City and Other Camps—Effect of Speculative Mania on Colorado and Denver—Solution of the Refractory Ore Problem.

CHAPTER XL.

Indian Wars—Preparations of Tribes for Hostilities—Influence of the Civil War—Attempted Indian Confederation—Denver's Danger—Preparations for Defense—First Battle with Indians—Panic in Denver—Massacre of Hungate Family—Plains Region Aflame—Interrupted Transportation—Circumstances Leading to Battle of Sand Creek—Outlines and Consequences of that Frightful Affair—Colonel Chivington's Clouded Declining Years—His Subsequent Career and Death.

CHAPTER XLI.

Continued Indian Warfare—City Threatened with Famine—Martial Law in Denver—Depredations and Massacres Along the Platte—Long and Bloody Indian War—Forsyth's Heroic Defense at Beecher Island, Arapahoe County—Indian Cruelties—Western Views of the "Indian Question"—Expensive Warfare—Indian Grievances—Last Stand of the Arapahoes and Cheyennes—Indian Chieftains—Power of Indians Broken.

CHAPTER XLII. 426

Denver Conditions in 1865—First Grasshopper Invasion—High Prices—Denver Architecture—Limits of Built-Up Area—Anti-Gambling Crusade in Winter of 1865-66—Work of Montana Vigilantes in and Around Denver—Population in 1866—Extent of the City in 1867—Wild Tales of Slaughter—General Conditions at Close of 1867—Advanced Price of Labor—Development of Agriculture—Railway Prospects—Another "Indian Scare"—Territorial Capital Removed to Denver—"City Lot Question" Arises—Last Appearance of Hostile Indians Near Denver—Encouraging Conditions at Close of 1868.

CHAPTER XLIII.

Denver Vigilance Committee Work—City Infested by Desperadoes of the Railroad Building Era—First of Strictly Local Lynching—Denver Pacific Railway—Growing Importance of Cheyenne—Governor Gilpin's Memorable Address—City's Improved Appearance—Revival of Mining—Real Estate Values—Census of 1870—Completion of Denver Pacific and Kansas Pacific Railroads.

CHAPTER XLIV.

Early Changes in City Boundaries—Territorial Act of March, 1864—"Congressional Grant"—Condition of Real Estate Titles—Judge Hall's Land Entry—Entries of Adjacent Lands—Old Plattings and Street Names—Meaning of Old Street Names in Business District—Change of Names by City Council—Some Particulars of the "Lot Question"—Confusion of Controversy and Wrangling Growing Out of It—Exaggerated Losses—Popular Myth of "Lost Real Estate Records."

CHAPTER XLV.

Colorado's Pioneer Captains—Additional Personal History of the Russell Brothers—Favorable Influence of Railways—Effect on Real Estate and General Business—Arrival of Chinese—Construction of Gas Works—First Water Works System—New Colonies in Colorado; Greeley, Longmont, Colorado Springs, and Fort Collins—Denver's Substantial Development—Broader Municipal Policy—Geological Surveys—Prominent Visitors—Mr. Greeley's Last Coming — Famous "Diamond Swindle"—"Denver City" Becomes Denver—Its Population—Panic of 1873—Hayden's Surveys—Wrangles of Politicians—Threatened Removal of Territorial Capital to Pueblo.

CHAPTER XLVI.

Close of the Territorial Era—"Hard" Winters—City's Purchase of Capitol Hill Ditch—Grasshopper Visitation—Last Territorial Legislature—Celebrating Statehood—Advancement of City and State—"Murphy Movement"—Floods in Cherry Creek—Propositions to Divert Creek—Effect of Leadville "Boom"—Activity in Building—Free Mail Delivery—City's Extent—Outbreak of Ute Indians—Profound Excitement in Denver—Particulars of that Tragedy.

CHAPTER XLVII.

The "Chinese Riot"—Causes Leading Thereto—Action of Authorities—Riot Suppressed—Citizens' Meetings—Introduction of Electric Lights—Futile Pioneer Gas Companies—Incorporation of Electric Light Companies and Their Consolidation—Development of Electric Lighting—National Mining and Industrial Exposition—National Encampment Grand Army of the Republic—Development of Sixteenth Street—Rival Metropoles in the Earlier Times—Conceptions of Eastern Visitors—Beginning of Denver's Great Development.

CHAPTER XLVIII.

Great Speculative Era—Conditions Preceding It—Awakening in 1880—Census of 1880—Phenomenal Ratio of Population Increase—Slight Reaction 1884-85—Beginning of the Great "Boom"—Rapid Rise in Property Values—Period of Amazing Activity—Enormous Aggregates of Real Estate Transactions—Sky Rocket Land Prices—Vast Operations in Building—Speculative Fever a Mania—Square Miles of Town Lots—Collapse in 1893—Disastrous Consequences.

CHAPTER XLIX.

Territory of Colorado—Various Proceedings in Congress Prior to Final Passage of Organic Act—State and Territorial Home Conventions in 1860—Passage of the Colorado Bill in February, 1861—Names Proposed for the Territory—Appointment of Officers—Institution of Lawful Civil Government—Territorial Executive Officers and Delegates in Congress—Territorial Capitals and Administrations—Several Movements for Statehood and Their Failure—Negro Suffrage—Passage of Final Enabling Act—Constitution Framed and Adopted—Colorado Admitted to the Union—Organization of State Government—Some Causes of Statehood's Delay.

CHAPTER L.

Colorado Bill of Rights—Governors—Election Statistics—United States Senators—Congressional Districts and Representatives—Legislature—Judiciary—Executives—Salaries—Suffrage—Delay in Providing a Capitol—Henry C. Brown's Gift—Futile Efforts to Utilize It—Litigation Over the Donated Site—Denver Chosen the State Capital—Capitol Building Authorized—History of Its Construction—Total Cost—Noble Edifice—Character of Our Legislatures.

CHAPTER LI.

State Institutions — University — Agricultural College—School of Mines—Normal School—Soldiers' and Sailors' Home—Institute for Blind and Mute—Asylum for Insane—Home for Dependent and Neglected Children—Industrial School for Boys—Industrial School for Girls—State Reformatory—Penitentiary—Colorado's Vast Domain—Conspicuous Features, Climate and Resources—Aggregate Values of Products—Population—Finances—The Future.

CHAPTER LII.

Arapahoe County—Its History Prior to Founding of Denver—Origin in 1855—Election in 1856—County Establishments in Our Pioneer Times—Multiplicity of Elections and Officers—Organization Under Colorado Territory—Transition from Territory to State—Pioneer Court Houses—Investments in Railways—County Buildings—County Domain—Valuations and Tax Levies—Population—County Towns—Topography, and Character of Land.

CHAPTER LIII.

Mining and Smelting—Period of Their Great Development—Beginning of Silver Mining—Pioneer Smelters and Development of Smelter Processes—Denver Smelters—Various Reduction Processes—Colorado's Output of Precious Metals—United States "Mint" and Its Processes—Gold Values—Cripple Creek District—Its Output, Great Mine Discovery, Dividends, and Geological Character—Railroad and Smelter Charges—Mining Casualties—Large "Nuggets"—Mining Romances and Traditions—Element of "Luck" in Mining—Mining Exchanges—Mining Stocks and Dealings in Them—Colorado Gold District—Possibilities and Future of Colorado Mining—Mining as an Industry.

CHAPTER LIV.

Denver's Pioneer Railroads—Earlier Discussions of a Trans-Continental Road—First Proposed Railroad to Denver—Clear Creek Survey—Union Pacific and Kansas Pacific Roads Authorized—Denver's Disappointment—Golden's Priority in Railroad Projects—Colorado Central & Pacific—Uncertainties of the Railroad Situation in 1867—Various "Railroad Meetings"—Organization, Struggles, Progress and Triumph of the Denver Pacific Railroad Company—Operations of the Kansas Pacific—Completion to Denver of the Denver Pacific and Kansas Pacific—Other Railroad Plans—Governor Evans' Recompense to Arapahoe County—Effect of Railroad Connections—High Rates.

CHAPTER LV.

Colorado Central Railroad—Its Completion Between Denver and Golden—Projected Main Line—Construction in Clear Creek Cañon—Effect of Panic of 1873—Denver, Georgetown & Utah Railway—Union Pacific and Kansas Pacific Roads—Consolidation of Latter With Colorado Central—Extraordinary Proceedings in Connection With Disruption of Consolidation—Subsequent History of the Central—Denver & Boulder Valley Railroad—Denver & Rio Grande Railroad—History of Its Inception and Construction—Its Remarkable Development—Its War With the Santa Fe Road, Reorganization, and Subsequent History—South Park Road—Story of Its Origin, Progress and Misfortunes—Reorganization as Denver, Leadville & Gunnison Railway.

CHAPTER LVI.

Denver & New Orleans Railway and Its Successor—Denver, Texas & Fort Worth, and Fort Worth & Denver City Roads—Construction of Various Local Railways—Burlington, Santa Fe, Missouri Pacific, Colorado Midland, and Rock Island Roads—History of the Colorado & Southern and Its Constituent Former Companies—Colorado & Northwestern—Other Local Railroads—Union Pacific—Denver Union Passenger Station—Cripple Creek District Railroads—Prospective Trunk-line Extensions—Denver's Railway Facilities—Characteristics of Colorado Mountain Roads—Denver's Railway Builders.

CHAPTER LVII.

City Government—First City "Charter," and Pioneer Organization—Provisional City Government—City's First Legal Government and Its

Organization—Outline of the Government to 1885—Ward Divisions and Extension of City Boundaries—Election Times—Changes in Form of City Government—Appointive Controlling Boards—Objections to Them, and Movements for Return to "Home Rule"—Political Aspects—Names of Denver's Mayors—Fire Department—Police Department—City Parks—City Hall and Other Public Improvements—Vital Statistics—Denver's Suburban Towns.

CHAPTER LVIII.

Pioneer Newspaper Annals—Rocky Mountain News—Rocky Mountain Herald—Mountaineer—First Typographical Union—Pioneer Conditions—Denver Gazette—Newspapers and Newspaper Enterprises of the Middle Period—Special and Miscellaneous Publications—Denver Tribune—Later History of the Rocky Mountain News—History of the Denver Times, of the Denver Republican, and of the Denver Post—Character of Denver Daily Newspapers—Present Special and Miscellaneous Publications—"Newspaper Graveyard."

CHAPTER LIX.

Our Bench and Bar—Denver's First Lawyer—Unpromising Situation for Lawyers—Government in the Mining Districts—Conditions in Cherry Creek Towns—Plurality of Governments—"Jefferson" Judicial System—Territorial Courts—Denver Bar in 1861—Complexities of Colorado Litigation—Qualifications of the Successful Denver Lawyer—Strength of the Denver Bar—State Judicial System—United States Courts—Roster of Judges—Bar Associations—Our Courts the Guardians of the Rights of Men.

CHAPTER LX.

Pioneer Churches—Religious Influences in Frontier Communities—First Religious Meeting at Denver—Church Work in 1859—Sunday in Mining Camps—Town Companies Friendly to Churches—Pioneer Clergymen—First Church Organization—First Sunday School—Town Companies' Lot Donations to Church Organizations—Attitude of "Bad Men"—Organization of Episcopal Church—History of the Several Pioneer Denominational Organizations—Present Number of Church Organizations in Denver—Young Men's Christian Association.

CHAPTER LXI. 772

Denver's Pioneer Schools—O. J. Goldrick, the First Pedagogue—Other Early Schools—Miss Maria Ring—Town Companies' Donations for Schools—Beginnings of Public School System—First Organization of School Districts—First Public School—Slow Development of Schools—County School Organization—Period of Indifference—First Building Owned by a District—Separate School for Colored Children—First Building Owned by District No. 1—School Establishment in 1870—Legislation of That Year.

CHAPTER LXII.

Independent Incorporation of District No. 1—School Districts—Disadvantages of Division—History of District No. 1—Statistics—District Officers—"East Denver" High School—Manual Training School—History of District No. 2—Its School Officers—Extent and Character of Its Schools—History of District No. 17—Its Schools and School Officers—Origin and Development of Districts No. 21 and No. 7—Breadth and Character of the Denver School System.

CHAPTER LXIII.

University of Denver—Its Origin, Rise, and Present Magnitude—Denominational Schools—St. Mary's Academy—Loretto Academy—College of the Sacred Heart—Wolfe Hall—Jarvis Hall—Baptist College—"Westminster University"—Private Schools—Old-Time Libraries and Reading Rooms—High School Library—Mercantile Library—Present Public Library—State Historical and Natural History Society—State Museum of War Relics—State Collection of Minerals.

CHAPTER LXIV.

Our Charitable and Benevolent Institutions—First Hospital—Early Public Charities—Present Hospitals—"Oakes Home"—Jewish Hospital for Consumptives—Provisions for Helpless Children—Other Helpful Institutions—Secret and Other Fraternal Orders and Societies—First Masonic Organization—Peak Lodge, I. O. O. F.—Outline of Local History of Grand Army of the Republic—History of the Society of Colorado Pioneers.

CHAPTER LXV.

Pioneer Women—Ladies' Union Aid Society Their First Organization in Denver—Pioneer Ladies' Aid Society—Development of "Club Movement" in Denver—More Prominent Organizations of Women in Denver—Outlines of Their Work—Colorado Federation of Women's Clubs—Club Influence—First Movement for Woman Suffrage and Its Failure—Second Failure—Established by Popular Vote in 1893—Women as Public Officers—General Results of Woman Suffrage.

CHAPTER LXVI. 993

Denver's Water Supply—Pioneer "Franchises" for "Waterworks"—Ditches of the Primitive Era—First Waterworks System—Denver City Water Company—Its Trying Experiences and Unfortunate Career—Organization of the Rival Citizens' Water Company—Fierce and Disastrous Competition—Bankruptcy of Old System and Consolidation of the Two as the Denver Union Water Company—Huge Reservoir in the Mountains—Outlines of One of the World's Great Undertakings in Reservoir Construction.

CHAPTER LXVII.

Banks and Banking—Pioneer Financial Institutions—Clark, Gruber & Company's Mint and its Coinage—Parson's Coins—Scrip Issues—History of Various Banking Organizations—Erlanger's "Bank"—Walter A. Stuart—National and Savings Banks—Effect of Panic of 1893—Existing National and Other Banks—Denver Clearing House—United States Mint—Denver as a Financial Center—Enormous Present Resources of Denver National Banks.

CHAPTER LXVIII.

Denver's First Telegraph Line—History of Its Construction—Early Difficulties in Operation—Other Local Telegraphs—Coming of the Telephone

—Extraordinary Development of the System—Street Railways—Pioneer Denver Horse Railway Company—Denver Electric and Cable Railway Company and Its Successors—Denver City Cable Railway Company—History of the Development of the Cable and Electric Systems—Acquisition of all Lines by Denver City Tramway Company—Present Extent of the System—Influence in Upbuilding the City.

CHAPTER LXIX.

Commercial and Manufacturing Interests—Pioneer Mercantile Establishments—Volume of Their Business—Beginning of Manufacturing in Denver—Extent and Character of the Business—Influence of Railroad Communications—Development of Commercial and Manufacturing Business at Present Time—Early Organizations of Business Men—History of the Chamber of Commerce and Board of Trade—Denver's Future as a Commercial and Manufacturing Metropolis.

CHAPTER LXX.

A Chapter of Miscellany—Old City Cemetery—Masonic and Odd Fellows' Cemetery—Riverside Cemetery—Fairmount Cemetery—Mt. Olivet Cemetery—Fort Logan and Its Origin—Military Department of the Colorado—Places of Amusement—Character of Pioneer Theaters—"Jack Langrishe"—Home Theatrical Talent—Guard Hall—Tabor Opera House—Broadway Theater—Lyceum and Denver Theaters—Summer Amusement Places—Theaters that are Not—Prominent Denver Clubs.

CHAPTER LXXI.

High-Tide Year—Conditions Just Prior to 1893—Great Financial Crisis—Season of Disaster—Exodus from the City—Experience with Commonwealers—Conditions in 1893-94—Withered Bank Assets—Government by Folly—Waite's Administration and Its Evils—Special Session of Legislature—Waite's "War on the City Hall"—Disgraceful Episode in City's History—Denver on Verge of Civil War—History of the Affair, and Its Final Settlement—Evils of Political Iniquities.

CHAPTER LXXII.

Period of Recovery—Institution of Festivals of Mountain and Plain—Gumry Hotel Horror—Mining Disaster Near Central City—Storm-bound Railroads—Proposed Auditorium—Failure of the Project—Proposed Municipal Waterworks—Bonds Authorized and Sold—Legal Interruption of Proceedings—Census of 1900—Disappointing Result—Analysis of Causes—Tides in the Affairs of Denver.

CHAPTER LXXIII.

War With Spain—Interest Excited in Denver—Call to Arms—First Colorado Infantry—Its Organization—Camp Alva Adams—Departure of Regiment for the Orient—Its Services in the Philippines—Regiment Ordered Home—Arrival at San Francisco—Reception at Denver—Regiment's Mortalities—Colorado Cavalry Organizations—Colorado Battery—Society of the Army of the Philippines—Naval Vessels "Denver" and "Colorado."

CHAPTER LXXIV.

Denver's Prominent Buildings—Dates and Circumstances of Their Erection—Pioneer Structures Previously Occupying Their Sites—Changes Within Forty Years—Cost of Conspicuous Present Edifices—Surviving Old-Time Buildings.

CHAPTER LXXV.

Denver's Bright Prospects—Old-Time Views of Its Destiny—Orton's Prediction—The City's Historical Perspective—Its Present Substantial Advancement—Noble Site for a Great City—Masses and Peaks of Colorado Mountains—Their View from Denver—Names and Altitudes of Conspicuous Elevations—City's Altitude—Inspiration to Municipal Ideals—Needed Municipal Improvements—Denver Architecture and Denver Homes—Climate and Invalids—Conclusion.

EDITORIAL NOTE.

This volume, the contents of which historically "round out" with the close of the Nineteenth Century, represents, in a broad sense, a desire entertained through several recent years by my friend, Hon. Earl B. Coe; and at whose instance its preparation was undertaken.

The geological and palaeontological history outlined in Chapters I and II is based upon Le Conte's "Elements of Geology," Lyall's "Principles of Geology," Winchell's "Sketches of Creation," Dana's "Manual of Geology," Hutchinson's "Extinct Monsters," Marsh's "Jurassic and Cretaceous Reptiles and Birds, and Jurassic and Tertiary Mammals" (American Journal of Science), Reports by Prof. Cope of the University of Pennsylvania, Reports of the University of Wyoming, Wright's "Ice Age in North America," Hayden's "United States Geographical and Geological Surveys," Powell's "Exploration of Colorado River," Reports of the Smithsonian Institution, and reports of United States and other geological surveys. What is said concerning ancient man and pre-historic races, chiefly in Chapters III and IV, mainly rests upon Lyall's "Antiquity of Man," Foster's "Pre-Historic Races," Baldwin's "Ancient America," Short's "North Americans of Antiquity," Blacket's "Lost Histories of America," Bancroft's "Native Races," Reports of the Bureau of Ethnology—Smithsonian Institution, Post's "Cliff Dwellers and Pueblos," Chapin's "Land of the Cliff Dwellers," and, with respect to articles of handicraft and existing works and ruins, in part upon my own observations. Authorities for the general contents of Chapters V, VI and VII dealing with the Indian people, are the Reports of the Bureau of Ethnology—Smithsonian Institution, Reports of the Interior Department of the United States government, Catlin's "Indians of North America," Schoolcraft's "Memoirs" and his "Indian Tribes," Eastman's "Sioux," Dorman's "Primitive Superstitions," and Brownell's "Indian Races of America." The accounts of early Spanish and French explorers and adventurers in our west-southwest country, appearing in Chapters VIII, IX and X, largely depend upon Winsor's "Narrative and Critical History of America" and his "Mississippi Basin," Lummis' "Spanish Pioneers," Bandelier's "Gilded Man" (El Dorado), Ladd's "Story of New Mexico," Greenhow's "History of Oregon and California," Sanland's "Missions of California," Prince's "Historical Sketches of New Mexico," Inman's "Old Santa Fe Trail," and Dumont's "Memoires Historiques sur La Louisiane." The historical outlines of Louisiana, Chapters XI and XII, are principally derived from United States Senate Documents (XIXth Congress), Waite's "American State Papers," Stoddard's "History of Louisiana," Gayarre's "History of Louisiana," Barbe-Marbois' "History of Louisiana, and of the Cession of that Colony by France to the United States of North America," Winsor's two works above mentioned, Herman's "Louisiana Purchase," and the Missouri Historical Society's Tracts.

For the history of the Rocky Mountain country from the purchase of Louisiana to the founding of Denver in 1858, the sources of information were, aside from some of the works already named and some traditions and reminiscences orally transmitted, Pike's "Account of an Exploring Expedition" (etc.), James' "Account of an Expedition [Long's] to the Rocky Mountains" (etc.), Farnham's "Travels in the Great Western Prairies," Reports of Fremont's Exploring Expeditions, Fremont's "Memoirs," Peters' "Life of Christopher Carson," United States Reports of Surveys for a Pacific Railroad, Parkman's "Discovery of the Great West," Marcy's "Army Life on the Border," Barber's "History of the Western States," Inman's "Old Santa Fe Trail," Bancroft's "History of the United States," Bancroft's (H. H.) "History of Colorado" and his "History of Wyoming," Hayden's "Great West," the Missouri Historical Society's Tracts, and various reports and documents issued by the War and the Interior Departments of the National government. Many facts relating to the Colorado and of the old Kansas Territory were brought to light by an investigation at Topeka of records and documents in the archives of Kansas, and through information received from the Kansas State Historical Society at Topeka, and the Nebraska State Historical Society at Lincoln. From these sources, also, and from the statutes and records of the Territory and the State of Colorado, and from the records of Arapahoe county, much of the history of our State and county contained in this volume was derived. But in the preparation of these accounts, and also of various others having to do with events, affairs, conditions and incidents in Denver's pioneer era, I found help in Greeley's "An Overland Journey," Richardson's "Beyond the Mississippi," Hollister's "Mines of Colorado," McClure's "Three Thousand Miles in the Rocky Mountains," Fossett's "Colorado," Hall's "History of Colorado," and Bancroft's (H. H.) "History of Colorado."

In dealing with the history of Denver's founding and with various events that soon followed, the original records, or "minute" books, of the St. Charles Town Company, the Auraria City Town Company, and the Denver City Town Company, all of which are now recovered, and possessed by our State Historical and Natural History Society, were indispensable in marshalling the facts. The files of the Rocky Mountain News covering the pioneer years, which are the priceless property of Mr. William N. Byers, though in the Historical Society's keeping, afforded much of great historical value and which, in their absence, would have been utterly beyond recovery. For the city's subsequent history, the ordinances and records of the municipal government, and legislation by the Territory and the State, afforded important information. In this connection, also, the later files of the News, the files of the former Denver Tribune, of the Denver Times, the Denver Republican, and of the Denver Post, were fruitful concerning many events, circumstances and details, accounts of which are woven into this Story. The Census Reports of the United States supplied a large part of the limited statistical data presented; and for some other important facts incorporated in various chapters, requisitions made upon the War, the Treasury, the Interior and the Post Office Departments, at Washington, received the prompt and satisfactory attention that characterizes the transactions of the several executive divisions of our National government.

My acknowledgment of attention and assistance received is due Hon. George A. Clark, Secretary of State, of Kansas; Mr. George W. Martin, Secretary of the Kansas State Historical Society, at Topeka; Mr. W. J. Seever, Secretary of the Missouri State Historical Society, at St. Louis; Mr. Jay A. Barrett, Librarian of the Nebraska State Historical Society, at Lincoln; and Professor Stewart Culin, Director of the Department of Archaeology and Palaeontology, University of Pennsylvania, at Philadelphia.

I early placed myself in communication with several of Denver's conspicuous pioneers residing elsewhere: Dr. Levi J. Russell, of Heidenheimer, Tex.; Col. T. C. Dickson, of Cheyenne; Mr. E. P. Stout, of Cincinnati; Col. S. S. Curtis, of Omaha; Mr. W. H. H. Larimer, of Kansas City; the late Mr. Charles G. Chever, of Salem, Mass.; Mr. John A. Churchill, of Council Bluffs; Hon. Beverly D. Williams, of Little Rock, Ark., and Milton E. Clark, of Leavenworth. From these I obtained essential information not elsewhere available, and assistance in straightening out sundry tangles in the skein of our early local history. The aid received from Dr. Russell and Col. Dickson with relation to the beginning of things at the mouth of Cherry creek in 1858, derived from records they had made and preserved, could not have been rendered by any other men now living. Among other non-residents to whom I am indebted are Mrs. Katharine Denver Williams, of Natchez, Miss.; Mrs. Martha Marshall, of Briartown, Ind. Ter.; Mrs. Nina Jackson Atkins, of Bonham, Tex.; Dr. R. J. Pierce, of George's Creek, Ark.; Mr. Elam French, of Brandon, Vt.; Mr. John Easter, of Goldfield, Colo.; Mr. George W. Weidler, of Portland, Ore.; Mr. William Denver McGaa, of Pennington county, S. D.; and Mr. George R. Brown, Indian Trader at Rosebud Agency, S. D.

I desire to make special acknowledgment of my great obligations for the advice, suggestions, assistance and co-operation of Mr. William N. Byers, General Roger W. Woodbury, and Judge Wilbur F. Stone; and for their interested revisional reading of the manuscript before it passed to the press—a service also rendered by Dr. William F. Slocum, President of Colorado College at Colorado Springs. My obligations also extend to several other gentlemen of Denver, including Mr. Charles R. Dudley, Librarian of the Denver Public Library; Judge Hiram P. Bennet, Mr. E. B. Morgan, Mr. Peter Winne, Major Jacob Downing, Mr. Joseph C. Shattuck, Secretary of the University of Denver; Mr. E. A. Willoughby, Secretary of the Society of Colorado Pioneers; Mr. Andrew Sagendorf, and Mr. Frank M. Cobb; and would, also, were he living, to the late Judson H. Dudley.

Beyond some accounts of lawlessness in the pioneer times and of the applied remedies therefor, this Story of Denver does not enter into what may be termed the criminal annals of the city. Part of the circumstances and conditions of pioneer life here were so vividly reflected in certain deeds of violence, and in other iniquities of lesser gravity, that to have omitted accounts of them would have deprived the reader who is of these times of information necessary to a full understanding of the difficulties and dangers our pioneers had to meet and overcome. But it did not appear essential to record in this volume the crimes and viciousness of the subsequent years. The criminal annals of every important city in our country constitute a dark and gruesome part of its history. Like the others, Denver has had her share of the deeds of wicked men. To have related, even in outline, the circumstances attending these would have required an additional long chapter; and it certainly would not have been one especially acceptable to the reader, nor would it have possessed historical value of commanding interest. It is true that it would have included accounts of several crimes that were followed by extraordinary consequences, among which were the "Dr. Graves case," as it is commonly called; the deed that led to the lynching of Arata; and, while it was only incidentally associated with Denver's history, the shocking tragedy of November, 1900, in which the negro, Preston Porter, was the criminal figure. However, to have entered upon consideration of such as these would have seemed to imply a reason, if not an obligation, to refer to others of lesser note; and so, it appeared to me, would have led to making criminal annals a general subject. Therefore, and because of the very nature of such a part of any large city's history, I decided to exclude that subject; and this conclusion was unanimously approved by several Denver gentlemen whose judgment I highly esteem.

The greater number of the illustrations pertaining to pioneer Denver are in this volume first published. The photographs and drawings from which they were made were obtained in part here at home: from our Historical Society; from Mr. W. G. Chamberlain, a pioneer photographer; and from many others interested in the preservation of such things. But not a few of them were sent me by non-residents whom I have above named. The views of Colorado City, Black Hawk, Central City, and several other Colorado towns as they appeared in the autumn of 1865, together with the series of views in Denver at that time, are from sketches by Albert E. Matthews, published in 1866. He was an invalid, and subsequently while camping on Big Thompson creek, north of Boulder, died and was buried there in a lonely grave.

The engravings are the work of the Williamson & Haffner Company, of Denver, and in results prove the careful attention they received; and in the production of the volume equal care and attention were bestowed by the Blakely Printing Company of Chicago.

Assembling the facts in the broad history of our city called for much research. Records were widely scattered; yet, of every event that ranks as of actual, or even relative, importance, authentic record in some form was finally found. I do not doubt that some of our surviving pioneers will encounter in this volume more than one statement in conflict with long-cherished impressions. The minute-books of the several town companies of 1858 with respect to the organised beginnings of the city, (the contents of which are now for the first time, I believe, revealed in full and in proper sequence,) and the hitherto buried records of Kansas Territory with respect to our county's early history, will disturb many such impressions. In dealing with some minor details of which no record could be found—nor reasonably supposed to have ever been made—the reminiscences of several surviving pioneers whose positions in the pioneer community were such as afforded them opportunity for familiarity with its affairs, and whose interest in the city's history has never lagged, were followed. Occasionally there was some diversity of recollection concerning minor details, and in such instances "the preponderance of testimony" was accepted as more probably representing the facts.

However, such unverified recollections are the basis of but an insignificant part of the contents of the volume. Some reminiscences that have fugitively appeared in print were of good service, and verification of them was readily found; but many, many, others have gone forth apparently unconscious of the existence of authentic old records and of their deadly hostility to graceful and pleasing products of imagination.

JEROME C. SMILEY.

Denver, 1901.

CHAPTER I.

OUTLINES OF GEOLOGICAL HISTORY—BEGINNINGS OF CONTINENT-MAKING—EARLY LIFE FORMS OF THE SILURIAN AND DEVONIAN AGES—CONTINENTAL DEVELOPMENT—CARBONIFEROUS PERIOD—MESOZOIC EPOCH AND EXPANSION OF THE CONTINENT—ERAS OF ENORMOUS REPTILES—NEW FORMS OF ANIMATE AND INANIMATE LIFE—FURTHER DEVELOPMENT OF THE CONTINENT CULMINATING IN UPHEAVAL OF THE ROCKY MOUNTAINS.

THE great ranges and towering eminences of Colorado's mountains, whose evening shadows fall across a city unrivalled in the world in the noble beauty of its situation, are youthful giants in the geological order of creations forming the continent they divide. Away to the east their elder brothers rose from the deep and grew old and gray and stooped long before these of the west were born of one of Nature's convulsions by which she separated the waters from the land. Records of the development of land and evolution of life-forms in this hemisphere, where both are thought to have had beginning, are preserved in the rocks, drifts, landmarks, objects, signs and tracings, almost as definitely and as significantly as the words and pictures appear on these printed pages. The strange story of Nature's processes, as they moved in long and mighty strides through uncountable years, is filled with proofs of her awe-inspiring methods. Her every impress is a revelation of progress through the ages which stretch away and blend into that distant time when the earth was without form and void. This Denver land of billowy plain and lofty mountain peak is one of her great cemeteries, abounding with evidence of the vast changes wrought in the aspects of the earth, and in the forms and character of living things and living creatures that have successively existed here. It was the scene of much of Nature's most wonderful handiwork.

It is hard for the human mind to even faintly comprehend the conditions existing throughout the first Epoch, of inconceivable duration, in the earth's geological history; that long, darkened, Archæan Epoch after the world took form, spanning vast cycles of time in the later of which the earth is believed to have been enveloped by an unbroken sea, out of which not a vestige of land appeared; and when the dreary loneliness of the endless waters was intensified by the fury and uproar of the restless elements contending with each other. Rains poured down in ceaseless torrents from the dismal canopy of clouds; the lightnings flashed and flamed, and the crashing thunders echoed through the murky caverns of a sunless sky. In that tempestuous era the world was wrapped in noxious mists, shrouded in an overwhelming gloom, and darkness was upon the face of the deep. The massive bed of Archæan rock which is believed by most geologists to have then been the outer film of the earth's submerged primitive crust, was buried far below the angry waves of its ocean blanket whose poisonous waters bore not a living thing—neither of vegetation nor of animate creature. The more ancient masses of Archæan matter, which in later eras were raised above the surface of that enveloping sea, and in many places remain exposed, have not revealed the faintest trace of life in any form.

Millions of years swept by and then came an upward movement from the depths. The cooling, contracting planet wrinkled its engulfed and thickening crust, and across the upper part of what is now North America, the waters parted and land appeared above the dreary, far-reaching waste. This upheaval, this ridge of Archæan masses, came out of bondage to the desolate sweep of waters, on the eastern side of the continent. Because of its appearance there where now lies the valley of the St. Lawrence river, it has received the name "Laurentian Hills." This ancient range, generally believed to have been the first-born land of the earth's present surface, stretches across Canada in the direction of Lake Huron, then bends away to the northwest toward the shores of the Arctic ocean. Through inestimable centuries it was a lonely land of desolation, its bleak and barren areas of igneous rock looking down in solitude over the waste of waters covering everything else the world contained.

These upheavals of the sea-buried Archæan rock were not accomplished in quiet nor by the ways of peace. Nature's tremendous forces were in violent action throughout a long lapse of years. The folds of the emerging crust burst as they were thrust upward, giving vent to the imprisoned fiery fluids they had hitherto kept in subjection. From these great fissures were vomited rivers and torrents of boiling, blazing liquid matter which fell and flowed into the steaming sea, while the flooding tempests raged and drove above. The elements were in seeming furious warfare one with another amid the most appalling uproar; but there was harmony of purpose in it all.

By such ways and means as these, in the flood and with the fire, it is believed, were the beginnings of the continent made in that far-off time. Our side of the earth has been labeled the "new world," but geology teaches that the other side came out of the deep long after the Laurentian Hills were first uncovered by the retreating waters.

On and on through unknown ages the slow movement from beneath is supposed to have widened the area of that emerging region, crowding the waters back, and preparing a place on which humble forms of animate and inanimate life on land could come into being in later periods.

In the Laurentian later superimposed limestones deposited as the closing periods of this stormy Epoch blended into the one which followed, have been found what are thought to be fossil remains of a minute animate creature of disc-like form. It is held by many geologists to have been the beginning of life on our planet, a single species brought forth by the sea, and of microscopic fossil structure.

The Laurentian masses are supposed to rest on the primitive solid envelope embracing the entire globe. They are quartzites, granites, schists and gneisses, and are accompanied in some places by the greatest beds of iron ore known in any of the earth's strata. Here in this region of the west, Colorado, Utah, Wyoming and the Dakotas, similar masses were later raised above the surface, bringing with them great quantities of iron; those in southern Utah being considered the largest deposits of iron ore in the world. The prevailing reddishness of much of the younger rock of Colorado, and of her soil, is due to the widely distributed oxide of this Laurentian iron—to the discoloration caused by ancient iron rust.

Through all subsequent ages that venerable range of Laurentian Hills has remained almost stable, and but little changed except by the erosive action of the elements. If it were not the primitive land, it is certainly the first of which there is any definite geological record. To this implied doubt some attention must now be given.

We have stated in the foregoing that the little creature, or supposed little creature, whose fossils are in the Laurentian limestones, is held by many geologists to have been the beginning of animate life. While this is true, the opinions of some other writers, who hold to contrary views, render some qualifications necessary. We quote from Fiske's "Outlines of Cosmic Philosophy:"

> "Since there have been several enormously long alternating periods of elevation and of subsidence, it follows that all the older sedimentary strata must have been metamorphosed by volcanic heat. These oldest rocks have sunk to a depth of six or eight miles, down below the ocean floor, where they have been metamorphosed by the heat of the molten liquid below, and whence they have again been slowly shoved up above water level, with all traces of their organic contents obliterated. This process may have occurred so many times as to have destroyed all but the later records of life."

Fiske is also of the belief that the common term "Palæozoic" is a misnomer as applied to the Silurian eras that have long been so designated, and attributes the beginning of life to a period hopelessly inconceivable in its remoteness. The absence of organic remains in the rocks of older epochs has been and still is generally considered fair proof that life did not exist when they were formed; but this theory is questioned by the foregoing quotation. Of the probability of earlier living forms, Fiske says:

> "Within a few years Cambrian and Laurentian strata have been discovered carrying us back into an antiquity nearly twice as great as that to which we had reached with the Silurian rocks. It is now generally admitted that even the Laurentia strata are modern compared with the beginnings of life on our globe."

"Are all these Laurentians to be considered as stratified rocks, metamorphosed by internal heat long before they were upheaved?" "Being stratified they were, therefore, sedimentary rocks, and as it seems evident that the whole Archæan area was sea bottom at one time, where, then, was the ancient land from which were derived the sediments to form these rocks?" ask those who deny pre-Laurentian land and life. Beside iron, large deposits of graphite are found in company with Laurentian rocks, and the two in connection with the question of pre-Laurentian life, may possibly have significance. Concerning this Le Conte points out:

> "Iron is accumulated now, and therefore probably also in earlier times, only by means of decaying organic matter, and is, therefore, justly regarded as a sign of life and a measure of its quantity. Graphite is regarded as the highest anthracite condition of coal; and coal is a positive sign of organic matter, and therefore of the previous existence of life. Limestone, as we have seen, is now, and at previous geological times, usually, though not always, of organic origin."

Professor Winchell, in his "Sketches of Creation," more than thirty years ago surmised that low forms of life existed unknown ages before the Laurentian times which have been generally regarded as having been in the dawn of the earth's geological history.

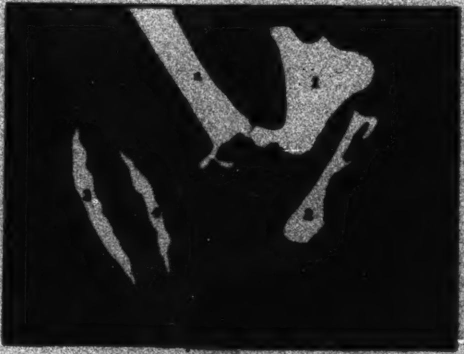
On the other hand many other distinguished geologists reject all these theories, and even reject the little Eozoon—dawn animal—of the Laurentian limestones as a thing of doubt, or one certainly unproved; and in maintaining their position assert that the Azoic—no life—masses of the Laurentian Hills constituted the first land of the earth, so far as geology has revealed; and that it is not worth while to try to go back of that, armed with nothing more substantial than surmises, and theories of possibilities

If the Archæan rocks are not absolutely the oldest —the primitive rocks next to the first solid envelope, as these last-mentioned geologists assert, no one knows what was before them, nor anything of the origin of the alleged sediments of which they may be formed. For some proof of what is, or was, the earth's primitive crust-film research has been made in vain. These Archæan rocks are of enormous thickness, and are believed to be equal to all the later rocks put together. The period of time they represent is probably as great as that of all the subsequent geological history of the earth; and as no one can say with any approach to certainty that life did or did not exist when they were formed, it may be well to turn, for consideration, to things that are better known.

Whatever may be the ultimate conclusion of the geologists concerning the beginning of animate creatures on the earth, it is known that the immeasurable Archæan Epoch was at last ended; and that the Palæozoic periods began under less murky skies and with the promise of sunshine to brighten the way through the coming years.

The great life-bringing Epoch, the so-called Primary, following the Archæan, has been divided for us by the geologists into four periods. The first of these, the Cambrian, was the primordial transition from the preceding, and is not of special interest here. The other three are the Silurian, Devonian, and Carboniferous—the Age of Invertebrates, the Age of Fishes and the Age of Coal Plants—and strange enough all of them were. In the first of these it is definitely and abundantly known that rude, primitive forms of the mystery we call Life, were developed. If, as it is said, history can not go back to its own absolute beginning, it may go to what is certainly known of it.

At this time—in the early ages of the Primary Epoch—the geography of this continent presented unpromising and watery aspects. The Laurentian Hills were in the east, and with them was a narrow strip of land along the Atlantic coast to the southward. Here in the west, a long, low, narrow, barren area of land extended from far down in Mexico northwestward to near Puget Sound, about on the line of the Sierra Nevadas; here where the Colorado mountains now stretch away, was another strip of like character, but of far smaller dimensions, extending northward into what is now Wyoming. It was merely a long, low, narrow island not far west of Denver's longitude. The accompanying maps of the ancient beginnings of the continent show these and subsequent configurations of the emerging land. How old these western areas were as compared with the Laurentian is unknown. But they must have soon followed the Laurentian, as they were here in the opening ages of the Primary Epoch.



North America in Primordial Times. (Black, present seas and lakes; shaded, parts of continent then covered by sea; white areas, then existing land. 1, Laurentian land; 2, Appalachian land; 3, Sierra land; 4, Region of Colorado ranges.)

The word "soon" used in this connection does not imply a brief interval of years. Geology can not measure time by so fleeting and infinitesmal an unit as a year. A million of years would probably be a more convenient counter. Furthermore, the geologists tell us of "lost intervals of time," and here preceding the definite records of the Palæozoic rocks occurs one of these intervals, the length of which can not even be guessed. There are many reasons for believing that during this era of blankness much wider areas of land existed, which were again submerged to the meager limits indicated by the map, which represents the present state of geological knowledge on this subject.

Between these strips of land in the east and in the west, the great Palæozoic Sea spread over the rest of the continent, submerging the broad valley of the Mississippi and all the rolling plains. The Rocky Mountains were not yet lifted from the deep when this wide sea united the waters of the Pacific and the Atlantic, and swept its surges over the site of Denver. The foundations of these great mountains and plains were beneath the billows, receiving the sediments of the same sea which rolled over the future lands of Babylon and Tyre.

Great changes in conditions came with the new, Silurian ages of this Epoch. Climates, as we have them now, seem not to have existed; a temperature, hot, and nearly uniform, encompassed the earth, and deluging rains drenched the meager land, eroding and leveling it, and washed the atmosphere of many of its impurities. But notwithstanding this there was a steady expansion from the small areas previously existing above the surface of the waters; and it may be stated here that this expansion continued through this Primary Epoch until, at the close of that grand division of geological history, the continent presented aspects similar, but not exactly, to those of the map representing the continent as it was in the Cretaceous period of the Mesozoic Epoch. The sun's rays had early begun to at times penetrate the cloud-masses, the elements were less violently disturbed, and a period of comparative peace ensued.

The primitive little creatures that had been endued with life in the early ages of this Epoch, became in the Upper Silurian division, of more definite individuality; but were still lowly forms. Simple sea-worms, sponges, sea-weeds, crinoids or "stone lilies," little embryo shell fish, and other diminutive bodies—myriads of them in all. The curious, pulpy animal forms of "star-fishes"—which were fishes only by courtesy, and because they lived in the sea—were also brought into being; and then came the first articulates, the trilobites, followed by other humble creatures of advanced complexity of structure. Of the singular plant-like forms, seeming to have been half vegetable, half animal, many were simple shapes, while others were elaborate and beautiful. The distribution of these early forms of life was wide-spread, and their numbers countless. The trilobites were the first to develop eyes, showing that the sun had then attained mastery of the clouds and mists, and that organs of sight had become necessary in the world. The large family of crustaceans multiplied and developed apace in the warm waters that had found comparative peace.

The fossil forms of all these creatures are present by millions in the sedimentary rocks everywhere.

The Silurian period drew to its close, and the multitudes of lowly beings brought into existence through its eras, began their exit from the stage of life. Many survived far into the succeeding Devonian age in which the fishes presented themselves, but the vast majority became extinct.

The Devonian was the prolific age of fishes, and they were a great stride from the preceding creatures from which they sprang; a far higher form, endowed with the back-bone, which all of us find so essential, physically and morally, in our own times. Following the fishes came the busy little reef-building coral animal to which the great limestone formations of the Devonian period are chiefly due. Though their numbers were beyond all computation, their unbuilding of the vast reefs and beds of this period must have required enormous lapses of time. The coral animal is one of the few survivors from that ancient era.

The Devonian fishes were the first vertebrates, and foreshadowed the coming of reptiles, birds and mammals. They were covered with large, stiff, thick scales—clad in a bony armor of them. These fishes were in great variety, and among them eventually appeared enormous sharks with huge jaws set with saw-teeth nearly as long and wide as the hand. Among these Devonian fishes was the gar-pike, whose descendants still exist. Finally a fish-creature appeared with fins enlarged to rudimentary wings or paddles—the herald of the reptiles; and new forms of crustaceans and mollusks abounded.

In all this lengthened time the area of land was gradually expanding; a large island had formed from Ohio to Tennessee in the closing Silurian ages, and the earth presented fairer aspects. In the Devonian age there was a marked development of plant-life. The former simple sea-weeds were now replaced by aquatic plants, and verdure brightened the landscape shores. Some of this vegetation still survives in the tropics. The Devonian period brought this development of fishes, of the coral animals and of many plants growing in the flooded lowlands. It must have been one of vast length, for the evolution of a vertebrated fish from an invertebrated lowly creature, required an enormous period of time. The production of the great, predatory family of huge sharks which then flourished was a process of long duration.

The flight of years by thousands and thousands through these middle ages in the strange history of the world, brought the end of the Devonian era, and prepared for the advent of still higher forms of animate and inanimate life. Greater areas of the earth appeared above the water. The long tongue of land stretching from northern Mexico to Puget Sound along the line of the Sierra Nevadas, and the short, narrow strip, lying north and south near the longitude of Denver, which had become exposed in early Silurian times, were slowly rising further out of the tide; and the sun's heat was still more effective on the surfaces. But the Rocky Mountains were yet unborn, and a shoaling sea rose and fell over the land where Denver stands, when the Carboniferous age set in.

The continent was still slowly rising, and the landscape now underwent many more changes. Wide-spreading marshes began stretching away over long distances, and in the broad sea, low islands came into view; still, the water was reluctant to yield, and held its sway in regions of great extent. The shark-like fishes, many now of huger size and strange form, were busily devouring their smaller neighbors and fellow-tenants of the gulfs and bays; the tireless little coral animal was still at his work; and hosts of marine creatures found abundant food in the warm waters in which they flourished. The elements were actively scouring down the older elevations, and making deltas, bars, and shoals of their materials.

This entire Epoch was one of steadfast continent-growth, and at this time the land had outlines not greatly different from those of the later Cretaceous period, to which similarity we have heretofore referred; but much of it was not permanent land. That great area which was later to become the coal-bearing strata, embracing all the coal deposits of the United States formed in this period, was in an uncertain state; sometimes swamp land, sometimes covered with sediments, and sometimes submerged by the sea. Although the continent had greatly grown, it was still small as compared with its present size. At the close of the preceding, Devonian period, vegetation had attained an advanced growth, apparently in preparation for what was next to occur.

This was the situation in earthly affairs when there sprang up a most extraordinary development of vegetation of a peculiarly light, porous or cellular kind. The vast swamps—and nearly all of the land had then become a swamp—were overgrown by impenetrable jungles, and crowded and matted with the luxuriant growth. Multitudes of graceful, palm-like trees were monarchs of these ancient thickets in which were myriads of strange, beautiful, and to us long-lost forms of plant and bush and tree. It was an age of rioting inanimate life, the like of which was never to be again. The purpose of this abounding vegetation was finally fulfilled. The atmosphere was purified of its noxious elements and higher creatures could live upon the soil. The preservation of these carboniferous stores was effected by the packing down of layer after layer of the decayed ancient vegetation which grew on alternating, gentle upheavals of the primitive soil, while beds of clay, sand and calcareous sediment were interposed between them by the returning waters following like alternations of gradual depressions of the land.

Of this simple process, but one requiring mighty agencies, Le Conte says:

> "Imagine, then, an old coal swamp, with its clay bottom full of dead stumps and roots, with its accumulations many feet deep of pure peat, with its surface covered with late-fallen leaves, broken branches, and prostrate trunks, and the still growing vegetation shading all. Now, imagine this overwhelmed and buried by sediments, subjected to powerful pressure and slow change, and we have all the phenomena of a coal-seam, with its underclay full of roots and its roof-shale full of impressions of leaves and flattened branches."

The vast deposits of anthracite and bituminous coal in Colorado are nothing but swamp muck buried and fossilized under such conditions. Not only was there never another period in the world's history when the available supply of carbon for vegetation was so great, but never, before nor after, were those frequent and gentle oscillations between submergence and emergence so long continued. These were the agencies which buried the successive crops of vegetable jungle, so that under the influence of internal heat and the pressure of subsequently superimposed masses, it was slowly baked and hardened into coal.

Centuries of centuries trooped by while all of this was going forward, and at last brought another change. Queer suggestions of new forms of life had appeared among the fishes, some of which were presenting reptilian features; and the myriads of crustaceans, and of mollusks dwelling in shells of many shapes and hues, were adding novelties to their order of animated creatures. Hitherto, organic life had been wholly aquatic, and subsisted on food found in the sea, for the land itself had been bare in the preceding ages of suitable provender for any creature.

A leading factor in the evolution of reptilian life was the formation of the extensive marshes of the Carboniferous era. Remains of the early saurians have been found in the upper coal deposits, indicating that these new beings had appeared in the closing ages of the great era of vegetation that now drew to its end, terminating the first grand division in the recorded geological history of the earth. The Permian, minor age, into which its closing years have been set off, was a time of transitions, of the upheavals and depressions which had so often occurred before; and the land now sunk again.

In considering the consequences of these slow and gentle upheavals and depressions, it should be remembered that a subsidence, in our own times, of the valley of the lower Mississippi, of only three hundred feet, would admit the waters of the Gulf of Mexico, up to the mouth of the Ohio river. A trifling depression in northern Illinois would furnish an outlet for the waters of the great lakes to the Gulf through the very channel in which they once flowed in ancient times. A subsidence of eight hundred feet would submerge nearly all the southern and middle States.

At the close of this indefinitely protracted Primary Epoch—these long Palæozoic periods, all this plains region here, and there were then no Rocky Mountains, was again covered by a great medi-terranean sea that extended, also, over nearly all the other territory now drained by the Mississippi, and had widely extended connections with the large, almost enveloping oceans. Fleets could have sailed upon it, and a vessel might have dropped her anchor on the submerged masses which afterward became the summit of Pike's Peak.

The vast Secondary, Mesozoic Epoch, with its still greater marvels, now dawned upon the earth; that long span of ages distinguished by an astounding development of reptilian life; with its three periods, Triassic, Jurassic, and Cretaceous, representing the rise, progress, and decline of most wonderful animated creatures.

The ending of one and the beginning of another of these Grand Epochs were marked by extraordinary terrestrial revolutions which were followed by radical changes in conditions bearing upon all forms of living things, animate and inanimate. The great Appalachian upheaval came at the outset of this Epoch. Early in its Triassic period there was an enormous wrinkling of the crust below, causing the Alleghany ranges to push themselves above the flood where they might keep company with the ancient Laurentian Hills in the east, which then had stood almost alone so long, in the midst of the tide that ebbed and flowed over the beaches of their extended slopes.

Skeleton of Stegosaurus Ungulatus. (In life the creature was about thirty-five feet long.)

It is believed that these mountain-lifting processes were of great duration, and had their beginnings far back in the earlier ages; and that considerable areas of land existed in the great Utah basin region at this time. The earth was now in the first period of the long Mesozoic Epoch, which brought into the world a prodigious family of prodigious reptiles, with forms as queer as the names since given them.

Through this period reptilian life found most congenial conditions for its enormous development. New and strange forms had appeared, and the seas and marshes swarmed with uncouth creatures, fierce and rapacious, which were undisputed masters of their watery domain. Slowly developing new crustaceans and shell fish existed in myriads, and taken all in all, it was an age of life in the water, of marvelous aspects. At this time the highest order of animal was saurian in its chief attributes. No true mammals existed, no birds, and but few insects.

We shall not dwell upon the theories of Saurian development by environment, from certain fish-creatures coming down from the Devonian times, through the Carboniferous to this Triassic era. They got into the shallows, their heads were exposed and they had to change from their water-breathing gills—if it may be stated that way—to air-breathing lungs; and were compelled to adapt their fins to the purposes of legs and feet, and their jaws and teeth to a greater variety of uses. This was not quickly done, and the process involves another hopeless effort of the mind to measure off in years the period of its duration. All this region was exceedingly fruitful of such creatures in that far-off time.

Nature appears to have had fanciful moods, if we may judge her from some of her works. The seas were alive with strange marine monsters. The great Ichthyosaurus gave battle to the Plesiosaurus. Both were huge, part fish, but mostly reptile, air-breathing creatures progressed too far to live under water, but not far enough to dwell upon land. So these monstrous fish-lizards paddled around in the bays and lagoons, occasionally striking bottom and getting a hint of the use of legs, with which their successors were equipped. The waters swarmed with company for them—a masquerade of grotesque forms of fierce, voracious saurians of huge size, some being ten or twelve yards in length. Among them were the distant progenitors of many of our modern reptiles—the alligator, turtle, and so on—and of modern mammals.

In these times a most singular reptile-beast flourished and culminated his career. He was the Labyrinthodon, who had begun his development back in the Carboniferous period and had survived the trying vicissitudes of pioneer life in those changing eras, to become a connecting type, and was now to leave the stirring scenes with which he had been so long associated. He frequented the marshes and lowlands of what there was of this continent in his day, and here in the west found a most agreeable abode. He had escaped from the dominion of the water and was an air-breathing dweller on the land. With the head of a huge alligator, an animal-like or frog-like body as big as an ox, moving on four legs and with feet armed with great claws, he was a formidable adversary and an ugly object. It is well that we do not have to encounter him now.

In the strata of this period are found the remains of two or three supposed small mammals, the first-known of their order, which were a species of rodent suggesting the squirrel of our times, but immaturely developed and not clearly established.

The Crustacean and Mollusk families were not laggards in this busy era, and the fishes were not idle. All of these old forms were changing into a large variety of new ones, and many apparently original creatures placed themselves on record. The Shell-fish and Crustaceans were particularly conspicuous in their activity, and their humble lives were marked by developments as remarkable as those which distinguished the saurian monsters of the bays and seas.

In this Triassic period climates as we have them now were still almost unknown, and had little or no effect. It may be said, as has been said of them in the preceding eras, that they did not exist. An uniformly warm temperature still prevailed all over the earth, and the seas were still warm and fresh. The low Laurentian Hills far to the east, remained fixed in their primitive repose in company with their new Alleghany associates, but the Rocky Mountains were yet to come. Great marshes still stretched away over vast areas, and the forests and jungles of the Carboniferous times lingered in large expanses of the swampy lands, but were being displaced by new species of trees and plants springing from the enriched soil and under the favorable conditions of light, heat, moisture, and freedom from repressing influences. Vegetation had been flowerless and fruitless, but now came the harbingers of bloom and fruit upon plants and trees.

At the close of the Triassic period the landscape had again undergone many changes. Elevations, and dry areas of the earth's leveler surfaces, had become higher and wider as the land was slowly uplifted from the sea. The marshes had been gradually filling by materials washed down from the loftier places, and forests were extending their domain and growing luxuriantly under bettering surroundings.

The Jurassic period which now ensued, was the most remarkable of this Epoch of reptile life, and brought it to the summit of its development, with results that are weakly described as marvelously wonderful. Of them Le Conte, in his exhaustive work, "Elements of Geology," says:

> "The huge reptiles which form the distinguishing feature of this Mesozoic Age culminate in the Jurassic period. Their number and variety are so great that we can only select a few from each order for description. They were emphatically rulers in every department of Nature—rulers of the sea, of the land, and of the air."

The Ichthyosaurus had now become forty feet long, with an enormous head, in the jaws of which were sometimes two hundred large teeth; and with huge eyes fifteen inches in diameter. At the other end he was armed with a long, powerful tail with which he could thrash an enemy to death. The Nothosaurus, a monster alligator, fifteen yards long, had four good legs and feet, and was a fair traveler on land as well as in the water—a hungry and ferocious customer among his scaly relatives. A friend of his was the Teleosaurus, a long-headed, long-bodied, long-tailed variety of the ancient alligator family, conspicuous in the motley company, and at home either in the water or upon the land. With his legs removed his body would have suggested the form of a great, bone-plated serpent, rather than that of a quadruped.

A contemporary of these worthies, though probably not a friend, was the monster Hylæosaurus, a huge, compact, herbivorous reptile-beast, which could not be crowded into one of our largest freight cars if he were here to try it. He subsisted wholly upon vegetable food, took up his abode around these ancient inland seas, and is supposed to have been the progenitor of the whale and some other large mammals of far later times.

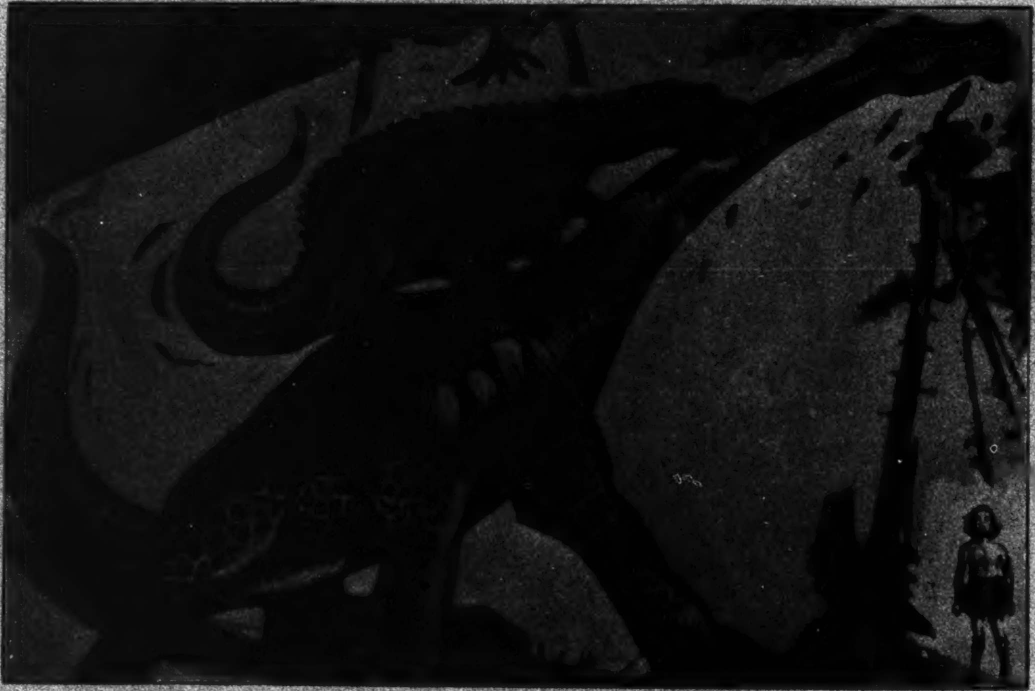
The Plesiosaurus with its small head, remarkably long, snake-like neck; stout, thick, turtle-shaped body, and its short tail, continued to do well with its length of thirty feet; while the Pliosaurus, a near kinsman of the Ichthyosaurus, and a distant relative of the queer Plesiosaurus, had elongated himself to forty feet and expanded proportionately in other directions.

The Iguanodon, an herbivorous monster, grew to be forty feet long with a bulk several times greater than that of an elephant. His thigh bones alone were near five feet long, and he is supposed to have been a mud-loving brute, after the habits of the hippopotamus.

With this pleasant neighbor was the Ceteosaur, from fifty to sixty feet long, standing ten feet high, with breadth and thickness to correspond—a most appalling beast. His thigh bones were like the trunk of a tree; about six feet long, twenty-seven and one-half inches in circumference at the shaft, and forty-six inches and forty-four and one-quarter inches in circumference at the respective ends.

But the greatest of all the monsters in this era of monsters were among those of the large family of Dinosaurs. While some of the tribe were small and comparatively insignificant creatures, others were, of all the reptilian horde, the most hugely organized, and probably the largest in bulk of any beasts that have ever existed on the face of the earth. Some of these ambitious creatures had learned to walk erect on their hinder legs, doubtless to the great envy of their less capable associates; and portentous objects they must have been as they stalked around with their bony visages looking down over the marshes and lagoons of their abiding places. Their remains were found on the Atlantic slope a half-century ago; and first discovered in the west near Canon City about twenty-five years since. The Iguanodon and the Ceteosaur above referred to were of this family.

A prodigious member of the Dinosaur species was the Camarasaurus, a recovered skeleton of one, found in southern Wyoming, and now in the museum of Natural History in the city of New York, shows that the living creature was eighty feet long, more than sixteen feet high at the hips and weighed something like ninety thousand pounds. Had he stepped on an animal the size of a horse he would have crushed it under his weight of forty-five tons. From foot to knee joint his leg measured ten feet in length; and from foot to hip joint sixteen feet. He was exclusively herbivorous, had an insatiable appetite, and he is believed to have lived to be five hundred years old. By his side a man would have looked like a mere toy creature, and more than sixty head of large horses would have been needed to balance him in the scales. While many of these monsters are believed to have died from inability in their old age to get within reach of sufficient forage to satisfy their enormous hunger, this particular individual perished by violence. Life had its troubles in those days, as well as now, and some of the vertebræ of this beast's neck were broken, and bear the marks of the huge teeth of another monster. There was at that time a smaller Dinosaur which was a flesh-eater, as proved by his teeth—a ferocious, leaping creature weighing ten or fifteen tons, which is believed to have been responsible for the larger one's death. How many meals the victim made for the victor can only be conjectured; and it is quite certain that no combat of modern times equaled that encounter.



Ideal Sketch of Leaping (Carnivorous) Dinosaur Attacking a Vegetarian Relative. (Human figure introduced to suggest proportional sizes.)

A still later discovery in the Dinosaur cemetery has revealed the remains of an individual of still more prodigious size than our acquaintance of the broken neck—of the most colossal beast whose bones have ever been taken from the strata of the earth. Think of a creature one hundred and thirty feet long, thirty feet high at the hips, and twenty-five feet at the shoulders, whose petrified skeleton weighs forty thousand pounds! Its remains were discovered ninety miles northwest of Laramie, Wyoming, in August, 1898, and exhumed almost complete in skeleton form in the summer of 1899. The others would appear as but little more than half-grown in comparison with it, and the largest elephant of modern times would be in size beside it about as an ordinary hunting dog is to a heavy draft horse. This monster was found by a party from the State University of Wyoming, and its remains are now in the possession of that institution. Of the living creature, Mr. W. H. Reed of the Geological Department of the University, and who directed the recovery of the fossilized skeleton, says:

"An accurate idea of a living Dinosaur is practically out of the question. According to my opinion, I should say that the animal now being brought to light weighed in life about 60 tons, that he had a neck 30 feet in length, and a tail perhaps 60 feet in length. His ribs are about nine feet in length, and the cavity of his body with the lungs and entrails out, would have made a hall 34 feet in length, 16 feet in width, and arched over probably 12 feet in height. Such a space, if properly arranged, would seat at least 40 people. A round steak taken from the ham of the animal would have been at least 12 feet in diameter, or more than 35 feet in circumference, and would have had a solid bone in the middle 12x14 inches, with no hollow for marrow. A set of fours in cavalry could easily have ridden abreast between his front and hind legs, provided he had not objected. Every time he put his foot down it covered more than a square yard of ground and must have fairly shaken the earth. The smallness of the head of this animal is a peculiar thing. I should say that the head of this mighty Dinosaur was probably not larger than a 10-gallon keg. He must have been a very sluggish creature, as his brain cavity would certainly not warrant the belief that that organ weighed to exceed four or five pounds."

Prior to the discovery of the Camarasaurus' fossil remains, the largest known representative of this great family was the skeleton of a Brontosaur recovered by Professor Marsh, and which was almost complete. It was restored and mounted by him in 1891 and is now in the museum of Yale University. In life it was about seventy-five feet long and weighed probably forty tons.

The Dinosaur fraternity flourished over a large portion of the United States, but appears to have been especially fond of this region along the eastern base of the Rocky Mountains, though in their time the mountains did not exist. Professor Marsh, of Yale, and the late Professor Cope of the University of Pennsylvania, began their search for the fossil remains of these and other ancient creatures, in Colorado and Wyoming in 1877, and did some of their fruitful work within sight of Denver. Continuing their researches for ten or twelve years, they inspired others to take up the work which is still being enthusiastically followed with most extraordinary results, as we have seen. Professor Marsh, who died in March, 1899, was an enthusiast in these pursuits, and as one result of his labors the museum of Yale University contains the restored skeletons of several hundred ancient creatures disinterred in our State and in Wyoming, including several of these extraordinary reptilian monsters of the Dinosaur tribe which when clothed in flesh were of almost unbelievable dimensions.

Evidently contemporary with the tribe of Dinosaurs were certain kinsfolk of theirs whose general growth went more to length and less to bulk—greatly elongated quadrupedal reptile-beasts. Of yet other mighty pioneers of the Rocky Mountain region, Le Conte says:

Thighbone of a Dinosaur; length 72 inches. (From a photograph.)

"The size of some of these reptiles is almost inconceivable. The thigh bone of an Atlantosaur was more than eight feet long, and a vertebræ of an Amphicœlas, found by Cope, was six feet to the top of the spinous process. The Atlantosaur has been estimated to have been one hundred and twenty feet long!

But the lofty pride of these ancient and prominent Colorado families was somewhat humbled about these times by the appearance of a new fashion of reptile, which could fly. The uncouth Pterodactyl was a singular combination of lizard and bat. He had not reached the dignity of a bird with its feathers, and his flying was rather a sailing downward from some eminence of the landscape. His wings were like those of a bat, and his head on a slender long neck, while it had a great alligator mouth, suggested in other respects, that of a bird. There were giants as well as pigmies among these winged reptiles that flourished on our great plains, remains of some found in Kansas showing them to have been monsters in size as well as in appearance.

However, the real birds with hollow bones and feathery plumage, appeared soon after and began flying above the geological horizon. While Professor Marsh was recovering the bones of the great reptiles, he found here in the Rocky Mountains, in the strata of this period, the remains of the first types of the feathered creatures that winged their way over that old landscape. They are now called the Archæopteryx (ancient-bird), and the Laopteryx (stone-bird), and certainly deserve their seemingly aristocratic names. They still retained reptilian attributes, notwithstanding their feathered clothing.

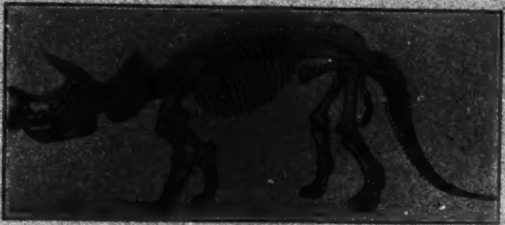
Our old, modest and retiring associates in this strange story, the Crustaceans and Shell-fish, and fine family of true fishes, were doing well their part all through these times, when the Dinosaurs were pretending not to notice the Pterodactyls. Among the encrusted and enshelled families many varieties of new and elaborate forms had appeared—curious and beautiful. The fishes were also making creditable displays in the great exposition of the period. In the sea had come the progenitor of the hideous octopus, or alleged devil-fish, and he was already making experiments, which became practices with his descendants.

The vegetation was undergoing great changes and presenting beautiful forms. Forests contained numerous growths new to this period and including most of those of the previous one, but nearly all of a kind unknown in our times, were flourishing and spreading. As might be expected from such improved conditions for vegetation, insects in considerable numbers had made their advent, about one hundred and fifty species of such flying and creeping things being known to have existed at this stage.

From the Triassic forms of the little embryo mammals, about three dozen species were now developed, Professor Marsh having found that number during his researches here. They were, with one exception, Marsupials, the strange connecting links from the reptiles to true mammals. Though they became abundant and spread over all portions of the earth, they must have had a hard time of it dodging and hiding from the all-dominant reptiles. Of the direct, little-changed descendants of these mammalian pioneers, the opossum is the only survivor in our country.

The terrestrial changes wrought in this period were vast and conspicuous, producing permanent alterations in the aspects of the partly formed continental landscape, especially in the western division. The Black Hills of the Dakotas were upheaved, the primitive Archean rocks of that region, and all that rested upon them, being projected above the surface out of the water that had so long submerged them. The inland sea became still shallower here in our own locality, and its final recession was foreshadowed. It had undergone many changes, and in the southeast, under the altered conditions, had again become broadly connected with the ocean so that nearly oceanic conditions prevailed over its deeper parts.

As this period drew near its close the surface of the earth presented the aspects of an assembling continent, more or less divided and encompassed by the sea, which was still a body of nearly fresh water, shallow near the shores, but of considerable uniform depth at a distance from their lines. The air and the water were warm, and the whole surface of the earth enjoyed a more than tropical temperature. The air was clear, and the evaporating power of the sun resulted in the downpour of copious rains which were washing away at the elevations of the land and distributing their materials over wider areas. Rivers and streams were few, and none of any considerable size.



Skeleton of Triceratops Prorsus. (In life the creature was about thirty feet long.)

But the great geological event of the Jurassic period was reserved for its close. The enormously thick off-shore rocky masses along what was then the Pacific coast were crushed together by a tremendous horizontal movement, and heaved upward into the now magnificent range of the Sierra Nevadas. But all the ridges, peaks and canons—all that constitutes the grand scenery of our mountain ranges—are to a great extent the results of erosion through subsequent ages of vast duration.

So, with this crowning achievement, the Jurassic period passed away, leaving its multitudes of huge and strange beasts, and its myriads of lesser living beings, to the decline the closing era of their long and eventful Epoch was destined to commit most of them.

The Cretaceous period was, from our standpoint, a great transitional era. The Mesozoic exaggerated forms of life were to pass out, leaving modified descendants to perpetuate their declining species, and new types, those of the ancestors of our modern forms were to come in. As the one retired the other advanced, so, that as this period drew to its close, so did the reign of the marvelous reptiles of this wonderful Epoch.

At that time the eastern and western shore lines of the continent were much farther inland than now, and the proper limits of the Gulf of Mexico were far to the north and west, as compared with their present bounds. From the Gulf extended the persistent shallow sea over large portions of this region here—but to this we shall refer again. The Pacific washed the foot-hills of the Sierras, to the east of which the uplifted basin area stretched from far down in Mexico to the distant northwest, and North America was still divided into two continents. To the eastward the permanent area of land had longer been relatively larger and was more rapidly extending. The oscillations of the central part of the continent had kept this wide separating sea going and coming, ebbing and flowing, baring the land and then flooding it again, through the past ages, but the tendency of all the movements was in the direction of its final withdrawal.

The uplifting of the Sierras resulted in great changes in the vegetation as it did in many other ways. Blooming and fruiting plants, and fruiting and nut-bearing trees became abundant. A very large proportion of the descendants of these are familiar to us in our forests, orchards and gardens now.

Many of the former marine creatures, to which we need not again refer by name, were developing, changing or dying off as best suited the purposes of Nature, but the result was a great stride forward in advancement, variety and complexity of structure, to which was added pronounced improvement in both grace and beauty of form. Among the fishes the true modern types, some of gigantic size compared with that of their present representatives, appeared for the first time. In our own times there are nearly a hundred species of fishes which have existed from this Cretaceous period, so that we may consider that the fishes now pass from our narrative, and with them we will let all their marine kindred go, also.

But our ancient, lazy reptilian friends hung on for a long time, and were most reluctant to get out of the way of the higher and better creatures which were coming. As evidence of their right to stay and live, they brought out in these Cretaceous times a few new, and in the direction of length, bigger examples than they ever had before. In the wide sea then existing in this region, and before the Rocky Mountains were lifted above its level, a huge saurian form developed rapidly and attained enormously elongated proportions. This was the Morosaurus, a ferocious monster whose growth ran mostly to length, and was the longest known among reptiles, though not the greatest in bulk. When the bed of that ancient sea was afterward elevated into the Rocky Mountain chains, the times became very hard for Morosaurs, and this monstrous creature found himself confronted by new conditions of life that were not agreeable, and that led to his extinction; but he left a great plenty of his bones here in Colorado.

They also brought forward a sort of lizard-bird, the Ornithotarsus, thirty-five feet long, standing twelve to fifteen feet high. Two of another kind, flying reptiles, here in the west, spread their wings from twenty to twenty-five feet. Still another, had toothless jaws four feet long, and an expanse of wing of twenty-two feet.

If these were not enough to establish reptilian claims to a continued existence, they had turtles thirteen feet long and fifteen feet wide across the extended flippers, remains of which in well-preserved condition have been discovered.

Finally they had developed creatures that were more bird than saurian—mostly bird. They had prepared for this a long time before, for there are the fossil records of a bird-like being whose footprints in the sedimentary rocks are eighteen inches long, who had a stride of four feet, and stood fourteen feet high; supposed to have been a huge, wingless creature like the ostrich, too big to fly with any comfort or purpose. But these newer bird-forms were good flyers and swift, and while they had the keel-like breast-bone and the general other anatomy of birds, and wore feathers, they had, for their size, abnormally long and powerful jaws or bills, in which a great array of teeth were set, above and below.

The Dinosaurs and their numerous kindred, as large as ever, if not larger, stalked through this period to their doom; and with them went the great majority of the fierce and scaly host that had developed and matured in the inconceivable span of years stretching across this closing Epoch.

There was a surprise in store for the geologists when they began their search for the remains of mammals in the deposits and formations of this Cretaceous period. They found none, though they have looked long and patiently. The Jurassic Marsupials, now expected to have advanced several stages, seem to have entirely disappeared. Of this a noted authority says:

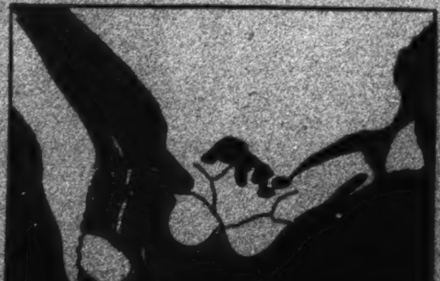
"It is the most remarkable fact that although Marsupial mammals have been found in the Jurassic, and probably existed in considerable numbers then, yet not one has been found in the Cretaceous. We know they existed at that time, for they are found in the Tertiary of both Europe and America, and still exist in Australia and elsewhere; and it is a well-established law in Palæontology that if a type becomes extinct it never reappears: Evolution never goes backward: Nature never repeats herself. It is probable, therefore, that during the Cretaceous the Marsupials which doubtless existed had been driven to some other portion of the earth, where we shall yet find their remains when our knowledge of the globe is more complete; and in them we shall also probably find the transitions or earliest progenitor of the True Mammals of the Tertiary."

The great central feature of this Epoch was its extraordinary development of reptiles. That it was pre-eminently so may be shown by a comparison of its creatures with their descendants in the present times. There are now on the whole face of the earth, only six large reptiles over fifteen feet long—three in America, two in India, and one in Africa—and none over twenty-five feet long. It may also be said that none of these bear any comparison in bulk or length with many of those of this distant Epoch, which left in the United States alone, distinct, we might say perfect, records of one hundred and forty-seven species, most of them of gigantic size; and the mountains and plains of Colorado are their crowded cemeteries.

The natural conditions which produced these wonderful results were commanding conditions. They dominated all forms of animate life. The age impressed its character on all living creatures, even on those in many respects above the ruling forms. The few mammals were reptilian mammals; the more abundant birds were reptilian birds. While the present known types of that physical life are but a fraction of all that then existed, all that are known, all that have been revealed bear certain testimony to the universal prevalence of the reptilian influences in that period of the world's history.

How have all these remains been preserved? Their situations indicate several processes. Sometimes the bones, occasionally those of complete skeletons little disturbed, are found in beds of clay or marl, as if the animals had mired down and perished in their helplessness. In other places the remains are found in sandstone strata, occasionally in masses several feet thick and so mixed up that it is difficult to assort and assign them to their original relations; this would suggest their indiscriminate deposition in favorable places along the banks of streams. Still larger accumulations are found where at one time are supposed to have been the mouths of rivers, the carcasses of the animals after death having been carried down these streams and deposited in their estuaries; as vast heaps and reefs of fossil bones are found in some places. In all their situations they were later covered by sediments in those times of frequent watery revolutions, the sediments, excepting some marls and clays, under the weight of subsequently superimposed masses, hardened into rock, and sealed up imperishably through all succeeding ages the bone-forms of these ancient creatures. Thus they are found between or imbedded in the rocky sheets—the great leaves of Nature's record book. These processes were accompanied by conditions that did not invite rapid decay and disintegration; and therefore we may see to-day the fossil bones, perfectly preserved, of beings which lived and died probably millions of years ago. It is believed that through the later geological eras some of these fossilized remains became covered with from twenty thousand to thirty thousand feet of strata. The upheaval by which the Rocky Mountains were formed tilted these vast beds, and subsequent erosion by the elements has thus brought to light what is left of creatures that lived and flourished in these remotely distant Mesozoic ages.

The fishes of these ancient times have been preserved in the rocks of Colorado in prodigious numbers. In many places along the South Platte in the vicinity of Denver the exposed strata contains hundreds of them, their forms perfectly preserved in a fossilized condition, and their crystallized coverings frequently presenting iridescent hues. In the northwestern part of the State, along the tributaries of the Green river, there are multitudes of them.



North America in Cretaceous Times.

Colorado is a vast Golgotha for myriads of the creatures of these Epochs and those of subsequent ages. The strata of the San Juan region for hundreds of feet in thickness is especially rich in the numbers and varieties of these relics of ancient life.

Many curious and beautiful results of petrifaction are found in abundance, in the fossil wood of this region. Trunks of trees, branches, stumps, are converted into objects of most beautiful varieties of color and shading, which are revealed by cutting and polishing the material. The grain, texture and foldings are faithfully retained by the minerals which have replaced the original matter. This is exquisitely shown where there were knotty places in the ancient tree. These fossils are frequently found in ancient river-drift, showing that the wood had been carried there before the change set in. In the mountain-elevations of a later time they lie where they fell, and where they have rested for thousands and thousands of years.

The Cretaceous era, the third and last division of the strange Mesozoic Epoch, closed upon an earth that presented continents with outlines foreshadowing their present figures. Through its ages the wide, inland sea extended northwestward here in our country, covering the region of the great plains and the Rocky Mountains as far west as the present Wahsatch range, and it is believed on to the Arctic ocean, dividing North America into two continents of comparatively limited area, with islandic places like the Black Hills, standing above its surface. But it was slowly narrowing and receding, though its shallow waters still covered considerable areas of the land, with low islands and tongues of soil emerging here and there.

The great deposits of the varieties of coal called lignites, so abundant in many large sections of Colorado—one vast measure of it underlying Denver and extending in a wide belt beneath the foothills and the plains from Pike's Peak northward into Wyoming—were formed during this period. Remarkable changes had occurred in the luxuriant forest growths. The old Carboniferous species were fast passing away, and some of the trees of our own times had made their appearance. The oak, beech, hickory, maple, walnut, poplar, sycamore, sassafras and willow had their representatives in the woodlands of the closing ages of this period, with those of the laurel, myrtle and fig. More and dryer and better soil gave vegetation a sounder and harder fiber, and a less riotous growth was one of the results.

The warm temperature of air and water had continued, in modified degree, but atmospheric and terrestrial conditions were more greatly changed. Frequent deluging rains had scoured down the land and the slow rising of the continent combined with the consequences of this erosion, was fast enlarging the expanse of marsh and lowland.

Another tremendous terrestrial revolution was now impending. The land had been, as of old, rising and falling preparatory to its practically final adjustment much as we have it now, and the tide was ebbing and flowing over its changing shores, as the giant, weary of his old position, was preparing himself for a new one, like a restless sleeper who causes the covering upon him to rise and fall in harmony with his movements.

As this great Mesozoic Epoch was inaugurated by the upheaval of the Alleghany ranges, its Jurassic period marked by the elevation of the Sierras, its closing, Cretaceous, era ended with a vast addition to the work of making the continent. The lofty mountain ranges of the Rockies began to slowly raise their heads from the welter that so long had engulfed them. The whole western half of the continent was bodily upheaved, not suddenly, violently nor explosively, but with a steady, majestic movement that was the beginning of the end of continent-making. The slow movement upward, caused chiefly by horizontal shifting, but greatly assisted by internal pressure, produced the series of tremendous continental wrinkles that constitute these mountain ranges. The enormous buried masses of stratified rocks were crumpled as sheets of paper may be between the hands, crushed together, heaved upward and left standing almost vertical, cracked, split, broken, as our miners find them now, in confused masses, and shoved up into the clouds, through the closing ages of this Cretaceous period. In some places small areas escaped the general dislocation and disruption. The beautiful mountain parks of Colorado were lifted like bowls, retaining waters that had formerly swept over them and which now made them mountain lakes, or little isolated seas, and kept them so for untold after years.

This terrestrial revolution abolished the great interior sea which had previously divided North America into practically two continents, and permanently elevated, at last, the land of the Denver region.

CHAPTER II.

Outlines of Geological History, Continued—Tertiary Epoch and Changed Conditions—Revolution of Life Systems—Prolific Ages of Mammals—Continental Changes—Quaternary Epoch—Age of Glaciers—Period of Floods—Final Continental Adjustment—Effects of Erosion—Quaternary Mammals—Pioneer Man on the Western Hemisphere.

The tremendous achievement by which the Rocky Mountains were formed, as with the older lofty elevations of the continent, was attended by violent volcanic action. As the masses of stratified rock were slowly uplifted they reached a point where the strain could no longer be resisted, broke apart in places along the crest and released the molten matter of the interior which poured forth with tremendous energy in fiery torrents which did not cease to flow for many years—for ages. This upheaval brought the precious and other metals to or near the surface, and placed in accessible position the broad foundations of Colorado's prosperity.

These enormous physical changes were followed by climatic changes correspondingly great. These changes were potent in closing the careers of the huge reptilian forms of animate life that so long had dominated in countless numbers and endless variety, on land and in sea, and which now passed away. They also prepared for changes equally great in the lesser forms of life, and in the character of vegetation with which the country was overspread. The earth was again on the threshold of a new Epoch with its new conditions, new types of living creatures, and new aspects of land and water.

A great depression is still a physical feature of the mid-continent; the Mississippi flowing southward through it, and the Mackenzie, the Mississippi of the north, draining it into the Arctic ocean—a condition provided for by this final revolution in continent-making at a time when the generations of men were yet slumbering in the chambers of the future.

The inauguration of each of these great Epochs, it is to be remembered, was characterized by a geological revolution—disruptions, upheavals, emissions of heat and vapors from beneath the crust, dashing of waters against coast barriers, destructive ocean tides, and streams, and the more or less complete extinction of the living beings that were developed in the preceding Epoch. In the repeated changes that were wrought the grain of sand upon the streamlet's border may have been incorporated successively into a dozen different formations, each in turn disintegrated to be inwrought in the rocky sheets of the next following age.

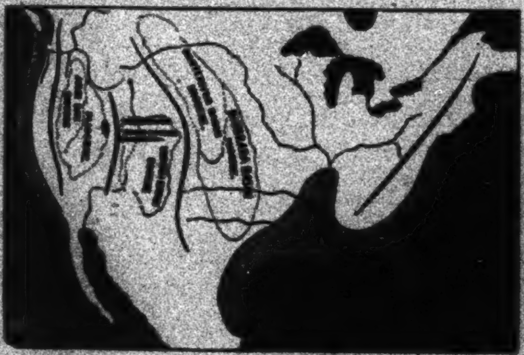
As to these Epochs, the human mind, as we have heretofore remarked, is destitute of ability to form any conception of their length in years. Terming them epochs, eras, ages, and periods, is only employing words that convey no intelligent part of their true import as limitations or divisions of these enormous lapses of years. They were, however, apparently of different lengths. The Carboniferous was nearly as long as the Silurian and Devonian combined; the Cretaceous more than equal to the Triassic and Jurassic, the latter being much the shorter of the three forming the Secondary Epoch; while in the Tertiary, which we have now reached, the Eocene period seems to have been nearly as long as the Miocene and Pliocene periods put together, with the latter very much the shorter. These are the suggestions presented by the relative thickness of the strata of each period; but it can not be properly assumed that they are conclusive. The conditions of one period may have been such as to result in much larger sedimentary deposits than those of another, and in some instances there are indications that they were so. This renders almost gratuitous any attempt to define even the relative duration of these long eras of wonderful processes.

In this connection it seems proper that we should state that we have termed these grand divisions "Epochs," and their sub-divisions "periods," for the reason that they seemed more convenient forms of expression. As strictly technical terms they are not employed just as geologists would use them, but for purposes not intended to be technical, they may be admissible.

With the Third—the Cenozoic Epoch, the transition from the ancient to the modern geological history of the earth is held to have begun. Cenozoic conditions with modifications continued through all the succeeding ages to our own times, and some of the authorities consider them as having been parts of one great Epoch. But for our purposes here we will regard the periods as constituting two Epochs, the Tertiary and the Quaternary, a division authorized by many authorities. The Cenozoic inaugurated the commencement of things, and of many forms of life, as they now are.

North America had become a continent, as the accompanying map indicates, not greatly different from its present outlines. The southeastern coastline of the Atlantic was farther inland, submerging Florida; the Gulf of Mexico projected up the Mississippi valley in a broad tongue-shaped form to the mouth of the Ohio River, and covered Louisiana and most of Texas; on the Pacific the Sierras were the coast line; the Coast Range, the last of our great mountain chains to be formed, having been yet beneath the waves of that ocean. In the three different periods of this Epoch great lakes of fresh water successively existed here in this western region. These also are shown upon the map. The oceans were not yet more than brackish, and the climate was so mild and salubrious that evergreens, palms and figs grew as far north as the Dakotas, indicating gentle conditions such as Florida now enjoys.

If the reader could be taken back over the years and placed on an eminence in this ancient landscape he might look down upon a country of fair prospects, far more luxuriant in its vegetation than it ever has been in modern times, but much the same in its principal physical aspects. He would, moreover, be the only human being on the face of the earth, and the first to gaze upon Nature's wide expanse of land, lake and stream, unchanged by the presence of that most restless of all created beings, man.



North America in Tertiary Times. (Dotted lines indicate places of Tertiary fresh water lakes; black lines, course of mountain chains.)

Vast changes had occurred. The great reptiles were gone, leaving only a few of their emaciated and impoverished descendants; the whole life-system was revolutionized. The sharks and whales were commanders in the watery dominions, some of the former being seventy feet long, and armed with angular teeth six and one-half inches high and six inches wide at the base; birds flew in the air and sung in the trees; animals of all sizes from small to huge, some of whose presumed descendants are with us now, roamed over the rich savannas or secluded themselves in the fruitful forests and jungles; insects and creeping things had begun careers, of which many are not yet ended; and the sun smiled down upon a vast region of abounding fertility and exceeding beauty.

Plant-life now began to flourish, under what would seem to us to be natural conditions, in the first, the Eocene period of this Epoch, and brought forth new and beautiful forms, numbers of which exist to this day, but which then found favorable circumstances in latitudes much farther north than they may now endure. Greenland and the sub-Arctic Canadian territory enjoyed temperate, if not tropical, climates and their results; the cypress and the magnolia of Louisiana grew around the lower end of Hudson's Bay. The Big Trees of California date their ancestry in these Tertiary times, and our oaks and the other familiar forest friends which are already noted as having come in the Cretaceous period, were now venerable patriarchs in the far-reaching woodlands. The minor plants and herbage had changed in character so much, and had become so near alike many we know so well, that our solitary visitor to this country in these old times would not have felt himself to be a stranger in a strange land. Through the Miocene and the Pliocene periods, and into the Quaternary Epoch, these developments, and confirmations of familiar identities in trees, and plants and flowers, went on, until nearly all we now have were gracing the ancient landscapes, in type and form much as we may see them now, and until primitive man had come to enjoy the fruitfulness with which they were so abundantly endowed.

While these higher orders of vegetation were so abundant, probably more abundant than now, so were some of the very low orders—perhaps more of animal than vegetable character. Vast deposits, made in Tertiary times, of the lowest order of single-celled organisms, have been observed in California and elsewhere. These consist wholly of the silicious shells of these microscopic objects, and they are so small that a cubic inch of this infusorial earth, as it is called, is estimated to contain the remains of forty billions of them. These atomic creatures still exist in the frigid parts of the oceans; and the ooze in the deep places in Lake Tahoe, where sediments do not encroach, is composed wholly of such infusorial shells.

Through the three periods of this Epoch enormous numbers of Mollusks existed, the Tertiary rocks embracing vast masses of their fossilized remains. It may be stated here that the Tertiary oyster, if it possessed in corresponding degree the flavor of its modern descendant, would have delighted the eyes and stomach of the epicure, for the California and Oregon variety filled a shell thirteen inches long, eight inches wide and six inches through. Of the shell-fish of these old times a considerable number survive.

It is so with insects, too; the bees, butterflies, ants, and many others of that time closely resembled their representatives present now. In a broad sense, this may be said of all the invertebrates, the differences in many instances being apparent only to the trained observer. It is only among the genera and species of mammals that the changes have been conspicuous from those times to our own.

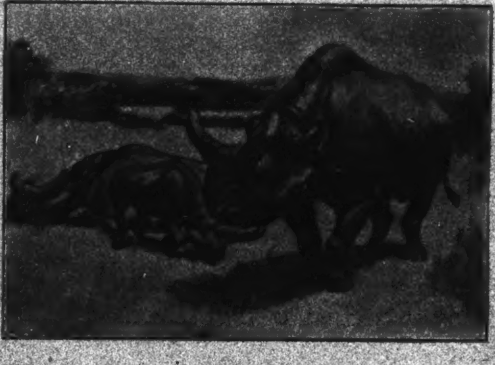
Great masses of fossilized insects of this Epoch have been found in Colorado. In beds of them buried in the fresh-water shales at Florissant, the remains of over one thousand different species have been recognized. The curious manner in which some of these Tertiary insects have otherwise been preserved calls for brief mention. They are frequently found in amber, the fossil resin of coniferous trees, often quite transparent, and in which may be seen the perfect forms of the insects; the slender legs, the gauzy wings, and all the delicate parts as they were when the creatures were endued with life. The manner in which they were entangled, enclosed and preserved may be observed in our own times. The gum issuing from such trees is at first in the form of semi-liquid transparent tears. Flies, gnats, and other insects alighting on these, stick fast, are enveloped by the further exudations, and thus preserved indefinitely. The legs of these little prisoners, both in modern and fossil resin, are often found broken by the struggles of the insects to extricate themselves.

But it will be among the fine array of mammals of this Epoch that we will find subjects of the greater interest. We shall no longer consider the periods separately as we have those of preceding Epochs, for the reason that in this one the dividing lines are less distinct, and the circumstances of the three Tertiary divisions blend more smoothly into each other. Beside this, we have passed the eras of continental revolutions and their consequent revolutions of life-systems.

At this juncture it should be said that the elevation of the Rocky Mountain ranges was probably not completed until long after the advent of Tertiary times. The presence of fragments of Tertiary rocks on the summit of Long's Peak seems to testify that the front range of Colorado's mountains was not completed as to uplift until far into the new Epoch.

Our overgrown reptile friends and their associates had long since made their adieus. We have reminders of them in Crocodiles, Turtles, Snakes, Frogs and Lizards, but the rulers of the animate worlds were now the mammals and the birds. In the deposits of the Eocene period in Wyoming five species of Snakes, some of them eight feet long, and nine kinds of Crocodiles, have been found. In other countries, in the formations of this Epoch, have been discovered the fossils of the last reptilian effort to produce gigantic forms. This was a Miocene turtle with a shell twelve feet long, eight feet wide, and seven feet high in the roof. From point of extended head to tip of projected tail the creature probably had a length of twenty feet. After this the whole reptilian tribe sunk to its present unimportant and uninteresting level, abhorred by man, bird and beast.

The mammals appear to have come in with a bound, and the geologists can account for the apparent suddenness of their advent only upon the hypothesis that there was another of the lost intervals immediately preceding them. In the early ages of Tertiary times the earth seems to have swarmed with animals. This was conspicuously so here on the plains and in the Rocky Mountains. The rapidity of development and swiftness of succeeding changes is attributed partly to the pressure of changed climate and other natural conditions, and partly to the migrations of different species. Even the order next to man in higher development, the Monkeys, appeared in the throng. These, however, were not the higher types of Monkeys, but lemurs, which are held to have been the connecting links with other orders. Of one of these creatures, the Mesopithecus, the fossil bones are found here along the eastern slope of the Rocky Mountains and in other parts of Colorado. In the San Juan region and in that of Green River, Professor Cope found eighty-seven different species of vertebrates, two-thirds of which are mammals. The geological cemeteries of Colorado abound with such relics.



Titanothere Family—Bull, Cow and Calf—and Ideal Tertiary Landscape.

While types of general orders survived, the definite species of ancient mammals changed completely several times in the course of the Tertiary Epoch. These changes produced remarkable results all over the earth, but nowhere more than in our own country, and especially here in the west. Other parts were also prolific. In the Gulf States a marine mammal, the Zeugloden, an ancestor of the whale, left skeletons of a length exceeding seventy feet. In places their vertebræ, eighteen inches long and twelve inches in diameter, are so numerous in the soil that planters have used them for making fences, and have put them in heaps and burned them to rid the land of such incumbrances. In the Gulf States nearly all the remains are of marine mammals of varying proportions; but things are different when we turn to the region of the Rocky Mountains, where the records are continuous and the most complete which have ever been revealed anywhere.

The beds of the Colorado mountain basins, and those of other ancient fresh-water lakes here in the west, have yielded still greater results to geological explorers. Among the earlier of the Tertiary mammals were many conspicuous for their size or physical peculiarities. The Paterofeles was a great Tiger and, as its name suggests, the progenitor of the Cat family. The Mesonyx was another large carnivorous animal of the same species, which appears to have soon become extinct. The Coryphodon was a beast like the Tapir, but some individuals grew to be as large as an Ox, and all flourished in extraordinary numbers. The Paleosyopos was larger than a Rhinoceros, had a horn two feet long on the end of his nose, and wore a thick hide that was studded with protuberances like door-knobs. The Dinoceras was of the Coryphodon type, a creature of more than elephantine proportions, but not an Elephant, for he had only the rudiments of a trunk. To compensate for this deficiency, he had six huge horns—three pairs—on his head, like those of a Rhinoceros, but much larger; to these were added canine teeth eight inches long. Altogether he was well equipped for offensive or defensive warfare, if his enemy would keep to his front. The Tinoceras was a relative, but much larger, his skull, alone, measuring four feet in length. It was also fitted with a similar number of huge ripping-horns and tearing canine-teeth. The Metamynodon was a swimming Rhinoceros much larger than his modern namesake, but otherwise resembling him. The Hyracodon, a relative of the other, and sometimes referred to as the "running Rhinoceros," had developed into a beast much like a Horse in appearance, and was quick and light in its movements. The Elothere might be described as a giant, two-toed Pig, but notwithstanding its resemblance to our modern animal, it was really not a Pig. It was a huge creature with a skull four feet long. The Titanothere—giant beast—was the largest of his times, and flourished in great numbers in the ancient lake country bordering on the base of the Rocky Mountains. He was herbivorous, twelve feet high at the shoulder, sixteen feet long, and the culmination in the development of an old race of mammal beasts. He had two huge ugly strong horns on his snout and was well-nigh impregnable unless attacked in the rear. The Uintathere, a kinsman of the Titan, was a big, stupid animal with a body the size of an Elephant's, short legs, and a brain no larger than a Dog's. His career was brief and he early became extinct—probably from lack of wit to take care of himself after smarter creatures with sharp appetites appeared.

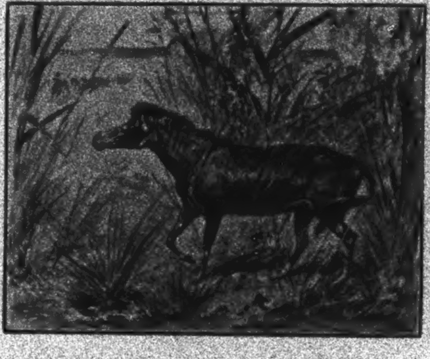
But the strangest revelations of the Tertiary beds of this region are the remains of the Eohippus, the earliest horse, a little animal, four hands or sixteen inches high, and no larger than a Fox; having three toes on the hind feet, and four perfect ones, and one rudimentary, on the front feet. The remains of these queer little creatures, which did not stand much above the ankle of the Titanothere's front legs, and which were the ancestral relatives of our modern Horses, are found wherever the Tertiary rocks are exposed.

Toward the middle of this Epoch the progenitor of the Deer family appeared in the Protoceras, an animal of light and graceful movements and much in advance of his immediate predecessors. Another new type, or a highly developed old one, was the Oreodon, a creature intermediate between the Hog, Deer, and Camel, and which roamed all over the country west of the Missouri river to Oregon.

Most of these earlier Tertiary mammals were herbivorous, the carnivori having been decidedly in the minority. Their remains are found principally in the bed deposits of the fresh-water lakes, which were of great extent here in the west at different times in this Epoch, as the map of the Tertiary geography shows. About ten thousand feet of strata accumulated over the graves of these creatures, but between the tilting of the rocks by slow upheaval and the persistent effect of erosion, their bones have come to light in many places. It is to be remembered that the Rocky Mountains were once much higher than now, probably three times higher, and that the washing, scouring, and leveling of all this region has been going on all the time through many ages.

Of the Tertiary mammals already mentioned Professors Cope and Marsh recovered, principally in Colorado, the skeletons of one hundred and fifty individuals, and during their researches in our State Professor Marsh came upon the remains of a group of extraordinary animals which had the head of a Bear, the body of a Tapir and the teeth of a rodent.

As the Tertiary Epoch passed into its third and last period much of the fauna of this region assumed the forms and character of creatures familiar to us. In the upper strata of this Epoch are found the remains of the Elephant, of a Mastodon smaller than that of the succeeding eras, and of many carnivorous creatures which flourished in those days. The relics of Wolves, Foxes, and Cats are present, and with them those of Moles, Squirrels, Bats, Marsupials, and many little Monkeys. Out on the plains, in places where erosion has done much work, there have been collected by Professor Hayden the fossil bones of nearly forty different species of mammals of the closing Tertiary period; among them being those of the Hyena, Wolf, Tiger, and Panther; and of the Rhinoceros, Deer, Camel and Horse families. Camels were quite abundant, and appear to have survived until comparatively recent times, for their remains are scattered over large areas of the plains, and in the river valleys to the eastward. Both the Camel and the Horse seem to have originated, says Le Conte, on this continent instead of on the eastern; and they appear to have multiplied to such an extent here in the west, that Professor Dana says "the large number of camels and horses gives a decided Oriental character to the fauna." These later Tertiary animals were nearly all connecting types, but the cavities in their skulls show them to have been, for their relative sizes, remarkably small-brained creatures—unusually so.



Progenitor of the Horse—sixteen inches high.

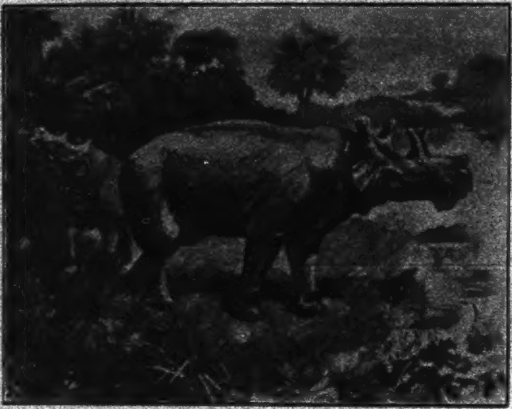
On the other side of the earth animal life developed forms not yet found on this side, but that does not necessarily imply that they were not here. They simply have not been found. Among them were many singular beings. Scores of American types have not yet been found elsewhere, but this, also, is not conclusive. It is, however, believed that numerous orders originated here, and that they or their descendants made their way into Asia and Europe by way of the northwest where, in ancient times, there was a direct connection by land, which has left evidences of its former existence. The same may be said of the great reptiles of the Mesozoic period—that they populated the seas and early land of the eastern hemisphere by the emigration thither of their descendants; though, of course, the land avenue to that side of the world was of no utility to the strictly marine branches of that large and singular family.

Up to the Tertiary Epoch all bird-like creatures, as elsewhere briefly stated, had been more or less reptile birds; that is, they were dominated in varying degree by the surrounding reptilian conditions and influences from which they had sprung. Now there were true birds of many kinds through these approaches to the geological modern ages. Here there were Eagles, Hawks, Woodpeckers and many others of our familiar feathered friends. There were also birds of which we have no present representatives, and some of gigantic proportions. In 1877 Professor Cope announced his discovery, in the vast fossil beds in the San Juan basin, of a bird twice the size of the modern Ostrich and much resembling the fowls of that ornithological family.

During this Epoch some, but not all, of the terrestrial finishing touches were given the continent. The ancient Cretaceous sea which divided the continent through here from the Gulf of Mexico to the Arctic ocean and covered the site of Denver, had been obliterated by the continental upheaval which made the Rocky Mountains and raised the plains to the light of the sun, at the outset of this Epoch. During the Eocene period there appeared several great lakes of fresh water in the plateau region west of the Colorado mountains. At the close of the Eocene there was a rise in that plateau which drained off its lakes, but caused a depression here in the region of the plains, not sufficient to let in the sea again, but enough to form extensive, shallow, fresh-water lakes, in the succeeding Miocene period.

At the close of this second period occurred the great terrestrial event of the Tertiary Epoch. The off-shore sea-bottom of the Pacific was jammed into crumpled folds by an irresistible horizontal contraction of the earth's crust aided by internal pressure, and the western Coast Chain of mountains was thrown up. As of old, the crests of the folds broke apart and there ensued a season of most violent volcanic activity which flooded large areas of the newly-made country with enormous quantities of lava, and which is not yet at an end, if the recent report (autumn of 1898) of the discovery of a smoldering volcano in the distant part of Alaska shall prove to be true. With the Coast Range upheaval there came a further slight depression of the plains, and a lowering of the Utah basin. So, in both these regions large fresh-water lakes existed through the Pliocene period, and which did not disappear until the final continental adjustment was accomplished in the succeeding Quaternary Epoch. But the western side of the continent was practically finished in all the region lying between the latitude of Denver and the waters of the Pacific Ocean.

One consequence of these Tertiary contributions toward continent-making was to greatly increase the erosive power of the comparatively small and sluggish streams of the western basin. The Miocene depression of that section probably checked it for a while, but it is believed that in these eras the Colorado river began its mighty work, of which we will give some account in the succeeding pages.



Ideal Tertiary Landscape and Great Four-Horned Uintathere.

We now come to some consideration of the fourth and last of the Grand Divisions of the geological history of the earth — the Quaternary Epoch, the one possessing for mankind the greatest direct interest, for it brought man into the busy scenes of action. It, also, has been separated for us into three periods, the Glacial, Champlain, and Terrace.

The crust of the earth was not yet at rest; there were to be many oscillations, before quiescence came to it. The first of these, in which everything in high latitudes was lifted from one thousand to two thousand feet, clear around that belt of the world, was followed by great climatic changes, and by one of the most extraordinary phenomena in the known history of the globe.

This upheaval in the north changed that region from its semi-tropical character over large portions, to one of most rigorous cold. Whether this alone was responsible for what now ensued is not within our province to discuss at any length. But about this geological time there accumulated in the Arctic regions enormous masses of snow-ice which were constantly augmented until a prodigious polar ice-cap was formed. Urged and pushed by the weight of its persistent accretions this mass moved southward. Increasing in size as it proceeded, it became an enormous winding-sheet of ice, from three thousand to six thousand feet thick. This gigantic ice-mantle moved on slowly and majestically southward, its magnitude and weight steadily increasing, until it covered the upper half of the entire northern hemisphere. In the Mississippi valley its most southerly point was about the junction of the Ohio river with the Mississippi. From that termination its huge and rugged front bore away northeasterly, and northwesterly. In the west it extended over the larger part of Kansas, and thence lined away northwest into Montana whence a huge peninsula projected southward covering the Rocky Mountain region to a point below the southern limits of Colorado, and which was its farthest extension south on any part of the globe. The invaded area of the Pacific slope was of relatively smaller extent, and the whole is fairly indicated by the accompanying map. The general southern limits may be plainly followed in the wreckage left, clear across the continent from the Atlantic to the Pacific. Similar conditions prevailed across northern Asia and Europe, extending there to about fifty degrees north latitude.

From its lofty advancing wall this great sheet stretched out huge icy fingers that were enormous glaciers in themselves, and which projected far away from the parent mass. These frozen fingers lent to the southern line of the mantle the aspect of an enormous comb. The radical climatic changes covered the Rocky Mountains here with a shroud of ice hundreds, perhaps thousands, of feet thick, which spread over their slopes, down upon the plains, covering the land where Denver stands, and far beyond, as with a great blanket. From this mountain mass lateral glaciers pushed out, creating vast physical evidences of their presence, which permanently exist in many places.

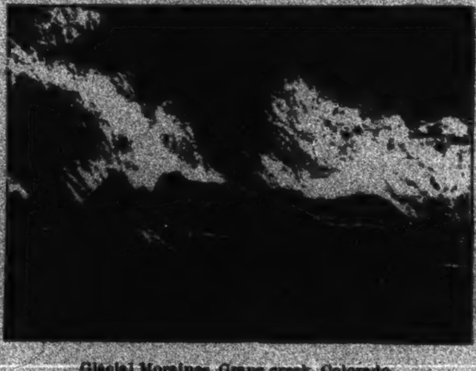
The consequences of this extraordinary visitation were tremendous all over the country. As the great mass irresistably moved forward, it crowded before it the soil of the earth, ground and crushed the rocks it encountered, and bore with it prodigious quantities of debris accumulated on its way.

When the movement ceased and climatic conditions again changed, as both eventually did, the icy mass began slowly melting away under the restored power of the sun over these enveloped latitudes, and rivers and torrents of water flowed from its mighty breast. After it had retreated to the far northland of its birth, the uncovered land it had overwhelmed, revealed the tremendous changes its presence had wrought over the face of the country. Pre-glacial rivers, of which traces still remain, had been buried; hills and valleys had disappeared and new ones in new places were in existence; the land was strewn with vagrant bowlders which had been fragments broken from granite ledges in the distant north, rounded by the grinding they received while on their reluctant journey, and left behind when their master retraced his steps. The system of great lakes was formed on what before had been an elevated plateau through which ancient rivers flowed on their way to the sea. The marks and seams and scars left by this prodigious engine are visible to this day over the large area of the United States, upon which it extended its mighty power.

The ice sheet did not continuously retreat. When its front had retired to the northern latitudes of the United States it paused, and then seems to have advanced again as if determined to renew its attack on the country it had invaded. This intention, however, was reconsidered, and the final retreat was made.

We shall not attempt to enter upon any detailed consideration of the theories advanced to account for this strange phenomenon. It is, with geologists, confessedly one of the most difficult problems with which they have to deal; and they do not offer us any explanation which to them meets all the circumstances of the situation. They know that an Arctic terrestrial upheaval of from one thousand to two thousand feet occurred, and that this would and did cause important climatic changes over North America, and was partly responsible, at least, for the extremely frigid climatic conditions which ensued. But that this elevation, in itself, was capable of producing consequences so extraordinary, is not clear—not acceptable to those especially qualified to judge.

Of the many theories advanced, one is that there was subsequent subsidence of the Arctic area, and that in the interval between elevation and subsidence, the effect of elevation there was sufficient to cause what followed. Another is that the chief causes were cosmical. This theory, originally advanced by Croll, has received much consideration, and is, Le Conte says, the only one of the kind entitled to serious attention. Wright also regards it worthy of attention, and so do many English geologists. It attributes the phenomenon to "the combined influences of the precession of the equinoxes and secular changes in the eccentricity of the earth's orbit;" and therefore provides for a recurrence of maximum north-polar frigidity with similar continental consequences, once in every twenty-one thousand years, just as it has occurred with that periodicity in all the ages of the past. The details of this theory involve astronomical problems to which extended reference here would be out of place.



Glacial Moraines, Grape creek, Colorado.

This great moving mantle of ice strewed all the country it visited with vast miscellaneous deposits of geological rubbish. The deposits are mixtures of clay, sand, gravel, pebbles, angular stones of all sizes, unsorted, unstratified, unfossiliferous. Much of this was distributed and heaped into great banks and bars by the torrents flowing from the glacier's melting front, when its recession set in. Bowlders, many of enormous size, of granite and other alien rock, were left scattered promiscuously over the region hundreds of miles from their parent sources. On removing this drift-covering, the country rock on which it rested is found polished, planed, plowed and scratched, the markings always consistent with the direction of the glacier's movement. Modern glaciers leave, on a small scale, just such evidences of their operations.

The divisions of this Epoch—the Glacial, Champlain, and Terrace periods—were short as compared with the long eras of the preceding Epochs, and the last two were much shorter than the age of ice. This renders it expedient to consider the Epoch as a whole, rather than to take it up by periods, in what may be further said about it. As stated, in preceding stages the continent and its landscapes presented modern general aspects as they were before man began his work upon them; life in the sea and life in the air were, practically, as they now exist; mammalian life was in a transition stage; and over all man was about to assume command.

But the earth was not yet to be at rest. After all that had been done; after all the long ages of development through which the world had come from chaos to seeming completeness; after it had at last become a place of grandeur and beauty, there was to be another visitation by flooding waters, drowning vast areas of the lovely landscapes.

At the culmination of the Glacial period, the previously upraised regions of the north began to sink, and continued to do so until there was a subsidence of from five hundred to one thousand feet below its present level. This brought on a time of submerged sea-coasts, flooding inland lakes, and wide-spreading rivers. These conditions existed in Europe as well as in North America. The Atlantic came far in upon the eastern water-shed and the Pacific encroached upon its new-made coasts; in the central region vast fresh-water lakes were formed; from the Dakotas stretching far to the north a great inland sea of fresh water came into existence, its surplus flowing both northward and southward, and receiving from northern glaciers huge icebergs which floated on its bosom. West of the Rocky Mountains similar lakes covered large districts, though not to such an extent as they did to the eastward of the mountains. Salt Lake, however, was nine hundred feet higher than its present level, and flooded the larger portion of Utah. The obstructed and embarrassed rivers added to the flooding by spreading over their valleys, and the land was burdened by the excess of water. This was not, it is to be understood, a continental submergence, but rather a flooding of the relatively lower portions of it after the northern depression had occurred.

It is thought that the inauguration of this subsidence, and the consequences which then ensued may have been instrumental in causing the recession of the great glacial movement, but the events of these eventful times can not be definitely outlined. It is a comparatively easy matter for the geologists to tell us what was done, but when they consider when it was done and how, and what were the potential causes, the circumstances are quite different. It is held probable that nearly all existing lakes in North America may date their origin in these two periods of the Quaternary Epoch. During these watery times enormous quantities of sediments were deposited upon the flooded regions, and constitute the most conspicuous geological feature of the period. But there came, at last, the final continental adjustment, the northern regions rose again, to their present levels, carrying with them in lesser degree the regions of the south, the flooding water drained into the oceans, and the continent became as we know it now.

This was effected principally in the Terrace period, which ended with the advent of modern geological times, and has its name from the great river-terraces in that part of the continent east of the Rocky Mountains, and which the streams cut out of the flood-deposits of the Champlain period. In explanation of this one of our authorities says:

> "Nearly all of the rivers in the eastern portion of the continent, over the Drift region, are bordered with high terraces, which have been cut wholly out of an old flood-plain deposit belonging to the Champlain Epoch. In fact, these rivers show first an elevation, then a depression, and finally a partial re-elevation; in other words, all the oscillations of the Quaternary period are recorded by them.
>
> "An examination of the rivers north of the fortieth parallel shows: (1) An old river bed far deeper and broader than the present; (2) this deep and broad river bed is filled up, often several hundred feet deep, by old river deposit; (3) into this old river deposit the shrunken stream is again cutting, but is still far above the bottom of the old river-bed. This cutting into the old river-deposit produces bluffs and terraces on each side. It is evident that the great river bed was gouged out during the Glacial Epoch; the filling up took place during the Champlain, and the cutting and terracing during the Terrace Epoch."

The causes of these flooded conditions in the times of the final adjustment of the continent were several. The depression of the land by which the sea entered into old estuaries, and low places, it had occupied in earlier ages; the great abundance of water supply from the melting mantle of ice; and the smaller angle of slope of the rivers, by reason of which the waters in their lower parts ran off less rapidly, and therefore were more swollen; and therefore, also, deposited greater quantities of sediments on the areas covered, which they otherwise would have carried out into the deep sea.

Terrestrial movements and phenomena were now ended, and earthly peace had come at last. Plants and invertebrate creatures were almost identical with those we have now, with but one suggestive qualification; the preserved plants and shells indicate an Arctic climate then in now comparatively temperate regions. The species found are still living, but living farther north, plainly pointing to a migration of species northward after the Glacial times.

Erosion by the elements effected results in the present aspects of the continental landscape second only to those of the great uplifting terrestrial revolutions. Much of the mountain ruggedness we see is the consequence of atmospheric and other chemical action, assisted by the motive power of water and the mechanical scouring effect of the sediments borne along by its currents. The mountain peaks and domes owe much of their present outlines to these agencies; the canons and gulches are their work; the slopes of the plains, of the river valleys, the isolated buttes and pinnacles like those of the Garden of the Gods, are all the workmanship of the elements in which water performed nearly the whole of the labor. Acting upon physical conditions created by the terrestrial revolutions, one of which was a great interior depression in central North America, and the other mountain ranges in parallel contiguity to the oceans, it has scoured and scoured, carried and carried, levelled and levelled, gnawing away at the land and bearing it off to the depths of the sea; it has tirelessly, ceaselessly followed its purpose to distribute the continent over the floor of the ocean, and bring back again the surface dominion of an universal, world-enveloping waste of waters. How long it will take to regain the command of the globe it possessed in the childhood of the planet, is beyond the power of man to compute; but the time will come when it will have recovered its ancient authority, and land will no longer be above the level of the sweeping, surging tides.

These continent-gnawing teeth of the elements may be likened to the Teeth of Time. They were busy at their work in the Tertiary periods, and have never paused for an hour nor a minute since then. In the Bad Lands of the Dakotas, those populous cemeteries of old-time life, are afforded most striking examples of erosive action. But it is to the great River Colorado of the southwest that we must turn if we wish to more fully comprehend the tremendous consequences of its persistent industry. The region drained by the Colorado, or more accurately speaking, that immediately tributary to the river, proper, is an old, old land. As we have seen, it had its beginnings in the far-off Silurian ages, since when most of it appears to have long existed unsubmerged, and with slowly expanding areas which kept on widening until the mountain upheavals completed the western aspects of the continent. Through this ancient land the Colorado has cut its prodigious gorges until it has severed all the strata of geological history and gone a thousand feet or more into the Archæan granite.

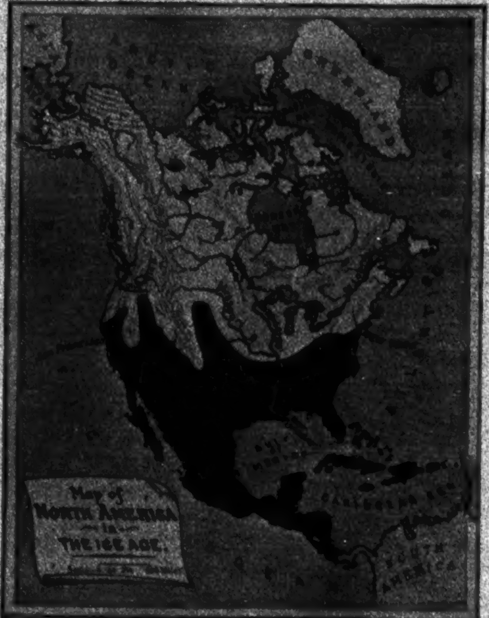
So slowly has this river's work been done that a man's life-span of three score years and ten, brings no evidence of subsidence that is perceptible to his view. Yet, this erosion has gone on so long that it has cut more than six thousand feet down into the great plateau it bisects—more than a mile. Its progress through the lower granites was, of course, far slower than in the softer strata that lies above. But suppose its average subsidence were of sufficient speed to enable a man to observe and record it. This he could readily do if it were as much as two feet within his life-time. But even this comparatively rapid progress would involve the lapse of near two hundred thousand years. Yes, these canon gashes are, indeed, the incisions of the Teeth of Time!

This Colorado plateau is nearly level, and is constituted of a mass of horizontal strata. The present surface formations are mostly of the later Carboniferous period and the Mesozoic Epoch. All the other vast masses once above them were long since taken away by the elements. Gigantic broad benches of terraces, rising step by step to the distant upper level of the region far in the horizon, have been formed in these strata we have mentioned, which are, moreover, occasionally interrupted by evidences of tremendous volcanic action. Far down in its canons the River Colorado winds its way through this forsaken land.

These gorges continue for a distance of nearly three hundred miles, and vary in depth from three thousand to upward of six thousand feet. In many places the rocky walls of these appalling chasms are sheerly vertical and an over-tossed stone will fall unobstructed to the surface of the sky-lighted stream in the depths below. The walls of the gorges show above the granite at the base, two or three thousand feet of Palæozoic sandstones, shales, and limestones; a thousand feet or so of sub-Carboniferous limestones; and twelve hundred feet of Carboniferous sandstone and limestone. Farther up the stream the chasms in their upper sections extend through Triassic and Cretaceous strata that have escaped the denudation which the elements have wrought on their extensions to the southward.

These circumstances show that the Colorado has done its mighty work in comparatively recent geological times, though they also point to a vast antiquity for it, if we attempt to measure the limitations by the standard of years. There was a time when this river flowed upon a surface endowed with fertile soil, watered by rivulets and minor streams which nourished a fair and luxuriant vegetation. Water may be considered as the life-blood of the earth. Through all these ages the Colorado has been sapping the very foundations of that dying region and, as Professor Winchell points out, is literally draining it to death.

The Mammals of the Quaternary Epoch were very numerous, and many were of great size. Some of them differed from those of both the preceding ages and the modern era. Their remains were preserved in ways different from those of the former Epochs, which sealed up the skeletons in the huge sheets of rock. These are found entombed in caves where the drippings from the roof have encrusted them with stalagmitic deposits; in bogs and marshes where the creatures sought food, were mired and died; in river deposits where their floating carcasses were stranded, and their bones buried under conditions favorable to preservation; in the bottoms of lakes covered by the ooze and sealed from destructive contact with the atmosphere; and frozen in cliffs and soils that have not thawed since the creatures were imprisoned there.



Their remains have been thus found in all the grand divisions of the northern hemisphere except Africa. North America was their prolific home and this region of western United States has given up numbers of their perfect skeletons. Of them the most remarkable are the herbivorous beasts. The great hairy Mammoth, an exaggerated type of Elephant, flourished here, but less abundantly than in Asia and Europe. In the latter he was contemporary with man as proved by a good profile of him engraved or cut on a flat bone found in a cave in France. In Siberia in recent years a carcass, frozen in a cliff, was discovered in such condition that dogs with the discoverers fed upon the flesh, the skeleton and hide being preserved and taken to Europe, where they served to restore his perfect appearance which is now before visitors to the museum at St. Petersburg. In March, 1899, circumstantial reports were sent from Alaska of the discovery by gold miners in the Klondyke region, of the perfect carcass of a Mammoth (or a Mastodon) in a frozen bed of gravel, forty feet below the surface. The Mammoth was twice as heavy and one-fourth higher than our largest known elephant, covered with coarse hair, had great upward curving tusks, which are still found in Asia in numbers sufficient to make them articles of commerce. Our State Historical Society has the tusks and some of the teeth and bones of one of these animals, which were exhumed near Castle Rock, in Douglass County.

The huge Mastodon, another elephant-like monster, and the largest known land mammal, found an agreeable home in the United States, over a large portion of which he flourished in great numbers. He enjoyed life on these western plains and was certainly a contemporary of human beings who then occupied the country, as will be shown in the next succeeding chapter. He was a monster, thirteen feet high, and including the projection of his tusks, twenty-five feet long. He was an Elephant, with but the minor difference of the character of his teeth; and a descendant of the huge Dinotherium of the preceding Epoch. Like the bison of modern times, the Mastodon found comparative safety from the attacks of enemies in his huge size and great numbers, for he was not a warlike beast. In large droves he roamed at will all over the central and northern regions of this land. When the foundation excavations were made for the McClintock building at Sixteenth and Larimer streets, in this city, a tooth of a very large Mastodon was exhumed; and similar relics have been discovered in many other places on the plains and along the base of the mountains.

There were two species of gigantic Bisons, the ancestors of our modern, misnamed, and recently plentiful animal of the plains. The larger of these old-time Bisons was equipped with horns measuring about ten feet between their extended tips, and twenty inches around the base. Horses had become of great size, from one-third to one-half larger than any we have now, and they roamed over the country in droves; but our Indian population had no traditions of them.

A magnificent Stag was so large that when standing, his horns reached to twice the height of a full-grown man; and he was in all respects an equal of the ancient Stag of Ireland.

The ferocious Cave Bear of Europe had his counterpart in this country; the Grizzly Bear of the Rocky Mountains being a direct and, with the exception of size, but little changed descendant.

The Beaver got to be five feet long, and there were large Tapirs, Peccaries, and Wolves. The Deer family had some representatives other than the great Stag, but generally speaking it belongs to our own period. Many of the ancestors of the smaller animals of the present time had entered upon their careers and existed in great numbers. All these improved forms of animal life were exceedingly abundant in those times.

In this Epoch there is believed to have been a second land connection with South America, across what is now the Caribbean Sea. That country had its own array of great creatures and three types of them are supposed to have migrated across this old and shorter route, for the skeletons of the Megatherium, Mylodon and Megalonyx have been found in the United States. These were huge Sloths, larger and heavier and more powerful than the biggest "Buffalo."

It may be said that all these distinct species of Quaternary Mammals are extinct, but many of their general orders survive in the modified forms of our familiar animals. With the ending of this Epoch comes the ending of what we may call the geological history of the earth. Its termination marked the beginning of geological modern times with lands and seas and life-forms as we have them now.

As to the length of this Epoch nothing definite in the form of an estimate can be attempted. If Croll's theory of the cause of the Glacial phenomenon could be demonstrated as the correct one, it would be a simple matter for the astronomer-mathematicians to tell us all about it. Other theorists, reinforcing Croll, have reached conclusions in line with their beliefs that the Glacial period began two hundred and forty thousand years ago, lasted one hundred and sixty thousand years, and ended eighty thousand years since. This result is different from that of Croll's original theory which contemplated a glacial return every twenty-one thousand years, as it makes but one great interglacial era instead of the eight of somewhat varying intensity provided for by Croll's original views. But these speculations may be left to the geologists and the astronomers whose duty it is to deal with them and tell us the truth whenever they find out what it is.

The reign of brute force and animal ferocity came to an end and man entered upon his dominion over the earth and over all that was upon it. We might naturally have concluded that in a consistent, orderly sequence in all these strange developments, in later periods as well as in the earlier, that it would not be unreasonable to assume that primitive man had his first abiding place on the continent which included the primitive land of the world. But we are told that this was not so. He is supposed to have presented himself around on the other side of the earth, but further than to credit him to Asiatic regions, no one has undertaken to fix the locality of his appearance. Whence he came here, how he came, just when he came, no one knows. Whether it be true that his origin is associated with the Apes and their kindred creatures who swarmed into existance with him, who can dogmatically say? Whether he originated in Australasia or in Asia and spread over the earth, reaching America with the migrating animals from the other side by way of the northwest, who can tell? Whether he existed before the Quaternary Epoch, who can decide?

Of the length of time man has existed on the earth, Le Conte says:

> "There is no doubt that very great changes, both in physical geography and in the mammalian fauna, have taken place since man appeared. Judging by the rate of changes still in progress, we are naturally led to a conviction of a lapse of time very great in comparison with that recorded in history. * * *
>
> "In conclusion, we may say that we have as yet no certain knowledge of man's time on the earth. * * * It may be one hundred thousand years, or it may be only ten thousand years, but more probably the former than the latter."

Evidence of the remotest presence of man on this continent exists on the Pacific Coast, where his works are found associated with the remains of long-extinct animals. Evidence beyond this has been diligently searched for but never found; and his works are always more numerous and less perishable than his bones. Yet, there are those who expect to see him established as a hero of the middle period of the Tertiary Epoch, when only heroes could exist.

But the beginning of this era is of less importance than the fact that it had at last begun. Of this, Le Conte, whose exhaustive and most scholarly work on these deeply interesting subjects, has been of great service to us, and from which we have so frequently quoted, says:

> "In regard to the distinctness and importance of this era, there are two views which will probably ever divide geologists, depending on the two views regarding the relation of man to Nature. From the purely structural and animal point of view, man is very closely related to the animal kingdom. He has no department of his own, but belongs to the vertebrate department, along with quadrupeds, birds, reptiles and fishes. He has no class of his own, but belongs to the class Mammalia, along with quadrupeds. Neither has he an order of his own, but belongs to the order of Primates, along with monkeys, lemurs, etc. Even a family of his own, the Hominidoe, is grudgingly admitted by some. But from the physical point of view it is simply impossible to overestimate the space which separates man from all lower things. Man must be set off not only against the animal kingdom, but against the whole of Nature besides, as an equivalent; Nature the book—the revelation—and man the interpreter.
>
> "So in the history of the earth; from our point of view the era of man is not equivalent to an era, nor to an age, nor to a period, nor even to an epoch. But from another point of view it is the equivalent of the whole geological history of the earth besides. For the history of the earth finds its consummation, and its interpreter, and its significance, in man."

What kind of creature, whether he were primitive man, or not, the earliest human inhabitant of this geologically ancient continent could have been, what were his hopes and fears and ambitions, are questions that open to the imagination a field so wide that its limits may not be defined by any known authority.

In the cluttered wreckage left by the great winding-sheet of ice, and also in the more orderly deposits made by it, has been found the first definite evidence of man's presence on this hemisphere. He may have been here before this icy period; he probably was here during the latter part of its continuance and witnessed the prodigious alternations going forward in his ancient landscape; he certainly was here when the ice-movement ceased, and the mighty, frozen mantle melted away.

Buried in the Glacial drift and deposits have been found his few rude implements of stone, roughly fashioned, which were at once his dependence in the chase, and his means of salvation in combat with hostile neighbors of his kind. He clothed himself in the skins of beasts, and probably was the fiercest of all the creatures which once roamed over this land seeking something or somebody to devour.

What became of this interesting pioneer, how he was overwhelmed or removed, will never be known. Whether he was swept away by some catastrophe, or conquered and submerged by a later and higher race, no one knows. Like his contemporary of southern Europe, he disappeared, leaving us only a few of his rude relics to suggest the outlines of his hard life amid appalling surroundings.

So, the feeble light of this early and savage creature went out; and the brief tale his pitiable belongings tell us, ends abruptly in a long period of the deepest gloom, unrelieved by any ray of light. He and his fate are shut in behind a wall of darkness and forever buried there. Through an unbroken silence; a long night of solitude; an unknown length of years, obscurity rested upon the story of man's existence on this great continent.

CHAPTER III.

Pre-Historic Man—Strange Race of Mound-Builders—Extent of Their Empire—Colorado Its Southwestern Borderland—Character of Their Monuments and Relics—Theories Attempting to Account for This Vanished People.

Of the vast antiquity of the human race here in North America there is little to question; but when we undertake to assign its limits or designate its periods we are confronted by circumstances that baffle the understanding. What is to be said of a human skeleton found embedded in a Florida coral reef which Agassiz declared could not have been less than ten thousand years old! Or of one found near New Orleans buried under four distinct, and successively prostrated forest growths, separated by layers of sedimentary deposits, which Dr. Dowler estimated to have involved the lapse of fifty thousand years? Or of the still more amazing antiquity suggested by the situation of a human skull buried under Table Mountain, California, in the presumed deposits of the pliocene or post-pliocene period? Great masses of lava and other volcanic matter lay far above the grave of this ancient man, who, if the resting place of his remains were correctly designated by those believed competent to do so, may have lived in years, three or four times more remote than those of the man whose bones were exhumed by Dr. Dowler from the delta of the Mississippi. In Kansas the bones of man have been found buried in a marsh with those of the long-extinct mastodon, under circumstances indicating that the two had perished together. In Iowa a few years since a pipe carved in excellent imitation of the same ancient beast was found, the object proving its maker to have been not only familiar with the mastodon, but of a race old enough to have acquired the comforting habit of smoking.

Professor George Rawlinson (Professor of Ancient History at the University of Oxford, England), who rejected the doctrine of the evolution of man as it is popularly presented, opens the first chapter of his "Origin of Nations" (1877), with the following:

> "It is commonly assumed at the present day that civilization is a plant of slow and gradual growth, which developed itself by degrees in the course of ages, and which belongs consequently to a comparatively late period of the world's history. The 'primeval savage' is a familiar idea; and the so-called science of the day is never tired of presenting before us the primitive race of man as only a little removed from the brutes, devoid of knowledge, devoid of art, devoid of language, a creature in few respects elevated above, and in many sunk below, the anthropoid apes, from which it is held that he derived his descent by way of evolution. Occasionally, indeed, a confession is made—parenthetically and by the way—that there is no proof of this supposed priority of savagery to any form of civilization; and it is admitted to be questionable which of the two preceded the other. But this confession hurriedly uttered and hastily slurred over in most cases, makes little impression on the public mind, and the belief is general that in some way or other science has proved that the first men who inhabited the earth were savages, and that there was no civilization till a comparatively recent period."

Sir Charles Lyall, a distinguished English scientist who accepted the general theories of evolution, and who extended his personal researches to this country, says, in his "Antiquity of Man," that "we have no distinct geological evidence that the appearance of what are called the inferior races of mankind has always preceded in chronological order that of the higher races."

These eminent writers, representing opposing views of a great problem—with the latter standing for the almost unanimous scientific belief—practically agree upon one of the questions involved.

Here in this country a race of people once existed whose monuments and relics are impressive evidence that they were far above the kind of man who, so far as there is anything to show, next preceded or next followed them on this continent. That man was here in or near the glacial times can not with reason be doubted. The few forms of simple, roughly-shaped stone weapons—exceedingly crude things, all of them—found in the glacial gravel-beds, and similar ones in the glacial rubbish on or near the surface, fairly indicate that man of glacial times was a rude, fierce, savage creature whose unattractive life was a struggle for existence under exceedingly harsh and perilous conditions. His surroundings would have made and kept him such a being were he not already so. The situations in which his miserable relics have been found somewhat definitely associate him with the ice period, which came so long ago, in an era so remote, as we have stated in the preceding chapter, that little may be said of its limits. Professor G. Frederick Wright, in his scholarly work, "The Ice Age in North America," guardedly attributes an antiquity to this man of the glaciers of from eight thousand to ten thousand years. Other capable students of the question assert that it was ten times more remote.

He left little material for his historian. His few trumpery weapons, identical in their crudity, exhibiting little mechanical knowledge and no improvement of one over another, constitute the whole of it. They seem to tell us that his numbers were not large and his worldly experience not prolonged. After this dull glow in the distant gloom, darkness sets in again, and we lose all trace of our ancient friend. Whoever may have followed him in that period of night-time in human history—if there were such an interval—were less considerate than he, for they left nothing behind them to tell us of their sojourn.

However many the years that may have intervened—and who can tell how many, or how long the period lasted?—the curtain finally rolled back, and there was revealed, as we have said, the dawn of a comparative civilization from a new people who flocked in and occupied the land. Whether as conquering invaders driving older inhabitants before them and taking the country by the prowess of their legions, or as peace-seeking colonists who found nothing more formidable than the wild animals of the region to dispute possession, is not known; nor is there any way of learning. All we know is that an apparently intelligent race of people appeared in great numbers, well advanced in knowledge, with evident capacity for taking care of themselves and dominating a great empire. Denver stands in the southwestern borderland of the vast region they once occupied, and their monuments and relics almost compel us to regard them as having been a distinct, a nearly unique type of humanity.

They were the strange nation of "Mound Builders," of whom so much and yet so little is known; and whose history, or the lack of it, is a most fascinating mystery in the annals of the human race. Some of their modern commentators have attributed to them an era somewhere near four thousand five hundred years ago; but there is no authority much better than the common privilege of guessing, for even this approximation. They came, they saw, and if they did not conquer, it was probably unnecessary to do so, and not because of lack of numbers or intelligence.

Who and what they were, whence they came, how long they stayed, are questions to which instead of definite answers only vague surmises can be offered—so vague that silence might seem preferable. They lived and multiplied and flourished, and spread over the country until their dominion embraced all the vast territory drained by the Mississippi and its tributaries, stretching from the Alleghany ranges on the east to the Rocky Mountains on the west; and from the northern boundary of the United States to the Gulf of Mexico.

They were also in Florida and other localities in the southeast, and occupied the western end of the State of New York. By way of the upper Missouri they extended their possessions until they included a large section of the country along the Columbia river. The name by which they are known to us was derived from the character of many of their works, though their mounds are only a part of the various structures of earth and stone they left behind them in extraordinary numbers everywhere they went.

They disappeared as if the earth had opened and swallowed them in its depths.

A circle three hundred miles of radius, embracing the mouths of the Missouri and Ohio rivers, and with the city of St. Louis as its focus, would define a region that appears to have been the general center of their population, though not of their territory. It was densely populated by them. The familiar appellation "Mound City," applied to St. Louis, was derived from the great number of mounds formerly existing on the site of that city.

From that center their people were distributed over the broad empire that passed under their control. Above St. Louis on the east side of the river stands one of their most ambitious works; the great mound of Cahokia, which may be taken as a type of its class. This huge elevation is a pyramid ninety-seven feet high, two of its sides seven hundred feet long at the base, and the other two, five hundred feet long. It stands with the cardinal points of the compass, and on the south side was a terrace one hundred and sixty feet by three hundred feet, reached by a graded approach. The top of the mound is truncated, making a level surface two hundred feet by four hundred and fifty feet. On this, stood a small conical mound ten feet high in which many human bones were buried. On the Missouri river was another ambitious work, but of a different character. This was a great enclosure surrounding six hundred acres of land. Some very large mounds and many small ones are found in the two Dakotas, where there seems to have been another broad area thickly populated. On the headwaters of the Missouri and Yellowstone rivers was another exceedingly populous district; and the land of Nebraska and Kansas is also strewn with their works and relics.

Whatever else the Mound Builders may have been, they were beyond all question a race of tireless workers. If they did not serve the Lord, they surely were diligent in the business of their lives, Nowhere in the world has an unknown, an utterly forgotten people, left behind them so much enduring work of their hands as these old-time folks builded.

Thousands of their curious earth-works are distributed over the country, bearing silent but impressive testimony to the presence in a far-off time of a great, industrious and intelligent population. When it is considered that these vast and abundant works were probably the result of patient toil by human muscle alone, they seem to indicate in their builders something of the diligence, methods and purposes associated with the pyramid-and-temple-building races of ancient Egypt, with whom, its is thought by some antiquarians, these people may have had common descent from a more remotely ancient race.

However, much uncertainty exists as to the purpose for which these structures were made. Many of them appear to have been military fortifications, and would still do very well in that capacity in modern warfare. These usually occupy commanding positions on elevations well chosen for defensive purposes. Considered as fortifications, they were intelligently located and shrewdly planned in all their details, and the conclusion that they were intended as permanent garrison points for large forces of men, is not easily avoided. Some of the more pretentious undertakings of this character were surrounded by ditches, and had artificial lakes or reservoirs in the center with capacity for supplying a large army with water for many months; arrangements which indicate intelligent military perceptions. Of the mounds, many were burial places and probably intended as monuments to chieftains above whose bodies they were reared. Some of these mounds, the loftier ones, may have been used for signaling purposes by fires on their summits—the scriptural column of smoke by day, and the pillar of fire by night. The earth at the tops of this class of mounds still shows the effect of fire, and has mingled in it ashes and charcoal. The effect of fire is also present in the mounds known to be places of sepulture, suggesting the sacrifices and burnt offerings of ancient peoples in other parts of the world.

Indications are not lacking that wives and attendants were cruelly compelled to accompany the departed lord of the household to comfort and wait upon him in the unknown land to which he had gone. The presence of charred human bones, and personal ornaments, in fire-marked strata above that in which the unburned bones and belongings of a buried individual are found in the same mound, points plainly to such a custom. In other mounds, containing no evidence of being places of sepulture, such charred bones are found in the burnt clay, in company with various personal adornments. These were probably places of human sacrifices. That these people believed in a state of future existence is shown by their practice of burying with their dead an outfit of weapons and implements, cooking and other utensils, likely to come handy in the great Hereafter.

The Mound Builders probably were a warlike people, but further than this they must have been from necessity, industrious tillers of the soil—a busy race of farmers in times of peace, at least. So large a population as they numbered could not have existed by the precarious methods of the red man of historic times, whose hunting grounds here on earth were his chief dependence, and whose ideas of heaven centered in fairer lands where game would be abundant and easily brought to pot. For the sparse Indian population anywhere, agriculture afforded only a secondary food supply, wholly dependent on the inclination of the squaw to work; and here on the plains little or nothing was planted or cultivated. But for the swarming multitudes of the other people, tilling the soil must have been the main chance. Traces of artificial irrigation—remains of what appear to have been dams and canals—belonging to the same age and race, have been found, indicating the agricultural character of the numerous, energetic, busy population.

They were good mechanics and their hardened copper tools such as axes, adzes, chisels and drills, found in the mounds were fashioned very like those of the present time. Slender tubes of stone a foot or more in length, made by drilling, are as accurate as the bore of a rifle and so round and straight in their outlines as to indicate knowledge of the lathe. They understood the principle of the rifle and gave to the form of their flint arrowheads the "twist" that the spirally grooved barrel of the modern weapon imparts to the motion of the bullet. In addition to shaping in stone fine examples of tools, weapons, ornaments and objects probably of a religious or symbolic character, they were ingenious workers in metals, and wrought from copper, lead and silver, many creditable implements, utensils and ornamental things. They appear to have valued silver highly, and would hammer it out into thin sheets with which they covered copper or stone ornaments so deftly as to almost escape detection of the joining lines. In their sculpture they creditably reproduced the human features, and their pottery was gracefully modeled, and shows much artistic skill in its embellishments. The marks of saw teeth are seen on some apparently unfinished ornaments, and as their porphyry carvings will turn the edges of our ordinary steel knives, they must have had tools of some highly tempered metal. They were great smokers, and pipes of many designs—the heads of men, forms of birds and animals—finely carved and finished, are found in great numbers, some being amusing caricatures.

Map of part of the Mississippi Valley, showing, as indicated by dots, the location of more conspicuous works of the Mound Builders within the mapped area.

They had acquired control of iron ores and possessed weapons made of that metal. They also understood the art of weaving, as shuttles and fragments of cloth have been found among their relics. All along kindred lines they seem to have been well advanced. That they possessed a system of weights is shown by a pair of bracelets found on the arms of a skeleton in one of their mounds; they were duplicates in size and each weighed precisely four ounces. Their sculptures and carvings show much progress and considerable art, and their ingenuity produced many curious musical instruments. They adorned their persons with necklaces of copper or silver beads, or of shells; and made bracelets and finger-rings of silver or copper. In other fashions of arraying themselves they appear to have had many of the enlightened vanities and weaknesses of our own times.

That the Mound Builders were a progressive race is shown by their acquisition of metals and their skill in working them. They were passing away from the age of stone. Whether, considering them as invaders, they brought their productive and artistic knowledge with them, is, of course, a question.

They had long been far out of the mental darkness that surrounded savage man. Their elaborate earth-works prove them to have been good civil engineers and to have had a definite system of measurements. In addition to raising great mounds in the forms of both cones and pyramids, they erected circles, squares, octagons, angles and large enclosures which were accurate in all their lines. These were built up of earth, from ten to fifteen feet high, like a railway embankment, and in such work the modern engineer can do but little better. Some of the large enclosures were adapted to great civic and religious festivities and may have been used for such purposes. In Wisconsin they reared huge earthen effigies of men, and of birds and animals, one of the latter being a reproduction of the form of an elephant. This shows that they were either contemporaries of the great mastodon which one flourished in large numbers over the wide valley of the Mississippi, or that they had definite knowledge of him or his descendants. The figure of a big serpent, seven hundred feet long, with a nearly round object in its open mouth, still existing in the Ohio river valley, hints at knowledge of Eve's unfortunate transactions long ago.

In Wyoming the relics of these people are plentiful and survive in fair preservation. Among them have been found shafts and other excavated evidences of mining operations, or attempts at them.

As we have heretofore said, Denver stands in the southwestern border-land of the great domain once occupied by this strange race. The plains of Colorado seem to have been part of their west-southwest frontier, and have revealed, up to this time, only a few somewhat obscure traces of the ancient presence of these people upon limited sections of them, and none in the near vicinity of Denver.

In a communication on this subject to the editor of this work, Mr. J. W. Powell, Director of the American Bureau of Ethnology of the Smithsonian Institution at Washington, said:

"The ancients of Colorado, so far as indications show, belonged to the western, or in the broad sense, to the Pacific slope races; including in this expression the entire mountain and intermontane areas. If it were desirable to speculate from the few and insignificant evidences obtained, we would be disposed to believe that Colorado, except along her southern and southwestern borders, has played a less important role in prehistoric times than the areas immediately south and west. The remains in her south and southwest areas must be classed with those of the so-called Pueblo region. Aside from these there have been but few monuments discovered of which notice has appeared, and these of uncertain character as to classification, and of relatively minor importance. Possibly careful exploration might bring to light farther and more important monuments. Our conclusions are based on what have been discovered."

There is nothing known that indicates any connection between the true Indian people of our historic period who occupied the same territory, and this teeming race of toilers. Leconte, one of the most eminent authorities, says they "were probably a different race from the hunter tribes of Indians." The two appear to have had nothing in common; but to have been wide apart in all their habits, methods and customs. The Indian was thoroughly a savage, and nothing else; while these people were certainly far above that condition. The builder of the mounds must have been incessantly at work at his farming, fighting and building; the Indian abhorred work in all its forms and would have none of it. The one made many large and enduring constructions; the Indian never built anything. The ancient people were skillful engineers; the Indian had no such knowledge, nor had he any use for it. The first were good mechanics and artisans; to have been either the Indian would have had to labor, and that settled it so far as he was concerned. The Mound Builders were permanent occupants of localities; the Indian was a rover and any place he happened to be in the region he claimed, was as much a home as he cared to have. The extraordinary character of the Mound Builders' works and the remarkable relics they contain render it almost certain that these people bore no relation to the races inhabiting the country when Columbus discovered America.

Their structures, unlike those usually found as reminders of extinct semi-civilized tribes, are not confined to any single, particular purpose, but their great variety of form points to an equal variety of purpose. Who these builders were and what were the uses of their structures will probably remain forever undetermined.

The Indians of our times had no traditions nor legends that could in any way be associated with a knowledge of this mysterious people. They had observed and noticed the many structures of strange form, and clearly the work of human hands; they had gathered, utilized, and by the hard and patient labor of their squaws, imitated the stone weapons and implements to be found on the surface of the ground; but they had neither knowledge nor tradition of the people who made the objects which attracted their attention, and those which they found adapted to their daily necessities of the chase and their frequent needs in warfare. The earthworks and other evidences of human agency aroused their stoical wonder, while the tools and weapons were of the utmost usefulness to them in their daily business. This absence of all tradition, all knowledge of a preceding race, while possessing legends of so remote an event as the scriptural deluge, has been generally accepted as an important part of the evidence that the Indians probably followed long after the Mound Builders had gone the way ordained for them by fate, leaving behind a multitude of enduring monuments to their numerous and protracted existence in a vast empire of territory.

It is, of course, more than likely that such a people dwelt in permanent habitations, but no evidence of it is known to exist. If they used separate dwellings, or if they lived in community houses like those of the Cliff Dwellers, they made them of materials that long since disappeared. Their occupation of latitudes where winter cold is extreme would lead so intelligent a people to provide substantial and comfortable domiciles for themselves, unless they were here in that distant period in the past when a semi-tropical climate is believed to have prevailed over what is now the United States. None of their surviving structures were habitations, and all of them are built of earth, or stone, or of both—the most durable materials man has found for his edifices.

A remote antiquity is to be attributed to this strange race, and it is probable that their sojourn covered many centuries. Finding in their mounds charred remains of full-sized grains of "Indian corn" is one evidence of this. The plant is indigenous to North America, yet these people had cultivated and used it for so long a period that it had become as we know it now. Its wild original of probably dwarfish growth was unknown to the Indian of historic times. He knew it only in its present highly developed form and had no tradition of the source from which he obtained it. The earthworks raised by these people are not found on the lowest of the river terraces which mark the slow subsidence of the streams, and as there is no good reason why their builders should have avoided erecting them on that terrace, while they raised them promiscuously on all the others, it not unreasonably follows that this terrace has been formed since the works were built, and that great rivers have become small streams since this lost race vanished.

There are reasons for believing that, in the later period of their occupation, at least, they were constantly menaced by powerful neighbors, and that they had a continuous struggle for self-preservation. That they feared grave danger from the east is shown by the great numbers of elaborate and evidently defensive works they maintained along their eastern border where it neared the Alleghanies. It is suggested by some theorists that the Cliff Dwellers were a far later people, and that their tenantless homes in the southwest were outer fortresses erected by the Mound Builders to guard against danger coming from that quarter; that the latter were forced to abandon them and leave them to be utilized as dwellings by the later people with whom we associate them. But this theory is far-fetched and decidedly untenable.

If the Mound Builders were overwhelmed by other people, an event of which there is not the faintest evidence or indication, which side survived the contest and possessed the country for themselves and their descendants? There is nothing to show that the Mound Builders were either victors or vanquished, nor did any tribes of modern times preserve the slightest traditional knowledge, or other trace, of descent from them.

All attempts to establish a lineal connection between them and the Indians of the Mississippi valley who were occupying the country at the time of its discovery by Europeans, have encountered obstacles that have not been overcome. The Indians were so far below the older people in habits, mechanical skill, and other manifestations of applied intelligence, that no theory of subsequent racial degradation can be made to fit the extraordinary circumstances of the case. It is in no sense probable that a people of direct or indirect descent, even though it led through many centuries, would have utterly lost all knowledge and methods of their ancestors, and would have been so completely destitute of every evidence of kinship as the Indians were of this old-time race.

That a unified, organized, comparatively civilized nation of people should vanish like a light snuffed out, leaving not a vestige of written or symbolic record of their times and achievements, so far as known, is one of the profound mysteries associated with the history of mankind. The man of the glacial period left nothing of the sort, but he should not be reproached for failing to have done better than he did. These people, however, were advanced in knowledge, and measuring them by their works, they were numerous, orderly, intelligent and skillful.

It has been assumed, though without any conclusive evidence, and mainly because it is about the best that can be done, that this race was next in succession to the half-human, half-animal man who left buried in the drift of the glaciers nothing but his crude weapons of stone to tell us he had been here. Was our glacial friend overpowered and exterminated by the strange strangers who swarmed over the country? Or was there a long interval of years between the going of the one and the coming of the others? These are problems alike shrouded in the mists of a hoary antiquity.

CHAPTER IV.

THE CLIFF-DWELLERS—LOCALITY, AREA AND CONDITION OF THE REGION THEY OCCUPIED—MAGNITUDE AND EXTENT OF RUINS—VARIETY AND CHARACTER OF HANDIWORK—PROBABLE GREAT ANTIQUITY—THEORIES OF ORIGIN AND FATE.

Turning to the southwest we encounter the ruined monuments of another strange people, whose manners, practices, and modes of life appear to have been radically different from those of the ancient race we have been considering, but who long since vanished from the stage of human action, leaving behind them much that tells us of their presence there in the past, but little that enlightens us in what we would most like to learn.

There is just one place in the United States where a man—or a woman, either—may set foot on a spot and be standing on soil belonging to four of the great political sub-divisions of the Nation; the four being Colorado, Utah, New Mexico and Arizona. There, the right-angled corners of those two States and two Territories meet in a land strewn with ruined antiquities, the relics of one of the more singular races, or varieties, of humanity of which we have any knowledge.

The region once inhabited by these extinct people embraces a large portion of New Mexico and Arizona; the southeastern part, nearly one-third, of Utah; and the southwestern portion of Colorado; in all, about six thousand square miles. The existing Pueblo Indians occupy but small areas of the great wreck-strewn field, that is literally filled with the crumbling monuments and broken rubbish of a long departed people.

The number and extent of these relics, scattered over so large an area of country, most of which is now arid and desert, show that at some time in the past, the region was capable of supporting a large population of some approach to civilization. Certain portions of it appear to have been densely populated. Whether these people were peculiarly adapted to such a country as it now is, and could support themselves upon its soil under existing circumstances, or whether great climatic changes have occurred since the period of their occupation, reducing the region to its present comparatively unproductive condition, are questions no one has been able to satisfactorily answer.

It seems more probable, however, that these wrecked habitations do not represent an era so remote that time enough has intervened to bring radical changes of climate. In their time the territory may not have been quite so desolate as it is now, for five hundred or a thousand years may have wrought some changes in it, though such processes are of long duration. There is nothing to indicate that the climate of Europe has materially altered in ten centuries, and there is certainly no perceptible modification of that of the United States, generally, since the discoverers landed on its shores.

This belittered territory in the southwest was evidently inhabited by a peculiar people, from a great antiquity. They appear to have dwelt, in the earlier periods, out in the open, on what are now the sandy plains and parched mesas, where large districts are thickly encumbered with the remains of their handiwork. Later they, or those who survived the cause of their change of habitation, took to the cliffs in the river canons, where, judging from the magnitude, numbers and condition of their domiciles, they must have maintained themselves through many generations. There are, however, some theories to the effect that the ruins out in the open represent the work of another, later, and quite different people. But the preponderance of opinion is that the ancient, time-worn, foot-worn homes of men in the cliffs, were built and resorted to after circumstances had made untenable their previous dwelling places in the valleys and on the mesas, themselves of great size and with every indication of profound age present in what remains of them. All the conditions point plainly to human occupation of that region from remotely by-gone times by people not savages as were our Indians.

We will not go further into consideration of the relics of these strange beings, than to give some account of those of the Cliff Dwellers, found in such profusion in the southwestern part of Colorado, in the canons of the Rio De Los Mancos—the "River of the Cripples" to the Spanish-speaking people, and a tributary of the San Juan. If this stream did not receive its name from the many badly crippled buildings of the Cliff Dwellers, past which it flows, it might well have done so. In this Mancos country the most remarkable, the grandest, and most picturesque ruins of these structures yet discovered, are situated.

Ruins on the Mesa.

Across to the north and east of this district are mountain chains as beautiful as any in the world. The Mancos valley or canon is a deep, river-worn gorge through the great Mesa Verde, having lateral canons branching out from either side. At the northern opening of this gorge it spreads to a width of about five miles; at its southern end where it expands into the San Juan valley, its width is about three miles; intermediately the gorge narrows in several places to a width of less than a half-mile. Through this gulf the River Mancos, once a vastly larger stream, now a slender ribbon of water, winds its way down to the River San Juan. In portions of the year the lateral canons all have streams flowing through them; at other seasons their beds, are dry and water may not be found within long distances. Approximately, the district of the Mancos canons is, throwing it into a rectangular form lying from northeast to southwest, ten or twelve miles in width by thirty miles in length. The Mesa Verde, thus cut and seamed by these gorges, is a plateau rising from fifteen hundred to two thousand feet above the surrounding valleys, embracing upwards of six hundred square miles. It is covered with a thick growth of pinon, juniper and cedar, and with coarse grasses, struggling for existence. It was so named by Dr. J. S. Newberry, of the Macomb exploring party of 1859; and at that time grass was growing on many of its precipitously sloping sides. A large portion of it lies within what was recently the Ute Indian reservation, a long east and west strip fitting into the extreme southwest corner of Colorado.

On the mesa and in the wider portions of the adjacent valleys are found the ruins which were certainly the earlier habitations and structures made and used by these people; in recesses in the faces of the canons' walls are the cliff dwellings, proper, many of great size, that bear testimony to a later construction and occupation by the same industrious race of builders. The remains of the apparently older buildings indicate that the edifices were much larger than those in the cliffs, and that some were capable of housing a couple of thousand people each; one being thought to have contained more than five hundred rooms.

The lingering note of this land of canon and mesa harmonizes with our conceptions of what the landscape of a dying world might be. Rent and seamed and scarred in battle with the elements through long ages, exhausted by the weary struggle, its strife-worn aspects leave in the beholder's thoughts something of their tones of sadness.

It is but fifty years ago that this region of ruins was first visited by Americans. In "Notes of a Military Reconnaissance" in 1846-47-48, by Lieutenant J. H. Simpson of the United States army, an account is given of the discovery of deserted ruins in that country. In 1859 a United States geological surveying party under Captain J. N. Macomb made some explorations on the Mesa Verde and in the canons of the Mancos. Some of the wreckage of the district was carefully observed, sketched, and noted, but as the party's visit was for geological research, not so much attention was given the other as should have been. The published documents consisted chiefly of the report of Dr. J. S. Newberry, containing only passing allusions to the ruins which, therefore, did not become generally known. Later, a prospector named Osborne visited the district, but did not go far into the canons. He discovered the structure known as the "Brownstone Front." The United States surveys under Hayden in 1874-76, gave the region merited attention. The district was in the territory assigned to Mr. William H. Holman, and as a consequence the Hayden Reports contained accounts of these antiquities commensurate with their magnitude and archæological importance. Since then the public has been advised of their extent, character and interest by the Bureau of Ethnology of the Smithsonian Institution and by many writers whose observations, and more or less conflicting conclusions, have appeared in books, magazines and newspapers; so that we have now an interesting literature on the subject, of considerable volume. In one of his reports Mr. Holmes said:

> "In a number of ways the valley of the Rio San Juan possesses unusual interest to the antiquarian. Until within the latter half of the nineteenth century it remained wholly unknown. The early Spanish expeditions are not known to have penetrated its secluded precincts, and its cliff-houses, its ruined pueblos, and curious towers have been so long deserted that it is doubtful whether even a tradition of their occupation has been preserved, either by the nomadic tribes of the district, or by the modern pueblos of the south. Certain it is that no foreign hand has influenced the art of this district, and no Spanish adventurer has left trace of his presence."

The magnitude and numbers of these surviving but dilapidated structures are astounding. Some of them look like great feudal castle-fortresses, with their massive walls, lofty towers and keeps, capable of accommodating a small army as a garrison which might withstand the assaults of ten times as many besiegers for years.

Of the remains of the presumably older buildings, all of which are far nearer complete destruction than those lodged in the cliffs of the canons, some impressive examples are found in the Montezuma valley, immediately northwest of the Mancos. These were visited by Mr. Holmes, and in an account of them, published by the Bureau of Ethnology in 1878, he gave the dimensions of two. One is one hundred feet long, eighty feet wide, and the walls in their ruined condition stood about fifteen feet high at that time. The larger one of this group is two hundred feet long and one hundred and eighty feet wide. The stone used in their construction is a fossiliferous limestone, brought from an outcropping at the base of the Mesa Verde, a mile away. As these people had no means of transportation save that to which human muscle could be applied, moving their building material was a prodigious task, for Mr. Holmes estimated this assemblage of structures to have contained one million, five hundred thousand cubic feet of masonry.

One of the largest and in many respects the most remarkable of all the structures still standing in the cliffs, though much broken, is the "Cliff Palace," so named by Richard Wetherill, its discoverer. It is in one of the branch canons, and stands in a huge cavern, the roof of which is a great natural arch. This building occupies a space four hundred and twenty-five feet long, one hundred and eight feet deep, and eighty feet high in the central front. On the ground floor alone one hundred and twenty-four different apartments have been identified; and the ruins indicate that the building originally contained several stories. The structure appears to have been a growth by successive additions. Back of it in the cavern are small buildings standing on ledges and in crannies. This wonderful structure with its dismantled towers, ramparts and bastions, and its great walls, appears like the palace-fortress of the ruler of a powerful nation. When the morning sun shines into the vast cavern, illuminating its recesses, and bringing out the lines of the great ruined building and its accessories, the effect is indescribably fine when seen from the top of the opposite cliff, a thousand feet or more across the canon. The picture is marvelous!

This structure, which may be reached by steps in the cliff, was a great community-house and the home of many hundred people. The rooms were of various shapes and sizes, those in one of the round towers being upward of sixteen feet in diameter, and several have fire-places. In them have been found a number of skulls and other human bones, some perfect pieces and much broken pottery, weapons, fragments of cloth, and other belongings of their former tenants. Some of these circular rooms in the buildings have stone benches around next the wall, and a fire-pit in the center of the floor.

In another branch canon, the Navajo, the remains of over a hundred large buildings, containing thirty rooms, and more, are found. Some are mere heaps of rubbish; others in fair preservation. Of the latter, one is three hundred feet long and parts of it are standing three stories in height. Its surroundings show that originally it was a terraced building five stories high, the lower two benches standing outside the arch of the cavern and lower than its floor. From the wall in one portion of the structure, beams project outward and apparently once bore the floor of a balcony. We may imagine the young cliff-lady sitting there in the pleasant evenings listening to the strains of music brought forth from a flute by the young cliff-swain below. They had flutes; one in good condition having been found among their relics.

The circumstance of an old spruce tree, eighty feet high and three and a quarter feet in diameter twenty inches above the ground, which grew from the hillside portion of these ruins, gave them the name of "Spruce Tree House." This tree fell a few years ago, but the building had crumbled under the weight of its years, and the thin soil was accumulated among the debris by the scurrying winds, before the seed of that old tree fell there, sprouted, took root and began to grow—and how long did it take for all that to be done?

At a remote place in this canon, far from the river, is a great arch sheltering the ruins of a still more extensive structure, standing on a ledge nearly five hundred feet long, the arch rising in the center about one hundred feet above the natural platform. This great space was filled by the building, of which one end is standing three stories high. As this end is crowded in under the lower part of the arch, the central front of the structure was probably five or six stories high. Below and in front of the ledge are the tumbled-down walls, overgrown by trees and bushes, of the lower terraces of the structure which were built outside the shelter of the arch. In its complete form this mighty fortress must have been almost impregnable. Its standing walls in many places are still firm, and the general appearance of the building indicates that it was all of simultaneous construction, and capable of sheltering a small army; but there is now no water anywhere near it. As with most of the other large cliff-houses, this one has small structures stuck in around it in the farther and lower recesses of the cavern, and upon the ledges above. One of these, a small box of a thing, is perched where it commands a fine view of the canon, and has a number of loop-holes through the walls, at the level of the eye. It certainly was a watch-tower from which to observe the approach of danger. This great ruin, the largest in the region, has been called the "Crenellated Fortress," but Chapin, acting upon the suggestion of the peculiar little tower, calls it the "Loop-Hole Fortress."

"Cliff Palace." (Photographed by Charles R. Borst.)

It does not seem probable that these Cliff Dwellers flourished in a period remote enough to have made them contemporaries of the Mississippi Valley Mound Builders, though their origin, progress, place in the chronology of history, and their fate are surrounded by too much obscurity to be disposed of dogmatically. Those who ascribe to them a remote period in the past, base their beliefs on the lithic character of their weapons and tools, and point to their ignorance of the use of metals, though occupying a region abounding in them, as evidence of their great antiquity in the career of the human race. The Mound Builders, and the ancient peoples of Mexico and Peru were skilled metal-workers, but these Cliff-Dwellers appear to have been wholly unacquainted with the production or utility of any of the metals. No metallic object or utensil of their times has yet been found in or near their abandoned habitations. Had they, it is said, been contemporaries or successors to the other peoples, it would seem probable that they would have either developed some such knowledge, or would have acquired it from their southern neighbors, for it is unlikely that there would have been no communication between them and the ancient Mexicans, had the two flourished in the same period.

The Navajo Indians of the present time, and dwelling in that general region, are metal-workers of much skill, and have been for many generations. They deny having acquired their knowledge from the Spaniards or any other white men, and claim to have practiced the art for so long a period that they have no traditions of a time when they did not possess it.

These ancient people were not tall, but rather under what we are accustomed to considering the medium stature. They were round-headed—distinctly so, and the effect of artificially deforming the head with papoose boards is present in some of the recovered skulls, which have a posterior flattening. Only a portion of the observed skulls are thus deformed, and whether it were a distinguishing mark reserved for their more prominent families or clans, or a new fashion in heads later introduced, is an undetermined question. Nor were all the deformed heads similarly distorted. Some were angularly flattened at the back, the inclination of the plane being forward across the crown; while others were so treated upon the rear upper corners of the skull, if we may use such an expression with reference to a nearly round object. Whether this were a gradation of distinction among those who were entitled to some such variation from the common run of cliff-dwelling skulls, or merely a change of fashion in the forms of distinguished heads, is another unsettled question.

Many of their habitations are perched aloft from five hundred to eight hundred feet above the bottom of the canons, in seemingly inaccessible nooks in shallow caverns of the cliffs, and upon precipices that appear to defy man's invasion of their summits. To reach and use these abodes in the daily routine of life must have required of their tenants the climbing agility of cats or squirrels. Some of the dwellings, sheltered by overhanging ledges, cling to the beetling walls of the canons, like the clay-built homes of barn-swallows under the eaves of a farmer's storehouse.

These edifices give evidence of most creditable architectural advancement, and in their construction their builders proved themselves possessors of much mechanical skill. The walls are plumb and correctly angled, while the openings for doors and windows are square and true. They do not appear to have understood the principle of the arch, as all the openings are angular. Most of the stones laid in the walls are shaped; not smoothly dressed, of course, but reduced to forms appropriate to their positions in the walls. The material used was the stone of the adjacent cliffs, and the mortar is apparently an alkaline silt eroded from them. Rooms in many of the dwellings have their walls plastered, the work evidently having been done solely with the hands, as numerous finger-marks and impressions left by the ancient workmen attest; and when they became black and grimy from smoke and dirt they were given another thin coat of plaster, some rooms having many layers thus laid on, with stratifications of soot and dirt regularly between them.

In frequent instances the walls are plastered, or rather, surfaced up with plaster, on the outside. The stone is laid in fairly regular courses, usually with binding pieces at the corners, of larger size, the walls generally being from twelve to thirty inches thick. Occasionally a domicile was made by merely building a wall across the front of a recess in the cliffs, but the greater number are compact structures within themselves. They are of various sizes, from those containing four or five rooms, up to the so-called "Cliff Palace" containing on the ground floor alone one hundred and twenty-four separate apartments. Most of the rooms are square, or rectangular, and average as large as those in a well-planned dwelling house of our times, though a considerable number are small enough to be called closets or bins. Many are windowless, and with but the one interior door-opening, must have been as dark as the conventional dungeon, in the absence of artificial light. Usually the outer corners of the structures were built in the form of circular towers rising above the level of the main part of the building. The interior of these towers afforded round rooms of larger size. When it is considered that the builders of these edifices, had no tools excepting those they fashioned from other stones, of flint or granite, their work gives proof, not only of the presence of menacing enemies, but of good craftmanship, endless patience and tireless industry.

That they were not an isolated people, far removed from contact with others, is proved by the fortress-like character of their homes in the cliffs. That they had not always lived perched up there in their cage-like domiciles is likewise shown by the widely distributed ruins in the valleys and over the surrounding uplands, identical in structural character, aside from the changes made necessary by the unlike locations; and by the weapons, pottery and other objects found in these presumably earlier habitations. The conviction that they had become a harried, hunted people, beset by feared, inveterate and destructive enemies, comes to the beholder of their strange, crag-borne, desolated homes. The earlier visitors to these places found many evidences of this. In several of the buildings groups of unburied skeletons were discovered, in positions indicating efforts at escape, with skulls crushed in as if by heavy weapons, but all lying where their former owners were struck down in what was probably the final act of a great tragedy.

The ruins in the valley and on the mesa are in exposed situations without any natural security, or special precautions for defense. They plainly seem to have been the habitations of a mild, unmenaced, agricultural or pastoral race which had enjoyed a long period of peace. Compared with the circumstances of these evidently previous abodes of these people, their later dwellings in the cliffs unmistakably seem to have been built as the refuges of bedeviled communities forced by enemies to leave their former habitations.

Some of the caverns in which these ruined abodes are built, are very large, and appear to have been excavated by the action of the elements. The river unquestionably did much of the work by its currents and eddies in ancient times when streams were great. There was a time when the waters of the Mancos lapped the stone floors on which these edifices stand. The old architects planned and built their houses to suit the natural circumstances of the chosen location, as there is no evidence that they attempted to enlarge the recesses.

There are some buildings so situated in the cliffs that to gain access to them the visitor of an exploring turn of mind must have mechanical assistance and safeguards. To reach them one must be swung down from above by means of a lariat hitched around the waist or under the shoulders, and the wise adventurer will be cautious that he does not prematurely discard the friendly cable. Most of them, however, are reached by steps cut or built into the cliffs, and at a proper height in the cliff wall hand-holds are cut in such form as to afford the hand a secure grasp. The inner, cup-shaped parts of these hand-holds have apparently been worn deeper than they originally were by the wind keeping eddies of sand grinding them out. In climbing even these more passable stairways, persons subject to giddiness would experience difficulty.

These queer folks were good potters and made great quantities of earthenware—water jars, jugs, bowls, crocks, mugs and the like; and it is noticeable that all are for useful purposes, their makers not having reached the stage of the alleged ornamental vase. Large water jars, holding several gallons, are no more than an eighth of an inch thick, and when struck will ring like a bell. Much of their work bears geometric figures put on in colors, some of these decorative patterns being artistic in their design and execution. On some bowls the figures of turkeys were cleverly produced. Others were relieved on their outer surfaces by corrugations or indentations, and by pinchings with the fingers after the fashion a housewife follows in bringing together the edges of her pie crusts. There was little monotony of appearance in the pottery, two pieces rarely being exactly alike. The vessels are shapely in form, some of them, indeed, being very graceful in their outlines. One kind, called "coiled" ware, was made by superimposed coiling of strands or ropes of moist clay until the vessel was thus built up to completion, the strands being pressed down to perfect cohesion. All their ware, some of which appears to have been glazed, was probably wholly the work of the hands, as there is no evidence that they knew or practiced the principle of the potter's wheel. The prodigious quantities of broken pottery with which the whole region is strewn can only be accounted for upon the theory of a very long occupation of the country. It is found everywhere. There are mounds and reefs of it buried from a few inches to a few feet under the surface by the wind-shifted dust and sands. It would take the domestic disasters of many generations of the whole of Denver, to produce as much wrecked ware as may be found on any square mile of the six thousand embraced in that territory down there.

In our Historical Society's collection of pottery from the Cliff Dwellings are several vases and bowls ornamented with designs which, in the judgment of a German antiquarian who visited Denver a few years ago, are identical with those upon similar objects found in India, and attributed to the Aryan people the antiquity of which takes us back to the dawn of the history of the human race.

The Cliff Dwellers understood and practiced the art of weaving and made garments of coarse cotton cloth, though it is not likely they were abundantly supplied with clothing. Fragments of what seem to have been blankets also appear. Under an inverted empty water jar which was buried in the rubbish in one of the houses, was found, a few years ago, a strand or small skein of soft, well-spun cotton yarn in good condition. Whether these people grew cotton, or acquired it from more southern tribes, is undetermined. Pieces of buckskin also are present among their personal belongings, but not large enough to indicate their original size or purpose. They made robes or blankets out of feathers, apparently those of the turkey, which were singular pieces of handiwork. These fabrics were wrought by tying overlaid feathers to a coarse netting of cord made from the fiber of the yucca or "Spanish Bayonet" plant, the work being very ingeniously done. They also had a cloth which was at first supposed to be of wool, but which proved to be of milk-weed fiber. They must have adorned themselves plentifully with strands of rude beads, of small bones, and of shells, if we may judge from the variety and quantity of home made articles of that kind strewn around. That they had acquired the tobacco or some other smoking habit is told by the pipes that they left. Their sandals, of which many have been found, were woven or plaited, some very closely, from various fibers they could command and utilize; and out of such fibers they made brushes, too. They also had mats and matting made of coarse grasses and reeds, and of willow twigs. The mummified bodies of their dead have usually been found wrapped in an outer sheet of matting. They produced good baskets, hampers and other wicker work to which, properly speaking, much of their matting belongs. Fragments of all these things, in every stage of dilapidation, are found in the houses. In carrying their burdens they used raw-hide straps through the handles of their hampers, jars, and other receptacles. The yucca fiber was made into cords and ropes, of which specimens exist. Certain sticks, shaped something like a sword, found in the ruins, were puzzling until it was seen that they were used to hatchel out fibers.

In several places large jars were sunk in the ground near the doors—probably as little cisterns for the reception of rain-water, whenever any happened to fall. In one house a bowl of walnuts was found—a nut that is not produced in that section of the country nor in Colorado, anywhere. They do not appear to have had any domesticated animals as, thus far, no remains of such creatures have been found in or around their habitations; but they do appear to have had the turkey, or some fowl closely resembling it.

Their weapons were, as with all races of men destitute of metals, limited to a few varieties of stone devices, but such as they were, they had plenty of them. Stone battle-axes of the usual form—of granite or flint, with a groove around the poll part where the wooden handle was lashed fast, are numerous; and so are flint spearheads of the willow-leaf pattern. Great quantities of flint arrow-points of the familiar shape are mixed in the rubbish everywhere. A bow four feet eight, and one-half inches long, with a string of sinew, has been discovered. Other weapons not found among the relics of ancient people elsewhere, are rounded flint stones, of a nearly uniform size that would snugly pass through a ring two inches in diameter. In the surface of these are carefully chipped slight depressions into which the thumb and first two fingers readily fit, giving the hand an easy, firm grasp upon the missile. It is conjectured that these were thrown by hand from the eminences of the dwellings at enemies in the canon below; and, in the hands of skillful and powerful men, they would inflict fatal injuries upon their human targets. The numbers of these stones in and around the buildings suggest that they were kept in stock much as our old artillerymen stored pyramids of cast-iron balls on their cannon platforms. After use, and departure of the enemy, the stones could be gathered up for another emergency.

"Spruce Tree House." (Photographed by Charles R. Horst.)

These unique weapons—for they were not sling-stones, such as the one our old-time friend David applied so effectively to the boastful Goliah—suggest mention of some peculiar objects seen sticking to the smooth walls of the cliffs and buildings in certain places. These are groups or clusters of splotched, sun-dried discs of clay, now quite hard. To account for these, conjecture again comes to our aid, and points out that they were balls of moist clay, made as boys of our time make snow-balls, and used by boys of that old time for practice-throwing at a target, to fit themselves for using the heavy, rounded flint stones later in life, when called upon to fight the ever-dreaded enemy.

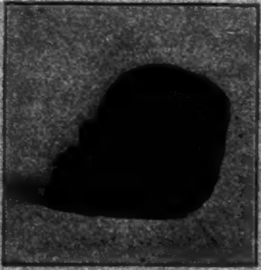
Everything connected with these people's relics seems to tell that they had not only to work very hard for a living, but to fight very hard for an opportunity to do it.

Their domestic utensils, aside from their pottery and basketry, would seem to have been limited to a few simple implements. They ground their corn by hand between flat stones, or pounded it with a stone, the grain being placed for that purpose in a saucer-like depression in another stone. Some of their pottery shows the marks of contact with fire, such as would follow use in boiling and baking food. Bone needles have been found in numbers, and other bones pointed at one end, which could now be used as marline-spikes for splicing ropes, are common. Sticks of hard wood, found charred at one end, were twirled on softer wood to obtain fire by friction. There are stone-tipped drills for making small holes, probably those in their beads and amulets. Stone mortars and pestles, knives and scrapers, and celts for dressing skins; bone awls and shuttles; and wooden needles, about complete the sorry inventory. They tried to keep their edge-tools sharp, for in many places are stones on which the marks of much laborious whetting appear.

The wood used in the buildings was mainly cedar, which, in that preservative climate is well-nigh imperishable. But much of it has disappeared by slow decay to dust for the winds to bear away, affording what is thought by some observers to be additional proof of the great antiquity of the structures. Many of the sills and beams were of good size and were laboriously hewed and squared with dull, clumsy, stone axes. The floors were made of cedar sills, with willow sticks laid close together on them and plastered or cemented over, the result being a fairly level surface. A few rudely-built fireplaces have been found, in which are the ashes and cinders of the inferior quality of coal to be had in the vicinity. Some of the rooms have no openings in their walls, access to them being gained through holes in their ceilings or the roof, thence down by a ladder.

On some of the interior walls, and, in a few instances on smooth places on the cliffs, are primitive attempts at picturing. Outlines of the human figure or parts of it, of the turkey, and of a few animals, with efforts at mural decorations the patterns for which being the same as the ornamentation on certain pieces of pottery. They are all meaningless, or, at best, in some of the life figures, possibly suggestive of isolated incidents. Upon the whole they are considered mere embellishments or the idle achievements of embryo artists, and not intended to be specific records of anything of consequence.

Maize, or Indian corn, was apparently one of their staple foods. In several of the round towers of the buildings, and in some isolated structures in the cliffs, small quantities of cobs and a little shelled corn have been found, indicating that these places were granaries. They also cultivated and used beans and squashes, as evidenced by the remains of these vegetables in the household rubbish. The arable land available for the cultivation of corn and vegetables would now be limited to small areas or patches in the valleys, and it was so then unless great climatic changes have occurred since the time these people occupied that country. This would, by itself, set back the period of their existence to a remote age. But they have left abundant proofs of their knowledge of irrigation, and of the need their meager lands had for it. In this their practice was similar to that of our own times; nourishing their lands with water brought in ditches.



One of their Skulls.

This suggests that the climate has not radically changed since they abandoned their fastness homes and disappeared forever. Buried in the dust and rubbish in their dwellings may yet be found loose grains of corn, with here and there some cobs still holding a few grains in place. These, though hard and shrunken, are probably as large as any of our present growths would be, after centuries of shriveling in an atmosphere so dry that all the moisture in the bodies of the dead was absorbed by it before decay set in. In the plaster on the walls cobs are occasionally firmly embedded, showing that they were put there when the plaster was soft, and that they are as old as the buildings.

The presence of soft, fine auburn hair, turning to gray, attached to some of the skulls found in or near the dwellings, seems to imply that these people were a mixed race, though generally their hair was black. The discovery of a considerable bunch of red hair strengthened this implication, and the two tend toward a conclusion that these Cliff Dwellers were at least not all like the native people now living in that southwest country. These have coarse black hair, and the other colors and textures are not known among those of pure blood. Some writers have asserted that many of the cliff people were white, or nearly so, but conclusive evidence of this is lacking.

We have referred in the foregoing to only a few of the conspicuous ruins, because it is not within the province of this work to take up this subject with any attempt at details. Volumes might be written upon it without exhausting the theme.

Indeed, little more than the surface has been scratched over, both in explorations of the antiquities and in recording the ascertained facts. In recent years the Bureau of Ethnology has given needed attention to the whole region of ruins and a good work has been intelligently and systematically inaugurated, though much of the time has been devoted to the antiquities of New Mexico and Arizona, where very large cliff dwellings are found as well as in the canons of the Mancos.

When it is considered that in these canons of the Mancos, alone, there are probably five hundred separate structures, many of them in the most unexpected places, the opportunities for research may be better understood. Future explorations, and especially excavations among the ruins in the valleys and on the mesas, are likely to reveal many more objects of interest, and may unlock secrets of importance in the history of these people.

Practically the explorations to this time have been confined to the cliff buildings, and little more of excavating has been done than to dig in the dirt and rubbish in them. In the vicinity of the older structures much stuff is buried just under the surface; a low mound, or a ridge, is a dust-covered deposit of relics. To our people it is still a new country. It is not yet a quarter of a century since these strange habitations were first intelligently observed and fairly well described. The land where the village of Mancos stands, a few miles distant, on the Rio Grande Southern railway, was not "taken up" until about twenty years ago, and as late as 1882 was traded for a horse.

A few miles above the canons is located the Wetherills' Alamo Ranch in the valley of the Mancos. These men, the father and five sons, located there some years ago. To their intelligent explorations of the ruins, and co-operation with others, much of the existing knowledge of details is due; they having recovered many objects in perfect condition, or nearly so. Of relics from the cliff dwellings, our State Historical Society has what is probably the most varied and complete collection that has yet been brought together, and one that is of exceeding interest to the antiquarian.

Those who believe that these cliff habitations of Colorado were abandoned long before the Columbian period, find a condition to sustain their views in the absence of all metallic substances from the relics of these people; for had they been occupied by even a few survivors at the time of Spanish inroads in the sixteenth century, those lonely beings would probably have picked up somewhere a few metal objects.

To every intelligent visitor to this unique land several questions at once arise, involving the origin, progress and disappearance of these people. As to the age of the ruined buildings, all is conjecture, nothing being known on which to base a positive statement. There are theories in plenty covering all the questions, no two agreeing, and one worth about as much as another, which is only one way of saying none of them fit all around. In this refusal to fit lies a great difficulty. A theory that seems good at first is soon upset by facts that had not been considered in its construction. In that dry climate the cliff buildings, protected as they are from wind and rain, and undisturbed by man or earthquake, might stand through an indefinite period of time, just as they may have stood five hundred, a thousand, or two thousand years.

We have referred to the round towers, frequently forming the front corners of these buildings. In the valley of the Mancos and among the ruins on the mesa, are found the remains of many isolated towers of similar form. They were mostly built of stone, and are something like the beginnings of huge chimneys. It would be hard to determine their purpose; they might have been watch-towers, places of refuge, or store-houses, or they might have been for uses that do not occur to civilized man. While most of them are now heaps of rubbish, a few are in a fair state of preservation. Pre-historic structures almost identical in form and character with these, are found in India, Sardinia, Ireland, and on the Orkney and Shetland islands. Referring to those in Ireland and on the Orkneys and Shetlands, Sir John Lubbock, the noted English antiquarian, says:

"They have been supposed by some to be Scandinavian, but no similar buildings exist in Norway, Sweden or Denmark, so that this style of architecture is no doubt anterior to the arrival of the Northmen."

Round Tower, Mancos Valley.

We have an engraving of one of these Mancos valley towers. The structure, though in a ruined condition, stood a few years ago about twenty feet high, and in its shape and general appearance, even to the doorway, several feet above the ground, is a duplicate of towers still standing in Ireland, Sardinia and India. These towers in the Mancos country were undoubtedly built and used by the Cliff Dwellers, but the presence of ancient objects, of man's handiwork, resembling each other so closely, in parts of the earth so widely separated as Colorado, Ireland, Sardinia, and India, may imply something more than mere coincidence, and be held to suggest probable remote kinship of their builders.

Assuming that climatic conditions there were about as they are now, and the drift of evidence is toward such an assumption, it seems strange that so large and so industrious a people would have occupied for so many years as these evidently did, a region so inhospitable, when far better places must have been known to them. This makes us turn again to the theory that they came there so long ago that climatic changes enfeebled them and the region to such a degree that the weakened and decimated people at last fell an easy prey to predatory enemies.

The present condition of the country causes the visitor at once to wonder how the people of the cliff houses supplied themselves with water. Many of the buildings now have no supply near them, and if it were so then, it must have been an endless and laborious undertaking to get enough for the absolute needs of the swarming tenants. Nowadays even small parties are often sorely inconvenienced by the lack of it. Over the great region of ruins the scarcity of water constitutes the curse of the country. So, these cliff people had need for their numerous water jars. The Mancos river carries water, of course, but of so bad a quality, from alkali and other offenses, that it is only used in dire emergencies. That the old people were hard put to it for a supply, is evidenced by the large "tanks" they constructed on top of the mesa to catch and hold the occasional rainfall. These reservoirs appear to have originally been natural depressions which the people deepened and walled up, as some of them, unimproved, may still be observed. Occasionally, in the lateral canons, after the streams have died away, there will be here and there a pool of water.

Of their religious notions and customs but little is indicated by their recovered relics. In common with all humanity, they anticipated a future existence. This is shown by certain practices pertaining to their dead, and by the care with which they prepared some of these bodies, mummies of which have been discovered in their homes. In these the results of their practices resemble those seen in the mummies of ancient Peruvians. The bodies, with the knees drawn up near the chin, were clad in a coarse, cotton garment or covering, and then encased in an outer wrapping of matting which was drawn around and sewed fast, so that they had the appearance of bales of goods. The body of an infant, dried away to little but bones, was wrapped first in cotton cloth, over which was a feather cloth, and outside of all a coarse willow matting. The number of observed human remains is by no means proportionate to what the population of the communities must have been.

In undisturbed periods their burials were made in the valleys, and on the mesa, where there was depth to the soil, but these places of sepulture have been little disturbed. They deposited weapons and utensils with the dead for the future use of the deceased. The presence of these few, but carefully wrapped bodies, in some of the cliff houses is accounted for on the presumption that the persons died while the last besieging enemy was near at hand. This conclusion appears to be strengthened by finding human remains under the floors, in little cubby-holes of rooms, among the accumulated dirt, wreckage and refuse heaped in the lower recesses back of the houses, and in other apparently emergency places of deposit; all suggesting death amid the final conflict which allowed no opportunity for any other disposition to be made of the fallen. In several places bodies were found stowed away in small, horizontal clefts in the cliffs, near the larger domiciles. There is so little soil on the projecting ledges and along the bases of the cliffs that burial in it would be difficult; and therefore these bodies are supposed to have received emergency disposition, also. A few were found walled up in small rooms.

As we have stated, these instances of special care for the dead, are all that have been observed that may be considered as having association with religious beliefs. Nothing directly bearing on their rites and ceremonies has yet been revealed. If they were ever under Aztec influences there has been nothing found to indicate the effect of such influences. There has been a common belief that these people worshiped Montezuma. If the present pueblo tribes are descendants of the Cliff Dwellers they may have received their peculiar religious beliefs and customs among their other inheritances. Of this, A. F. Bandelier, one of the most capable of American antiquarians, in a "Report on the Ruins of the Pueblo of Pecos," published in 1883, said:

> "What the Indians themselves say of this tale, I have not as yet ascertained; but the people of the valley all assert that the people of the pueblo believe in it; that they even affirmed that Montezuma was born at Pecos; that he wore golden shoes, and left for Mexico, where, for the sake of these valuable brogans, he was ruthlessly slaughtered. They further say that when he left Pecos he commanded that the holy fire should be kept burning till his return; in testimony whereof the sacred embers were kept aglow till 1840, and then transformed to Jemez.
>
> "There is one serious point in the whole story, and that is the illustration how an evident mixture of a name with the Christian faith in a personal

redeemer, and dim recollections of Coronado's presence and promise to return, could finally take the form of a mythological personage. In this respect, for the study of mythology in general, it is of great importance. That the sacred fire had originally nothing at all to do with the Montezuma legend, is amply proven by the earliest reports.

"It will also become interesting to ascertain in the future how many pueblos, and which, concede to the Pecos the honor of being the birthplace of that famed individual, and how many, as is the case with other great folks in more civilized communities, claim the same honor for themselves.

"I cannot, therefore, attach to the Montezuma tale any historical importance whatever, not even a traditional value."

The walls of the old church at Pecos in which the holy fire was to have been kept burning, are standing in a deserted village a few miles southeastward from Apache canon. Its roof-timbers and wooden columns were covered with allegorical carvings which were colored in the artistic manner characteristic of decorations applied to the handiwork of the present pueblo people.

It is, of course, not unreasonable to assume, in the absence of evidence to the contrary, and considering the many presumptive parallelisms between the modes of life of the Cliff Dwellers and those of the modern pueblo Indians, that the religious beliefs of the ancient people were similar to those of their probable descendants.

This old Pecos tradition, whether true or not with regard to the Montezuma legend, is particularly interesting with respect to another matter. The claim that Montezuma was born at Pecos shows that those people have no tradition of ever having, for many centuries, lived in any other place; and, therefore, if the pueblo tribes are descendants of those who, at some time in the past, were forced to abandon their homes in the cliffs, the eviction must have taken place at an extremely remote period.

The ancient astronomers in their efforts to explain the puzzling movements of Jupiter, conceived a theory that his motions were in epicycles. He appeared to be waltzing around in little circles as he progressed in his greater orbit around the sun. As waltzing without a companion is a most unsatisfactory performance, and to account for the singular circumstances of Jupiter's apparent conduct, they provided him with a fictitious partner, whose attraction was pretended to be deemed sufficient explanation of his persistent traveling in the short circles, when he should have been attending exclusively to his orbit.

Likewise, it seems, in efforts to explain the origin of people in the southwestern part of North America, a mythical race, the Toltec, has been brought in to fit the circumstances of the case and to furnish a basis upon which to build. Certain events appear to have taken place, and certain things appear to have been done, but the when and the how, may not be told. Therefore the Toltecs served many convenient purposes, but as people of fact, they are not much more tangible than the companion of Jupiter in his waltzes. They are supposed to have gone into Mexico from the north or northeast more than a thousand years ago, to have overrun that country, and afterward to have been conquered by the Aztecs. It has been assumed that there may have been some connection between these mythical people and the ancient house-building tribes of our large district of ruins.

"Gibralter House."

There have been a great many other assumptions, too, more directly concerning our cliff-dwelling friends. They are held to have been an alien race of invaders who were exterminated by the native people chiefly because of their foreign character; also, that they were of a stock wholly different from the mythical Toltecs, the later Aztecs, and the modern pueblo Indians. Some, as we have mentioned, have it that they were white people, or that enough of them were to dominate all and control affairs. Others ascribe to them a Toltec origin, and attribute their destruction to the ravages of hordes from Asia, who also took possession of Mexico and became the progenitors of the people Cortez found in that country. The present pueblo tribes are accused of having once been vagrant bands from Mexico who found abandoned buildings suited to their homeless needs and took possession of them; and in their later constructions in places to which they made a change, imitated the older works, with which they had become familiar. Some writers have gone so far as to map out the form of government under which these old-time folks enjoyed life, liberty and pursuit of happiness, dividing it into three co-ordinate jurisdictions, civil, military and religious; and have provided them with a system of theology calling for worship of serpents and the sun and various fetiches, which was assisted by a great fear of witches instead of a dread of our horned and cloven-footed friend. Those provokingly and persistently missing people, the Lost Tribes of Israel, are not without their advocates who see, or think they see, some reasons for associating those old Jewish tribes with the race which erected and used these buildings.

There is a variety of other theories, all likewise tending away from according any connection between these old-time people and the existing tribes of house-building Indians, if they are Indians, in the southwest. In a general way those who entertain these views somewhat petulantly, and altogether needlessly, resent conclusions that point to such a connection, and seem disposed to regret the appearance of evidence calculated to impair their various theories.

On the other side, and there is a broad other side, the present pueblo Indians of New Mexico, look, live and act as if they were the direct descendants of this ancient race. They do not build cliff houses, but they build and live in other kinds of community houses, usually terraced. Some of these cliff houses were terraced, and if the buildings in the neighborhood valleys and on the surrounding mesas were not so completely wrecked by time, we might have found some of them terraced. These pueblo tribes are not now by their own intention much more than half-way out of the age of stone, and in many of their daily practices they are like these old people seem to have been. They grind corn the same way; weave, and make pottery, by hand; have brushes of stiff grass; till their narrow fields with the most primitive of implements; care for their dead in much the same manner; and in a variety of minor details their domestic affairs and daily life closely resemble those we must conceive to have been familiar to the Cliff Dwellers. They have their assembly chambers, where a fire burns in a pit at the center of the floor, and where they go through with their mystical ceremonies. Those, who, in recent years have come in more frequent contact with the irrepressible American white man, have modified their customs and practices in some degree; but the still comparatively isolated communities remain most primitive in their dress, habits and traditions. They live just as they did when first seen by the Spaniards in the sixteenth century, their venerable habitations—large community houses—perched on bold headlands jutting out into a sea of sand, or on lofty islands of rock standing in the midst of such a sea, and wrapped in a seeming haze of antiquity. The Moqui Indians think and claim they are the descendants of the ancient cliff people of the north, and in this they are encouraged by an old tradition of the Utes.

The Ute Indians, so they say, have always believed that the Moquis had the Cliff Dwellers for ancestors, and are exceedingly superstitious about the ruins. They avoid them, and have resented their exploration because of a fearsome belief that evil will follow disturbance of the homes and bones of the ancient race.

Even with the apparent probability of an overwhelming disaster having befallen the older people, it is not to be presumed, we are told, that they were annihilated—that none escaped. It is rather to be taken, it is said, that there were survivors of the foe's final onslaught, and that these, fleeing headlong from their former homes, established themselves elsewhere, and began life anew. Therefore it is not at all improbable that the Moquis and some other pueblo Indians, with their strange rites and ceremonies, their peculiar modes of life, and their singular general character, had for ancestors some of the peoples who once lived in the cliffs of the Mancos canons.

But all the theories put together do not change the extraordinary known facts. These people came to that country sometime in the long ago; if they brought their semi-civilization with them they must have then been a very old race; if they developed out of savagery in the region where they built their homes, that process was one covering many centuries. Their attainment of the ability to conceive and construct their great buildings must, therefore, have been far back in the past, for their venerable, ruined structures were not built nor did they decay in a day. Furthermore, those of the cliffs represent, not the last generations of their builders, but those of a period in which the race was still capable and still hopeful, with the aid of great achievements commensurate with their needs, of long sustaining themselves against the assaults of their enemies. Such monuments as they left were not the conceptions and executions of a seriously weakened and despairing people. They are, of course, unmistakable evidence of a grave danger from formidable foes, who finally did overwhelm their builders; but this came long after the Cliff Houses were planned and constructed, for they abound in testimony to their occupation by many generations of men. These are, we think, facts that even the theory that these people have living descendants, does not disturb; but they certainly do not bring us any nearer an explanation of what may as well be frankly called the mystery associated with these remarkable, and certainly pre-historic, ruins and their builders.

Elsewhere in southwestern Colorado, and apparently the work of other ancient people, pictographs and rock-carvings exist. Of the latter some typical examples were discovered by Captain E. L. Berthoud of Golden; his account of them appearing in the report of the Bureau of Ethnology for 1882-83, from which we quote:

"The place is twenty miles south of Rio Del Norte, at the entrance of the canon of the Piedra Pintado (Painted Rock) creek. The carvings are found on the right of the canon, or valley, and upon volcanic rocks. They bear the marks of age and are cut in, not painted, as is still done by the Utes everywhere. They are found for a quarter of a mile along the south wall of the canon, on the ranches of W. M. Maguire and F. T. Hudson, and consist of all manner of pictures, symbols, and hieroglyphs, done by artists whose memory even tradition does not now preserve. The fact that these are carvings, done upon such hard rock, merits them with additional interest, as they are quite distinct from the carvings I saw in New Mexico and Arizona on soft sandstone. Though some of them are evidently of much greater antiquity than others, yet all are ancient, the Utes admitting them to have been old when their fathers conquered the country."

In our references to these pre-historic peoples in this and the preceding chapter we have used the words "extinct," "departed," "vanished" and synonymous terms, but we wish to be understood as employing them in an abstract sense rather than a concrete. We have neither desire nor intention to stand over among some theorists upon American pre-historic questions, of whom Winsor's "Narrative and Critical History of America" says:

Mummy from a Cliff Dwelling.

"Few * * * in discussing the problem could say, 'I have ventured to inquire,' without presuming to decide."

It is wiser, perhaps, to wait and see. As a recent writer puts it, "it is the business of the archæologist to learn and tell you, or guess and tell you, when they lived, where they come from, and whither they have gone." This, the archæologist has not yet been able to do.

The preservation of these antiquities commands the approval of every intelligent person. The region is open to predatory visitors and much wanton vandalism has been committed. Walls have been overturned, and relics of great archæological value have been destroyed or carried away to be hidden from those competent to appreciate their worth and to derive rational conclusions from them. Now that the Ute reservation has been thrown open to settlement still more vandalism and wanton destruction may be expected unless some authority is interposed to prevent such inconsiderate acts.

To the end that such authority might be interposed an earnest movement was inaugurated in 1898 by the Federation of the Women's Clubs of Colorado to secure proper action by Congress. In consequence of this a bill was introduced in Congress in the winter of 1899-00 by Representative Shafroth to set the region apart as an United States reservation. At the time of closing our record the bill had not become a law.

The slender knowledge we have of these old races has come to us through the shadows of many years. That the Cliff Dwellers, as compared with the Mound Builders, were of a less remote era, is more than a probability. Though small in numbers compared with the great pre-historic nation of the Mississippi Valley, and with their kindred occupied a territory of comparatively limited area, they had progressed out of savagery and were traveling the road leading to civilization. While dwelling in a region certainly not now favorably conditioned for supporting multitudes of inhabitants, they undoubtedly did constitute, within its limits, a large population—in many localities a dense population. Beyond this, their silent, ruined homes, surrounded by abundant wreckage of other handiwork of theirs, have not afforded us any satisfactory information.

Both races appear to have been destitute of every form of record-making intelligence and method, as neither has transmitted to us, so far as known, any kind of intelligible inscription, hieroglyphic or recording picture-writing. It is singular that peoples capable of doing all that the Cliff Dwellers did, or so far advanced and so great in numbers and physical achievements as the Mound Builders certainly were, should have been without this form of knowledge. As in the ruins of these habitations on the southwestern mesas and in the canons there, no record of any sort has ever been found in the hundreds of the other people's mounds of earth, that have been so carefully searched for some clue that might suggest who they were and when they lived. Not a thing has been revealed in either.

These human beings, whose works live after them, have left us many mute but significant object-lessons; further than this—the periods of their existence, the centuries through which they lived and loved, struggled and fought, and vanished into the obscurity of a deep oblivion, are but the landscapes of the twilight and the darkness.

CHAPTER V.

The Indian of Historic Times—Theories of Origin—Families and Tribes—Former Territorial Locations—Linguistic Divisions and Ethnical Differences—Two Distinct Types of People—Languages and Personal Nomenclature—Present Numbers—Character, Methods and Peculiarities.

The copper-colored man, the ancestor of our Mississippi valley Indians of the historic period, appears to have been too late in his arrival to have had the distinction of being the first inhabitant of this broad land. We speak of him and his descendants as the aborigines, and the old books used to teach us so; but we now have some fair reasons for believing that when he came upon the stage the actors in the earlier scenes of the great drama had gone down into oblivion unknown centuries before.

So far as the little knowledge we have of his predecessors enables us to see into the heavy shadows that shroud the story of man's presence here in ancient ages, it reveals to us the Indian next taking a place in the misty column of humanity. If, in the long lapses of years since the man of the glacial era held sway, there were peoples on this continent other than the strange race which once populated the great valley of the Mississippi; or other than those who erected the long-abandoned structures in the canons and on the mesas of the southwest—and there may have been many—they rose, flourished and passed away, leaving no record of their existence that has become known to the modern generations of men. Therefore, no better can now be done than to separate the hazy procession into these rather uncertain divisions, with the Indian at the rear, nearer and clearer to our view. But far out where the Indian front should blend into the ranks of those ahead of him, the mist drifts in and thickens to a fog, and to our sight the figures lose themselves in its depths.

There has long been a disposition to assume that the Indian must have come from some other part of the world, but we find ourselves with precious little information, traditional or otherwise, as to where it was or when he migrated. The evidence, such as it is, indicates fairly well that he succeeded an ancient and more advanced people, but, as to who they were and how it happened, there is almost nothing to definitely tell. Whether he found those people in possession of the country and had to silence their claims after the fashion in which his own were silenced in a period perhaps thousands of years later; or whether he found a vast region long abandoned by earlier races and awaiting his peaceful occupation, will remain questions as puzzling as those which attach to the shadowy history of his ancient predecessors.

If, in their beginning in this country, the Indians were intruders in the sense that the white man later became one, their origin is as much a mystery as the fate of those before them; and if they are to be regarded as indigenous products of the country, the problem is brought no nearer a satisfactory solution. They had some traditions bearing upon these interesting questions, but none worthy much credence, even as traditions. Their methods of transmitting them were somewhat shaky, and we should not look for the quality of accuracy in these old stories.

The Rocky Mountains not only constitute a great natural barrier separating the territory of the United States into two distinct geographical regions, but mark definite natural differences in many other respects. The "Continental Divide" appears to have divided not only the continent, but the native races of the United States, as they are known in the historic period. As a rule the savage tribes which occupied the territory drained into the Pacific ocean, were people different in most respects from those to the eastward of the mountains. They were, with few exceptions, distinctly a round-headed type, with physical appearance, manners, customs and traditions radically and irreconcilably adverse to those of the others. In these characteristics there are some hints of the Mongolian and Malay, and some other reasons for suspicion of Asiatic origin; though the obscurity of linguistic traces of such relation lies in the way of assigning that origin to them with approach to certainty.

The Indians who dwelt in the United States east of the Rocky Mountains, in the country drained into the Atlantic, and the Gulf of Mexico—with the exception of part of the Rio Grande region—were very decidedly another kind of people. They were of the long-headed type of men like those of western Europe and northwestern Africa, and beyond this, excepting a small resemblance in some forms of speech with those of an isolated clan in Spain, there was nothing very tangible in the physical or mental qualities of these Indians that requires us to assume for them a foreign origin. They were certainly free from every well-grounded suspicion of Asiatic descent. Geographically there were some interminglings of the long-headed and round-headed races, but they were not more than could be accounted for by emergencies in the varying fortunes of one or the other. Andreas Retzius, the founder of scientific craniology, pointed out that the Rocky Mountains thus divided the native races of the United States into two distinct types.

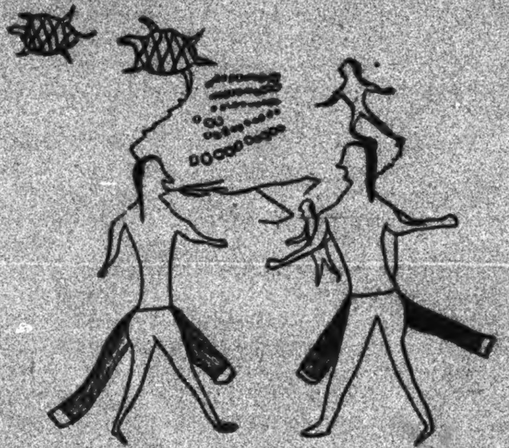
The eastern Indian, as we may call him for convenience, with his strong, well-defined racial features; his hair with rare exceptions always black, coarse, glossy and long, like the mane of a horse, round in cross section, and persistent to extreme old age; a slight beard when suffered to grow, always straight and never wavy; eyes small, black, somewhat deep-set, piercing and always horizontal; eye-brows black, narrow and very much arched; prominent cheek-bones and nose, the latter often very long and aquiline; his peculiar, copper-hued complexion; his habits, manners, customs, beliefs and traditions; all these stamped him as a definite type of humanity—one of the four great divisions of mankind as separated along the lines of color. It is true that the color was not uniform; some tribes were darker than others, but all were of that coppery tinge that has not been found on any other race of people in the world. If Columbus and his fellow-voyagers had not supposed India was before them when they sighted Cat Island, these people would probably have received some other and more appropriate name than the one they bear.

When the New England colonists settled themselves on the Atlantic coast and took possession of that country in the name of God and of their King, they began without delay the work of exterminating its red inhabitants. While they were employed at this task they also engaged in sundry speculations as to the origin of the troublesome people who were so unreasonably objecting to surrender of the land that had been theirs for more generations than they could tell, and who violently resisted destruction at the hands of the aggressive pale-face. The New England theory took on, of course, a serious cast, and ended in a conclusion that inasmuch as they could not account for the Indian in any other way, he must be a descendant of the Lost Tribes of Israel. This proposition, so far as any theory concerning the red man's lineage could be considered of much importance, met with rather general acceptance at the time, and was duly transmitted to posterity. Contrary to what might have been expected to follow such a conclusion by these straight-laced folks, the New England extermination of Israel's alleged descendants went bravely and steadily on. Theoretical association with the white man's religion was of no advantage in conflict with the white man's practical plans and purposes. These worthy New England pioneers, according to an old chronicler, "first fell on their knees and then on the aborigines."

The Indian of these plains, like his brethren farther east and down to salt water, had made little advance from a primitive state when the white man came into his country; and of his own volition he has not done much better since then. He was practically destitute of art, and his mechanical ingenuity was barely sufficient to apply the bow and arrow to the necessities of his existence. His other weapons and rude implements, legacies from some ancient race, were of a form that suggested their uses to him, and he adopted them. He constructed no permanent habitations, and the vast extent of country over which he roamed contained nothing of his work which the elements would not have removed within a few years—in strange contrast to the abundant and enduring monuments left in many places by an earlier and unknown people.

He had no method of reducing his form of speech to the written signs of a language. It was limited to practically arbitrary sounds, and he was incapable of making intelligible permanent records. The nearest he came to that was in a rude form of picture-writing. This, like his speech, was arbitrary in its contrivance—a figure employed having no common meaning. In recent years after closer and dependent contact with the whites he made some development of his picture-writing, but that was more in the direction of greater mechanical skill than in the artistic sense employed or the evolution of a written language.

In the accompanying illustration we have an example of this picture-writing. It is a copy of a pictograph letter sent by mail a few years ago from a Southern Cheyenne named "Turtle-following-his-Wife," and who was a ward of the Cheyenne and Arapahoe Agency in the Indian Territory, to his son, "Little Man," at the Pine Ridge, Dakota, Agency. Drawn on a half-sheet of writing paper, it was without a word written; the address on the envelope, "Little Man, Cheyenne, Pine Ridge Agency," having been inscribed by some white man at the first-named Agency. Little Man readily understood it to mean that his father had caused to be sent him the sum of $53.00 to enable the son to visit the father in the Indian Territory. By the same mail the Pine Ridge Agent received from the Cheyenne and Arapahoe Agent a remittance of $53.00, with instructions to pay Little Man the money, which was for his expenses to and from a visit to his father. But Little Man had eagerly explained the meaning of his queer letter before the Agent told him of the receipt of the remittance letter. In the pictograph appears over the head of the large figure to the left, the turtle following the turtle's wife, with a crooked line extending to the head of the figure; and over the head of the other large figure, with a connecting line, is a drawing of a little man. Over the right arm of the last mentioned figure is a drawing of another little man in the act of springing or advancing toward Turtle-following-his-Wife, from whose mouth extend two lines curved or hooked at the ends as if drawing the small figure toward him, suggesting "come to me." The two large figures with their name-totems attached represent the father and son, and between and above them are fifty-three roundish objects signifying an equal number of dollars. The breech-cloths on the two large figures indicate uneducated, half-civilized Cheyennes.



Cheyenne Pictograph-Letter.

In the condition the white man found him the Indian was thoroughly a savage. His life was rude, and here in the west he subsisted almost wholly upon the results of the chase. Next to the great warrior, the most successful hunter became the most praiseworthy member of his tribe. Disease, and the savage methods of treating it, played havoc with him; and he became almost constantly engaged in destructive warfare with his neighbors, red and white. Diseases new to the Indian, and weapons of equal novelty—including the bottle—were chief among the trouble-breeding acquisitions he received from the whites. Between these decimating forces his numbers were kept within limits that gave the great country he occupied an exceedingly sparse population. Whatever may have been the retarding causes before the white man came, these were certainly sufficiant and effective ones after he got here.

The eastern Indians of the historic period—those occupying that part of the United States between the Atlantic seaboard, and, say the longitude of Denver, excepting New Mexico and western Texas—were divided into eight groups or families, separated along linguistic rather than ethnical lines. These were the Algonquin, Iroquois-Huron, Dakota (Sioux), Catawba, Cherokee, Uchee, Mobilian and Natchez. The tribes of the last-named five, under various tribal names, occupied a region that may be outlined in a general way, by describing it as lying south of the latitude of the southern boundary of Kentucky, and east of the Mississippi river; though some of them were a little farther north in places, and others roamed some distance west of the lower Mississippi. The Iroquois-Huron tribes were east of Lake Huron, north and south of Lakes Erie and Ontario, in a district including the eastern half of Ohio, about half of Pennsylvania, nearly all of New York, and a large portion of Ontario. The Algonquin tribes were east of the Mississippi, beginning at Lake Superior and sweeping down to the south line of Kentucky, thence around northeastward along the Atlantic watershed, through New England up to the St. Lawrence river and its great estuary; thus fronting the Iroquois-Hurons on three sides. The Dakotas, or as we better know them, the Sioux tribes, with their numerous kindred and usually allied branches, dominated between the Mississippi and the Rocky Mountains from north of the international line down into Texas. But in the territory of each of these general families there were here and there intruding offshoots from some other family, apparently long isolated from the parental stock. The Winnebago Sioux occupying Algonquin territory in southern Wisconsin, were such intruders; and the Arapahoe tribe of our own locality is believed to have been an offshoot from the Algonquin family.

The western linguistic families or groups—those having their ancestral homes on the other side of the continental "divide"—were, in the main, of two general divisions, the Shoshonean and the Athabascan.

The Athabascans are not properly of United States territory. They occupied almost the whole of British Columbia and Alaska, but branches of them made their way southward in some early period and became permanently established. Practically all our Pacific coast Indians, those of Washington, Oregon and California, with straggling bands east of the Sierra Nevada, are of this family. In the southwestern part of the United States they have powerful representatives in the Navajoes, Apaches and a part of the Lipans. Those on the Pacific coast are divided into a great many small tribes and bands, low in the scale of humanity, both physically and mentally, but usually of a mild and peaceful disposition. The southwestern branches are of a higher and much more vigorous type, and their present numbers in the United States exceed twenty-five thousand. They are now all on reservations.

The Shoshoneans—sometimes called "Snakes"—occupied the larger part of the great interior basin with small branches in eastern Oregon in the northwest, and larger ones on the plains to the southeast. Their tribes varied in numbers from large bodies to small bands of vagrants, and in their physical and mental qualities from the shrewd, energetic Utes and Comanches to some of the most degraded types of Indian mankind. Their territory included Idaho and Montana in the north, thence southward to about the north line of Arizona and southeastward into Texas where the Comanche branch held sway. All the Shoshonean tribes, of which there are a dozen or more, are now on reservations, and in the aggregate they number near fifteen thousand.

The classifications that have been mentioned embrace the larger and more important tribes. There are many other groups of diminishing numbers and consequence, from the Salish or "Flathead" family, in the northwestern part of the United States, which includes about six thousand persons, down to remnants of minor families on the verge of total extinction, through assimilation by stronger divisions, and by various other causes.

These Indian families or stocks have been identified and separated by linguistic characteristics, the ethnical lines being insufficient for such a purpose. So close is the general physical resemblance between the Iroquois-Huron, Algonquin and Sioux groups, that the identity of some of the plains tribes formerly roaming at will through this region, remains to be satisfactorily decided by a study of their languages more exhaustive than has yet been made. Language with its hints and suggestions of consanguinity with others around it, while not always an unerring guide, is upon the whole the most convenient and probably the far more certain basis of classification; though to regard it as conclusive would lead to error. The ethnical elements must always receive more or less consideration; and sometimes geographical divisions come in, yet they are the most uncertain of all. So it results that language is the more accurate of any of the available means of identification, and without it it would have been impossible to determine the affinities of many widely separated tribes. The Apaches were thus discovered to be of the Athabascan family far up in British North America.

The character of the Indian forms of speech argues a very great antiquity and an independent evolution of the red men's languages. As the course evolution followed differed entirely from that pursued by the idioms of the old world, it follows that the first appearance of these people in America, if they did come from the other side of the oceans, must be thrown back to a time when slow diffusion might be conceived as equally probable from an eastern or western starting point. It has, at least, been rather clearly demonstrated that, while differing widely among themselves, the Indian languages not only betray no affinity to any other tongues, but belong to an absolutely distinct order of speech. This uniqueness is probably the most convincing evidence of independent origin, though it should be said that among some of the tribes we are terming eastern Indians, there are a few idioms slightly resembling in construction some used by the Basques, a people in Spain who claim descent from a great antiquity. But no other old-world tongue has any broader hint of similarity; and even the Basque has no suggestion of much strength. It should be stated here that there are in the Indian vocabularies, as in every tongue in the world, a few words much like some, of similar sound and meaning, found in other languages; but this common coincidence is destitute of significance. The Indian speech is to a great degree, a jargon that must be assisted in its efforts to convey thought, by many signs and gestures.

The Arapahoes, whose vocabulary was a very simple one and narrowly limited in its scope, used many signs and gestures; so many, indeed, that it was with the greatest difficulty they could make each other understand in the darkness. To make a stranger from another tribe comprehend them after nightfall they would have to pow-wow by a camp-fire where all the movements of their hands could be seen. It is related of a Blackfeet Indian that he and his squaw, the latter being of another tribe, had been married more than three years without either having taken the trouble to learn a word of the other's speech, but habitually addressed each other by signs and gestures.

J. W. Powell, Director of the Smithsonian Institution's Bureau of Ethnology, in a paper on "Indian Linguistic Families of America, North of Mexico," which appeared in the annual report of the Bureau for 1885-86, thus warns us against assuming some degree of relationship to exist because of vagrant similarities of sounds or words in speech:

> "Coincidence in the nature of superficial word resemblances are common in all languages of the world. No matter how widely separated geographically two families of languages may be, no matter how unlike their vocabularies, how distinct their origin, some words may always be found which appear upon superficial examination to indicate relationship. There is not a single Indian linguistic family, for instance, which does not contain words similar in sound, and, more rarely, similar in both sound and meaning, to words in English, Chinese, Hebrew, and other languages. Not only do such resemblances exist, but they have been discovered and pointed out, not as mere adventitious similarities, but as proof of genetic

relationships. Borrowed linguistic material also appears in every family, tempting the unwary investigator into making false analogies and drawing erroneous conclusions. Neither coincidences nor borrowed material, however, can be properly regarded as evidence of cognation."

In the Indian speech words, if they may be so called, are formed by hitching together many sounds, each conveying part of the aggregate meaning, with the consolidation expressing what we would convey by a sentence of some length. It was a building up, a putting together of a variety of sounds, and calling the result a word. One writer on this subject says "the Shoshones and some other western tribes reached the very acme of polysynthesis in which all the parts of the sentence often became by indefinite composition and syncope, fused into one interminable 'bunch-word' of from ten to fifteen syllables, and quite often many more." It is this feature, the "much putting together," that gives the Indian people their first and greatest claim to be regarded as truly a race developing on the soil it dwelt upon, in the same sense in which we regard the Caucasian and Mongolian races as having had independent development. But this does not absolutely establish the red men, from their very beginning, as a distinct, isolated type of humanity in the vast country they once occupied here.

That which practically all of the eastern tribes had in common is reducible to one physical and one mental quality; the generally similar texture and blackness of their hair, and their built-up form of speech. These may point directly toward primordial unity of origin. The endless variety of linguistic detail would seem to imply, as we have said, a great antiquity and possibly an independent development on the American continent; but, in the complicated characters forming the Chinese system of writing, a single group of connected marks having the meaning of a whole sentence, is something of the same method of expressing thought as that employed by our Indians in their many-syllabled words. This, of course, brings in the ghost of a suspicion of possible Asiatic influence, that is both confusing and contradictory; but the weight of trained judgment is against considering it of much importance.

The Indians of these plains were almost wholly derived from two of these linguistic stocks or families; the Algonquin and the Sioux. The latter predominated in numbers and influence, and claimed to have dwelt in the treeless region from time immemorial; the others were intruders who had been separated from the parental groups by some of the many exigencies of Indian life. Those of the Rocky Mountains region, and of that to the southward, came from the two other prominent groups, which also had widely scattered branches.

Within a kind of general limitation, they were all a wandering lot of people living a life necessarily one of hardship and uncouthness. Early in the last century small-pox assailed the Sioux on the upper Missouri and rapidly spread over the plains from tribe to tribe. The consequences of such a disease among such a people may be imagined. They were swept away by thousands, their mode of life and methods of treating disease removing all obstacles to the progress of the pestilence.

The religious beliefs of the Indians centered, in a loosely-defined way, upon the common theory of a Great Spirit, but aside from that they had many vagaries which were to a great degree astrological in their prevailing character. There was always more or less of alleged sun, moon, and star potency in them, but these astrological superstitions were far more pronounced among those west of the Rocky Mountains than with those to the eastward; some of the western tribes developing them to actual worship of celestial bodies.

Indian personal nomenclature was certainly unique, and to us appears very comical. In much of their general appellative conceptions there is poetry and beauty. In their names of rivers, places and localities, many words of exceeding beauty, both of sound and meaning, have been preserved and incorporated in our language. But in their personal appellations, in recent years at least, they were not so happy.

We have here two authentic lists of Sioux personal names. The first is the roster of a band of Ogalalas at Standing Rock agency in 1883, reported to Major McLaughlin, the agent then there, by "Big Road," their chief, who was required to give an account of his followers when they arrived at the agency. Big Road was described as "a most ignorant and uncompromising savage," who, with his people, had been hostile, having been associated with Sitting Bull in the then recent outbreaks of Indians under that noted chief. The translation of the names was made by the agency interpreter and is literally exact. In the form of rude pictographs they were all on one large sheet of paper sent to the Interior Department as part of an agency report. Four of the names, "Blue-cloud," "Lone-woman," "Deaf-woman," and "Red-flute-woman" are those of women in the band who stood as the surviving heads of clans or families, the braves who should have been in their places having been killed. These women represented the departed ones in order to draw rations and allowances to which they and their dependents would become entitled under the peace regulations. There were eighty-four individuals in this party:

Big-road.
Bear-looking-behind.
Brings-back-plenty.
White-buffalo.

The-real-hawk.
Shield-boy.
The-bear-stops.
Wears-the-feather.

Dog-eagle.
Red-horn-bull.
Low-dog.
Charging-hawk.
White-tail.
Blue-cloud (a woman).
Shield.
Kills-crows (meaning Indians of Crow tribe).
The-bear-spares-him.
White-plume.
Fears-nothing.
Red-crow.
The-last-bear.
Bird-man.
Horse-with-horns.
Fast-elk.
Chief-boy.
Spotted-elk.
Carries-the-badger.
Red-earth-woman.
Eagle-clothing.
Has-a-war-club.
Little-eagle.
Spotted-skunk.
White-bear.
White-hair.
His-fight.
Center-feathers.
Black-elk.
Lone-woman.
Deaf-woman.
Long-dog.
Iron-hawk.
Pretty-weasel.
Short-buffalo.
Bull-with-bad-heart.
Four-crows.
Tall-white-man.
Eagle-hawk.
Lone-man.
Causes-trouble-ahead.
Makes-dirt.
Black-road.
Shot-close.
Iron-crow.
Running-horse.
Little-buffalo.
Has-a-point (weapon.)
Returning-scout.
Little-killer.
Whistler.
Tongue.
Sacred-teeth.
Searching-cloud.
Female-elk-boy.
Little-owl.
Pretty-horse.
Running-eagle.
Makes-enemy.
Prairie-chicken.
Red-flute-woman.
Little-hawk.
Standing-buffalo.
Standing-bear.
Iron-white-man.
Bear-whirlwind.
Sacred-crow.
Blue-hawk.
Hard-to-kill.
Iron-boy.
Owns - an - animal - with-horns.
Blue-cloud-man.
Fingers.
Painted-rock.
Yellow-wolf.
Made-an-enemy.

The second list is that of some of the immediate followers of the famous Sioux chieftain, "Red Cloud," who figured so conspicuously in the Indian troubles in this region in Denver's early history. The circumstances under which this roster was prepared were these: At Pine Ridge agency in 1880 or 1881, the agent there, owing to some disagreement, refused to officially recognize Red Cloud as the head of the Indians then at the agency, and named another as the official chief. Red Cloud's partisans demonstrated their allegiance to him by attaching their name-pictographs, or having them attached, to a kind of protest against the agent's conduct, which was forwarded to Washington. It was prepared under Red Cloud's direction, and the name-pictographs were written on seven large sheets of ordinary manila paper. There were many other Indians at the agency, but those who joined in the protest were his loyal adherents who wanted to resent what they regarded as a slight put upon their leader. This list contains the English equivalents of the names of two hundred and eighty-eight individuals:

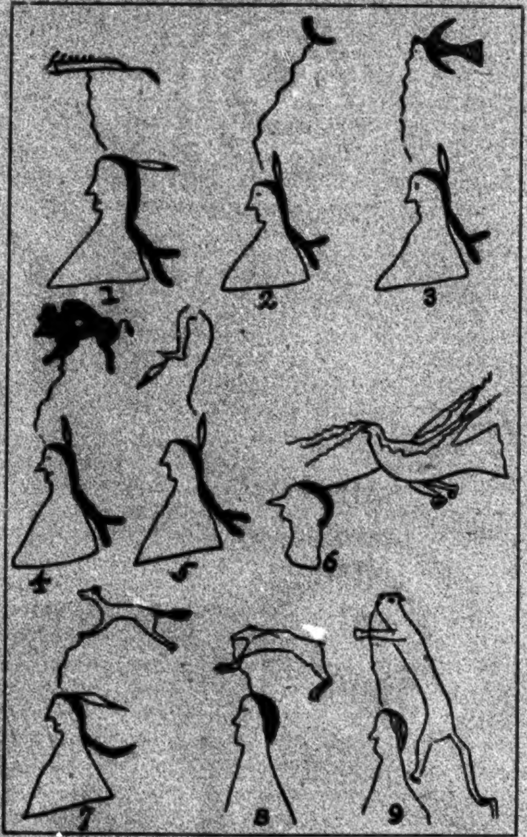
Top-man.
Slow-bear.
He-dog.
Little-chief.
Red-shirt.
White-hawk.
Big-leggings.
Cloud-shield.
Good-weasel.
Afraid-eagle.
Bear-brains.
War-bonnet.
Little-soldier.
Arapahoe.
Little-dog.
Call-for.
Short-bull.
White-bird.
Painted-face.
Iron-beaver.
Kills-in-tight-place.
Only-man.
Mad-hearted-bull.
Running-eagle.
Ring-cloud.
White-bird.
Kills-the-enemy-at-night.
Wears-the-bonnet.
War-bonnet.
Shot-in-front-the-lodge.
Kills-in-lodge.
Kills-at-night.
Runs-by-the-enemy.
Tom-belly.
Roman-nose.
Old-cloud.
High-cloud.
Bear-looks-back.
Kills-back.
Red-bear.
Poor-bear.
Runs-off-the-horse.
Bald-eagle.
Shot-at.
Leaves.
Big-voice.
Steals-horses.
Kills-by-the-camp.
Iron-hawk.
Knock - a - hole - in - the-head.
Runs-around.
Tall-white-man.
Strike-first.
Smoking-bear.
Hump.
Shot-close.
Blue-horse.
Shield-bear.
Sees-the-enemy.
Biting-bear.
Cut-through.
Red-owl.
Good-bird.
Little-ring.
Runs-off-the-horses.
Hard-ground.
Shot-at-his-horse.
Red-deer.
Yellow-fox.
Little-shell.
Gap.
Scratch-the-belly.
Singer.
Walking-bull-track.
War-eagle.
Tree-in-the-face.
Red-elk.
Only-man.
Bear-comes-out.
Poor-elk.
Blue-handle.
Bad-yellow-hair.
Red-fly.
Kills-enemy-at-night.
Flat-iron.
White-horse.
Cheyenne-butcher.
Red-eagle.
Feather-on-his-head.
Little-bear.
Spotted-horse.
Takes-the-gun.
Spotted-face.
Got-there-first.
Licks-with-his-tongue.
Old-horse.
Poor-dog.
Goes-through-the-camp.
Big-road.
Brings-lots-of-horses.
Keeps-the-bottle.
High-cloud.
Bone-necklace.
Goes-walking.
Iron-horse.
Blue-hatchet.
Blue-bird.
Good-bird.
Caught-the-enemy.
Leading.
Horned-horse.
White-whirlwind.
Red-shirt.
Bear-nostrils.
Spotted-horse.
Afraid-of-bear.
Little-bull.
Red-hawk.
Bear-paw.
Eagle-horse.
Red-beaver.
Spotted-eagle.
Fills-the-pipe.
Lodge-roll.
Red-bull.
Runs-his-horse.
Eagle-bird.
Iron-bird.
Long-panther.
Bull-lance.
Black-horse.
Poor-skunk.
Wolf-ear.
Afraid-of-elk.
Feathers.
Tall-man.
Elk-head.
Ring-owl.
Scout.
Yellow-horse.
Charge-after.
Black-bear.
Kills-the-enemy.
Wolf-stands-on-a-hill.
Eagle-bear.
Little-wolf.
Spotted-elk.

Elk-walking-with-his-voice.
Tracks.
Bob-tailed-horse.
White-elk.
Little-sun.
Owns-the-arrows.
Shot.
Red-boy.
Bear-head.
Hard.
Eagle-horse.
Standing-bear.
Small-ring.
Charging-hawk.
Afraid-of-bull.
Medicine-horse.
Two-eagles.
Shield.
Keeps-the-bottle.
Wolf-stands-on-hill.
Bear-comes-out.
Good-bull.
Fog.
Bear-that-growls.
Drags-the-rope.
White-tail.
Feathers.
Little-crow.
Black-horse.
Mouse.
Count-the-nights.
White-eagle.
Five-thunders.
White-horse.
Killed-first.
Good-bull.
Medicine.
Stone-necklace.
Bad-horn.
High-eagle.
Black-bull.
Fast-horse.
Big-turnip.
Yellow-owl.
Red-bull.
Garter.
Black-fox.
Sits-like-a-woman.
Surrounds-them.
High-bear.
Don't-turn.
Black-bird.
Weasel-bear.
Black-elk.
Takes-enemy.
Poor-bull.
Eagle-elk.
Thunder-pipe.
Horse-comes-out.
Old-Mexican.
Man-with-heart.
Little-ring.
Goes-in-front.
Little-fighter.
Mean-boy.
Red-hawk.
Kills-two.
Grasp.
Medicine.
Leaves.

Big-hand.
Gun.
Little-elk.
Little-bird.
Bear-back.
Little-back.
Buffalo-horn.
Fighting-cuss.
Horned-horse.
Enemies-hit-him.
Black-bear.
Red-war-bonnet.
Black-weasel.
Smokes-at-night.
Little-cloud.
White-bear.
Many-shells.
Yellow-knife.
Crazy-head.
Shoots-the-animal.
Kills-two.
Bad-boy.
Warrior.
Afraid-of-him.
Cloud-ring.
Kills-the-bear.
Comes-in-sight.
Bull.
Eagle-track.
Medicine-bird.
Fox.
White-bear.
Swallow.
Gun.
Ring.
Beads.
Wolf.
Black-horse.
White-horse.
Red-bear.
Little-moon.
Feather-necklace.
Fast-elk.
Black-bull.
Light.
Iron-bird.
Spotted-owl.
Don't-turn.
Red-star.
Big-voiced-eagle.
White-elk.
Porcupine.
Black-deer.
White-cow-man.
Horse- —— -the-clothing.
Stabber.
Eagle-swallow.
Afraid-of-him.
Tall-panther.
Noon.
Warrior.
Eagle-feather.
Round.
Big-thunder.
Shot-his-horse.
Red-boy.
Dog-with-good-voice.
Tall-pine.
Pipe.
Few-tails.
Medicine-man.

The adjacent illustration is a reduced copy of a group of name-pictographs of nine of these adherents of Red Cloud, the English equivalents of whose names appear in the foregoing list. Each of this group was the work of the Indian it represents, and the several are of interest in that they show methods, much elaborated and developed in comparatively recent times, of thus portraying name-totems identifying individuals.

While the foregoing lists contain only Sioux personal names, the personal nomenclature of all the plains tribes was much the same in derivation and results. The tribes west of the "divide" appear to have conceived personal names from less trivial suggestions than would seem to have been the practice of those of the plains.



Sioux Name-Pictographs.
1, Little Back; 2, Buffalo Horn; 3, Iron Bird; 4, Bull; 5, Eagle Track; 6, Medicine Bird; 7, Fox; 8, White Bear; 9, Tall Panther.

The reader will have observed that several of these names are duplicated in the lists; but each is the name of an individual, just as personal names are duplicated among white people. These appellations, or most of them, suggest their own origin. They grew out of some notable circumstance at the birth of the individual or while he was an infant; or from some achievement later in life. Red Cloud is said to have received his name from the presence of a beautiful red cloud in the west in the evening of his birthday. The sight of an animal, or a bird, or something else in nature, would lead an Indian mother to give her infant the name of the animal, or bird, or other thing, which attracted her attention soon after her deliverance. However, it will be noted that some of these names are such as would not be given an infant. "Goes-in-front," "Kills-the-bear," "Fears-nothing," "Caught-the-enemy," "Kills-the-enemy-at-night," and others of the kind were certainly acquired in mature years, and preserve the memory of brave deeds. Warriors distinguished by any unusual circumstances, or who performed valorous acts, would drop the names they had borne and construct new ones from the circumstances that had made them prominent. Sometimes names were derived from incidents not involving personal bravery, and occasionally they were based upon absurd or ridiculous adventures. A few in these lists indicate that they were bestowed in derision. But "Fighting-cuss" is undoubtedly a tribute to personal prowess, and "Keeps-the-bottle" would seem to be associated with a most provokingly selfish incident.

It has been and is yet a popular belief that the Indian race in the United States is fast disappearing, and that its total extinction is merely a question of short time. In one sense this is probably true, because it is almost certain that the Indian people will finally become assimilated by the great mass of white population, and disappear as a distinct type, just as the descendants of our foreign-born citizens blend into the dominating element of our general population. But as to the present status of the Indians, the conclusion that they have rapidly been reduced in aggregate numbers was called in question by the late Colonel Garrick Mallery, of the United States army, in a report to the Bureau of Ethnology. From the evidence he presented it appears that while many tribes have decreased, and a considerable number has become extinct, others have increased very decidedly, leading to the conclusion that the Indian population of the territory embraced in the United States, as a whole, has not greatly decreased since the earliest occupation of the country by Europeans. It is, at least, certain that the Indians have been brought under various influences which tend to preserve and prolong life. With placing them on reservations, inter-tribal wars have ceased; they are now better housed, clothed and fed; many of them have regular avocations; and they have intelligent medical attendance when sick.

The Indian population was a thin, scattered peopling of a vast country capable of supporting millions in comfort and happiness. It is doubtful whether within historic times, Colorado's ratable proportion, according to area, of the Indian people of this region, ever exceeded fifteen thousand.

The history of the Indians east of the Mississippi, from the time of the first occupation of the country by the whites, was one of forced migrations, always westward, to make room for the repeated encroachments of civilization. This was the fundamental cause for much of the aggressiveness of those whose natural habitat was west of that river, and who saw not only the intruders of their own race coming into their country, but the overwhelming wave of white encroachment following them.

The general policy of the United States government in its management of the Indian tribes of the country, was to treat with them as separate but subordinate principalities. It thus made treaties with the different tribes, purchased land from them, granted annuities to them, and so forth. Its policy, further, in recent years, was to place the tribes on reservations whence they are prohibited from wandering, and which are forbidden lands to the whites, thus isolating the Indians from the rest of mankind. This policy has been pursued until all Indian tribes are now on reservations, leaving none to roam at will over the regions they once inhabited. It has not, however, been as easy to keep the whites out as to keep the Indians in. The steady, stealthy encroachment of the dominant race has persistently reduced the area of the Indians' territorial domain; and perhaps for the better of both.

In every attempt at outlining Indian boundaries, it should be remembered that there is always more or less of overlapping of territory and a considerable area of debatable country, both in separating the groups or families, and in the lesser divisions for the tribes. There were never among the Indians any such things as clearly-defined territorial lines; they were only general. Frequently, several tribes claimed the same land, and their efforts at marking out boundaries were childishly absurd. It was often found by the United States government to be utterly impossible to decide between the conflicting claims, and not infrequently the only way to end the wrangle and avoid the difficulties lay in admitting the claims of both or all parties, and paying for the land twice or thrice for the sake of peace and harmony.

In sharp contrast with the savage side of their nature, they were like children in many ways; pleased with simple toys and trinkets, and delighted with gaudy fripperies they could use in adorning their persons. They were fond of wearing a garment or two from civilized sources. A solemn-visaged warrior clad in a white shirt, and with a cast-off tall silk hat on his head, never doubted but that he was the envy of all beholders as he strutted around in his newly-acquired finery. The braves appeared to have more childish simplicity in these ways, and much more personal vanity, than the squaws; and all the family elegancies were appropriated to the exclusive use of the head of the household.

From the earliest contact with the white man they were profoundly impressed by the mysterious potency of handwriting, and the "talking paper" mystified them for a long time. In later years they availed themselves of its service whenever they could find a white man willing to write a sort of letter of introduction or certificate of character, to be used when the bearer encountered other white men with whom he desired to establish some social standing. The confiding savage was sometimes the owner of a "talking paper" that entered further into truthful particulars than was really necessary to the purpose for which the red man desired to use it. Richardson relates that when he and Mr. Greeley were nearing Denver in 1859, at one of the stage stations a Cheyenne brave approached him and complacently presented a document, probably procured at Denver, which conveyed the following frank and interesting bit of compact information: "This Indian is a drunkard, a liar and a notorious old thief; look out for him."

In return for the lands ceded by the Indians to the United States, in addition to certain money payments, most of the tribes receive yearly allowances from the government, which are paid in the form of supplies of food, clothing, material for building, implements, arms and ammunition. The sale of spirituous liquors to them is prohibited, and the law fairly enforced; but the red man, like his white brother, can rise above the obstructions of all law when supplies of firewater are thought necessary. Under such conditions the experiment of civilizing the native races is moving along slowly; in the cases of some tribes, with success; in others, thus far, with comparative failure. However, as proper stimulus to self-support is wanting, it seems surprising that any tribe should have made perceptible advance; and the progress attained is, therefore, encouraging for future effort.

The Canadian government had far less trouble in its Indian affairs, than our own has experienced. Their system was a different and better one, and their tribes less numerous, less aggressive and, what has been of greater consequence, less crowded by white inroads. The Indian service of the United States became a large and important part of the political machine; agents and other officers were appointed by political or church influences; and places given as consolation rewards to incompetent or indifferent broken-down politicians. The government, through the operations of many of these appointees, who were charged with the duty of fulfilling its obligations, was placed in the provoking attitude of violating treaty after treaty, destroying the confidence of the Indians in the promises made them, and resulting in outbreaks, disorder and bloodshed; and, as a rule, the government was slow to punish Indian depredations.

A fruitful cause of friction and consequent trouble was the Indian's inability to define and observe boundaries. He was accustomed to going wherever he wanted to, if not prevented by a superior force; and to tell him that he must not gallop over a certain imaginary line was a sore trial to his theories of Indian liberty. Even when he described the area and confines of the territory he claimed, he did so in a loose way that gave him a wide latitude when he went abroad on the forays he loved so well.

While these people were extremely treacherous, and endowed with much craft and cunning, they almost uniformly recognized the sanctity of an ambassador. Persons on such missions might enter and leave an Indian village in safety, but the chances were that before they had gone far on their return their recent hosts would be trying to overtake and kill them.

Treaty obligations rested lightly upon them, principally through the childishness of the childish side of their nature. Placing them on reservations was the only means of preventing their annihilation. The consequences of their unrestricted contact with the civilization that came upon them here in the west so suddenly, were more than either side could stand. Their fate immediately became a choice between swift and total destruction, and a restrained life on reservations where they might attain better conditions.

It was not by violence alone at the hands of the white men, that they were menaced; they adopted with eager facility all the vices of the superior race but were reluctant in taking up the virtues. Dissipation and disease were claiming as many victims as the sword and musket, and the unhappy people were becoming more and more degraded every year. The closing decade of the nineteenth century was one of peace with all the Indian tribes, and it may with certainty be said that never again will Indian wars, that cost so much blood and treasure through the hundred years, be known anywhere in this land.

CHAPTER VI.

INDIAN TRIBES OF THE WESTERN REGION—CHARACTER AND HABITS OF THE ARAPAHOES—INDIAN DOMESTIC ARRANGEMENTS—VARIOUS OTHER TRIBES OF THE WEST—UTES AND THEIR CHIEFTAINS—PUEBLO INDIANS OF THE SOUTHWEST.

When the city of Denver was founded its site was in the very heart of the Indian-peopled region of the United States. For hundreds of miles in every direction—east, west, north, south—the native race was practically in full, undisturbed possession of the land; the hunters, traders and trappers, the advance guard of the invading people, had pursued their avocations here under the sufferance, only, of the other race, and the California emigration had passed without changing conditions in the country over which it made its way.

The Indians, sometimes peaceful, always uncertain, and often hostile to the point of open war, literally surrounded the young city with a danger which their numbers could have made overwhelming, if they had united in aggressive action. When they later attempted organized hostility the greater peril was from those to the eastward rather than from those in the west. The history of no other city in the world presents circumstances so extraordinary. New settlements in new countries are usually, always, we may say, made on the frontier. The founders of this city left the frontier far behind them, and when the first cabins were built at the mouth of Cherry creek, its distance was almost equally great in all the points of the compass.

Denver is built in the land of the Arapahoes, and preserves the memory of the tribe in the name of one of her great commercial thoroughfares, and in that of the county of which it is the seat and which stretches in a broad belt eastward to the Kansas line. The name is the Sioux word "Magpiyato," meaning "blue cloud," and was reduced to its present form by frontier English pronunciation and modification. While the Sioux bestowed this name upon these Indians, the Arapahoes' family identity is in some doubt. By a few authorities they are thought to have been of Sioux origin, but many others with stronger reasons class them among intruders in this region, and assign them to the great Algonquin family. They probably had not been in the west for many generations.

The Arapahoes were brave, warlike, cruel, treacherous, and predatory, ranging over the plains region between the North Platte and the Arkansas rivers. The site of Denver was one of their favorite camping grounds, and in the city's early days they persistently haunted the place, hanging around it in large numbers; sometimes as many as twelve hundred or fifteen hundred of them being encamped here, They soon learned that they had to behave themselves, and ordinarily were peaceable; but they were exceedingly fond of whiskey, and when under its influence became ugly customers to whom little leniency could or would be shown.

Little Raven, Head Chief of the Arapahoes.

Their personal traits and habits were degraded and offensive. Their women were habitually unchaste, and loathsome diseases were common among them. The tribe had suffered severely from small-pox which destroyed hundreds of the people. A few old individuals who had recovered from the disease afforded, in their frightfully scarred faces, ample proof of the extreme virulence of the pestilence. They accorded a very low position to their women and bestowed less consideration upon them than they gave their ponies. Parents would sell, or barter, their young daughters to white men or to other Indians for a pony or two; for a particularly likely young woman several ponies would be demanded and often received. Almost everything that could be chewed and swallowed served them as food. When they killed a buffalo, deer, or antelope they consumed all of the animal except the hide, horns and bones; the entrails were esteemed as great delicacies. The flesh of dogs was held in high favor at an Arapahoe banquet. Squaws and children would devour vermin from their own heads, which usually harbored an abundant supply.

For generations these people had been implacable enemies of the Utes, and with the assistance of the Cheyennes and some of the Sioux, made unrelenting warfare on that troublesome nation. The border settlements had occasionally received hostile Arapahoe attention, but after the founding of Denver these Indians became more tractable. They were long since removed from their old ranges, the southern bands of the tribe now having a fine reservation in the western part of the Indian Territory, while the northern bands have been similarly provided for on the reservation of the Shoshones, in the western part of Wyoming. They have not readily adapted themselves to the ways of civilization and it will probably be a long time before they do. They now number about twenty-eight hundred.

Early in the summer of 1859 there were nearly three hundred lodges of Arapahoes in and immediately around Denver and Auraria. Over in the mountains at a point about fifty miles west, an equal number of Utes were congregated. The two bands were preparing for one of their periodic encounters, and the Arapahoes had brought their lodges where the squaws and children would be under the protection the presence of the white men would afford them. While the braves were getting ready for their expedition the squaws were engaged in their usual drudgery—dressing game, cooking, curing hides, and beating the youngsters. In July the war party started, but made a fruitless errand; the Utes, having changed their minds about wanting a fight, retreating to the west before the braves from Denver reached them.

At this time the Arapahoe chieftain was "Little Raven," who seems to have been a savage of many unusual traits of character. Albert D. Richardson, author and newspaper correspondent, then on his first visit to the settlements at the mouth of Cherry creek, fell in with Little Raven, and the acquaintance ripened into a friendship which the author appears to have esteemed highly. We quote from his book—"Beyond the Mississippi"—the following account of his impressions of and interviews with this chief of the Arapahoes.

"But, one chief, the 'Little Raven,' was the nearest approximation I ever met to the Ideal Indian. He had a fine, manly form and a human, trusty face. To spend an hour in our cabin was his custom always of an afternoon; and, though his entire ignorance of English was equaled only by my utter ignorance of Arapahoe, we held pleasant communion together. Our conversations were carried on by signs and the very few words we had in common. The tongue was weak, but the gesticulations eloquent."

"Usually, by some means we could make each other comprehend; but twice or thrice we became, as actors say, hopelessly 'stuck.' Then my visitor sent for one 'Left Hand,' a linguist; for, as Day & Martin, the great blacking manufacturers, 'kept a poet,' so the chief of the Arapahoes maintained an interpreter. Left Hand spoke English fluently, having acquired it from traders in boyhood, and soon extricated us from our conversational quagmire. I will report from memory one of our interviews:"

"Little Raven enters: salutes me with a cordial grunt and a shake of the hand. I place him in the only chair our cabin affords, perching myself upon the table; fill his long pipe with Virginia tobacco, light a cigar on my own account; and then ensues a period of solemn and smoky silence. An occasional remark is ventured about the Utes, the weather, the mines; gradually we become communicative, and at last familiar. He studies one of my maps with great curiosity and attention; inquires earnestly for the whereabouts upon it of the great father at Washington; and asks other questions which show how vague stories of the wonders of civilization have thrilled his simple heart, as fabulous tales of the New World thrilled the Spaniards of old. At last he folds the map and interrogates me on personal matters:"

"Who is my lame companion [Mr. Greeley] lying upon the bunk?".

"I reply that he is a great chief and named the 'Goose Quill,' endeavoring to explain that his realm and authority are purely intellectual, but giving up in despair when the Raven interrupts me to ask how many horses he owns?"

"Where is my lodge?"

"I signify that it is by the great waters a hundred sleeps away; at which he gazes in wonder, tinged with that incredulity which civilized persons sometimes manifest for the tales of travelers."

"How many squaws and papooses have I?"

"When I have replied with due humility, he exultingly assures me that he is the happy husband of seven squaws and the proud parent of ten papooses. The comparison is odious; he evidently feels his social superiority."

"How many horses have I?"

"Sorrowfully I admit that I can lay claim to no solitary piece of horseflesh. The Raven answers by pointing triumphantly at his thirty sleek ponies grazing on the adjacent prairie. As one's wealth and position in Arapahoe eyes depend solely upon the number of his wives and horses, I feel that the Raven is becoming directly personal and inferentially abusive. So I place him in the witness-box and become questioner myself."

"How many revolvers has he?"

"He shrugs his shoulders—a pantomimic cipher. I produce Colt's new patent which he examines with great curiosity and admiration; handling it cautiously, as if it were an infernal machine, and showing a childish satisfaction not unmingled with terror, as I discharge the five barrels in rapid succession."

"How much," he ventured to ask, "did it cost?"

"I mention an almost fabulous sum and his respect for me is visibly augmented. Even the Indian is moved by the almighty dollar—or rather the almighty half dollar; for that is the only denomination of specie in which he will receive payments. I follow up my advantage:"

"How many locomotives has he?"

"A mournful shake of the head is his only response; and while I convey to him crude ideas of the fiery, untiring monster which will carry me farther in one sleep (day) than his fleetest horse can bear him in ten, he manifests intense interest, signifying that he has heard of the prodigy before, but never saw him. The impression left upon his mind that I am the individual owner of several of these monsters, I am careful not to dissipate; and thereafter he treats me with the profound deference due a 'big Injun,' and a fit associate of the Arapahoe monarch. And so, the topics of the day exhausted, with another cordial hand-shaking, he takes his departure."

Little Raven in Greeley's and Richardson's cabin.

"Left Hand" was another noted Arapahoe chieftain; and "Buffalo Billy" still another, but of lesser renown. Left Hand, referred to by Richardson, was accused by some of his people of being too much under the white men's influence, and his standing among them suffered to some extent in consequence thereof. In the troubles that came later Left Hand proved these reflections to have been wicked slanders upon his thoroughly Indian character, but he unresistingly gave up his life in the slaughter of Indians at Sand Creek in November, 1864.

The light of Buffalo Billy went out under most unhappy circumstances. One day in the summer of 1860 while he and his band were camped out on Cherry creek a few miles south-east of Denver, some of his people got hold of an unusually large supply of frontier whiskey of the deadliest quality to be found in the market of pioneer Denver—which means that it was uncommonly bad whiskey. That night a frenzied brawl broke out among the drink-crazed band, and before it ended some twenty Arapahoe braves, including Buffalo Billy, who was as drunk as any of them, had departed for the happy, and presumably soberer, hunting grounds. It was exclusively an Indian fracas with no outside responsibility for it except that which rested on the Denver men who bartered the villainous liquor.

As a tribe the Arapahoes did not rank as high as some of the other plains Indians, nor were they the equals of the Utes of the mountains. The Sioux and Cheyennes tolerated them in a patronizing kind of way, but the Arapahoes were never able to command the highest respect in Indian circles. The white people of the fur-trading period also regarded them as inferior to most of the others, and the Denver pioneers placed a still lower estimate upon them. They were brave enough when on the war-path and boastful enough when they were not; but they lacked the spirit and dash that characterized most of their red neighbors.

The Indians of these parts were neither exacting nor ambitious in their domestic arrangements. The lodge was made of several long poles standing on the ground in a circle about fifteen feet in diameter, the sticks converging at their upper ends. On these, skins and blankets would be placed, making a conical sort of structure twelve or fifteen feet high. The smoke found exit at the top where the poles came together, and from an Indian standpoint the outfit was creditable and satisfactory. When buffalo were plenty the lodge-coverings were buffalo hides dressed on both sides, and these, when comparatively new, were nearly white. This gave an Indian village when seen from a distance a rather fresh and picturesque appearance, as it gleamed in the light of the sun. The people slept on buffalo and other skins on which the hair remained. The imperfect curing of these hides made them rankly odorous, and added largely to the aroma that heralded the presence of an Indian camp, some distance to its leeward. Unless prevented by stress of weather the fire was made outside at the front of the lodge; otherwise, they brought it in where, with their robes and other unclean plunder, it made close quarters. But the family would all crowd in without much apparent discomfort.

The shield and weapons of the lord of the household were always hung in a prominent place and were the pride of his dependents as well as of himself. These with his horses were the master's evidences of wealth and importance. The shields in later years fell into disuse, but they were good defensive affairs. Made of buffalo hide and padded with hair, they would ward off a rifle ball unless struck at a right angle to the surface. They were often grotesquely decorated with paint, and usually ornamented with quills and feathers. In earlier times before the Indians depended so much on fire-arms obtained from the whites, they used powerful bows with which they often sent an arrow clear through the body of a buffalo.

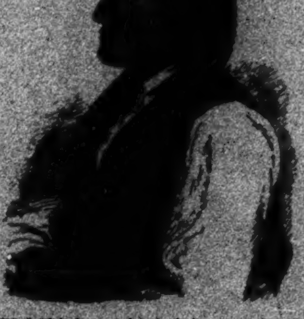
They had little mechanical ingenuity. The men held themselves aloof from physical labor except that which was necessarily involved in warfare and hunting. They considered themselves above doing anything like drudgery—all that was squaw's work. They made no pottery, and were practically destitute of artistic conceptions such as we see worked out on the handiwork of the presumably older native races. Aside from their weapons they had little or nothing that was the product of mechanical skill. Before the traders came in they depended on the skins of animals for such clothing as they used and for the coverings for their lodges. Our plains Indians had little or no knowledge of woven fabrics, until they acquired such things from the whites. Dressing the skins, as with everything else, was the work of the squaws. None of them wore much clothing. A Sioux, in answer to a white man who asked how they could get along with so little, pointed to the white man's practice of leaving his face uncovered, even in cold weather, and said an Indian was all face; meaning that all parts of the Indian's body had become inured to cold. In pleasant weather the children under four or five years old, ran around entirely naked except for the veneering of dirt that might adhere to their bodies. Older boys wore breech-clouts, and girls partly covered themselves with skins or blankets, which also constituted the clothing of the squaws. The lord and master monopolised all the family finery and elegancies, and nothing within their narrow resources was considered too good for him. But after all, dirt, squalor and foul smells were first and foremost in Indian quarters wherever they were.

The Dakota, or Sioux tribes, from the earliest knowledge of them by white men, have been the most powerful family or nation of Indians in the Mississippi valley, if not in the whole country. The warriors possessed fine physiques, great personal courage, and much craft and skill in warfare. Though these people have been backward in adopting the ways of civilization, their intellectual powers are above the average of the plains Indians. They are now on reservations in the two Dakotas, where, under better modes of living, their numbers are increasing. Including several minor bands, there are some fifteen or sixteen tribes, now aggregating nearly fifty thousand souls. This does not include any tribes that are distantly related to them. Many of them are trying to interest themselves in agriculture, but their progress is not very encouraging.

Their history from the first has been one of war; their name a terror to their Indian neighbors as well as to the whites. Their last general outbreak was that which involved the destruction of General Custer and his command on the Little Big Horn river, on June 25, 1876. In October, 1898, a party of Winnebagoes began pillaging in northern Minnesota, and killed several of the United States troops sent to suppress them, but having a much heavier loss themselves. The affair was of little significance and in no sense a tribal outbreak.

The Sioux always indignantly repudiated that name. It it a part of the word "Nadowessioux," which is the French plural of the term applied to them by their Algonquin enemies, and which meant "the hated enemy." The French traders and voyageurs abbreviated it by using the last syllable of their plural. The Indians exceedingly dislike the name, preferring the word "Dakota" which is translated as meaning "leagued or allied;" another interpretation, thought to be more precise, is "associated as comrades." The Sioux sometimes use the word "Dakota" in the sense of signifying "our friends."

The identity of the Pawnees is not clearly established. By some students they are believed to have been an independent people; others regard them as of Shoshone stock, and still others hold that they and the Caddoes constituted an independent family. In early times the Caddoes were a powerful tribe in the country of the Red river, but by war and pestilence were decimated to the mere handful now on a reservation in the Indian Territory. The Wichitas were evidently an offshoot from them and are now reduced to a fragment in the Indian Territory. The Pawnees and Wichitas were once strong and warlike enough to keep the lives of their neighbors from becoming monotonous. The Arickaras, of the north, usually associated with the Sioux and now with them on a northern reservation, are also thought to have sprung from the Caddoe stock, the four being surviving remnants of some old-time great nation of red men. By the other tribes in this vicinity the Pawnees were regarded as intruders and they were not popular with anybody. Their country, in a general sense, was along the Platte river, in the west half of Nebraska and northeastern corner of Colorado, but they roamed as far south of the Arkansas when not menaced or driven back by superior numbers of their enemies. They were always at war with the Sioux and suffered heavy losses by it. In 1874 they were removed to a reservation in the Indian Territory, where they have made gratifying progress. There are now more than two thousand of them.



Bird Chief, war chief of the Arapahoes.

It has not been determined whether the Cheyennes were an offshoot of the Sioux or of the Algonquin family; but it is probable that they were of the latter, and had not long dwelt in this part of the country. The Sioux appeared to regard them as aliens. Early in their history they occupied the country of the Cheyenne river, a tributary of the Red river of the north. The Sioux drove them out of there and they were found by the early white explorers in the vicinity of the Black Hills. Subsequently a large portion of them came southward and allied themselves with the Arapahoes. They were a large, powerful, athletic people, with a liberal allowance of intelligence, and were good hunters and fighters. They were disposed to be aggressive, and their usual occupation was that of making raids on their neighbors, and attacking white men when the latter came within reach. Twenty years or more ago, they were collected on a reservation in the western part of the Indian Territory where they have made some advancement. The tribe now numbers about four thousand, five hundred individuals. A Cheyenne chieftain of much importance and influence was "Roman Nose." In the tribal language his name was "Big Nose," but the white people substituted the other because it more accurately described the most prominent of the warrior's features. Roman Nose was a big, sullen, treacherous savage who made himself conspicuous in the hostilities that broke out a few years after the founding of Denver, and before they were over lost his life, as we shall later see.

The Crows, or Upsarokas, were a branch of the Sioux, but were regarded with great disfavor by that nation. The Crows reciprocated this sentiment, and the two became inveterate enemies. A Sioux could do no more praiseworthy act than to kill a Crow. The Crows, whether justly or not, had a bad reputation among their neighbors, who looked upon them with much disdain, and reproached them for their thievish propensities. Physically they were tall and athletic, with unusually dark complexions from which they probably derived their name. Their original range was from the southern part of Montana down into Wyoming and thence southward and eastward. They were great rovers and no part of the country for hundreds of miles around was safe from their depredations. They were considered rascally cowards by their Sioux enemies, but their reputation as marauders and horse-thieves left nothing to be desired, from a Crow standpoint. Their raids often brought them as far as Denver. Though they were usually crafty enough to avoid open war with the whites, they did not scruple to rob emigrants and settlers when opportunity offered. At present they occupy a reservation in southern Montana—a portion of their old stamping ground. They number between four thousand five hundred and five thousand, and have made some progress from their former condition. They are practically supported by the government, and many of their braves have served in the army as soldiers and scouts. In the summer of 1900 a considerable number of Crows engaged as laborers in railroad construction.

The Kansas, or Kaw, tribe was a branch of the Osages, who in turn, were of Sioux stock. The Kansas were driven out of Missouri into Kansas by the Sioux who long cherished a grudge against them. Their rovings after game and enemies frequently led them into the plains of Colorado, and often into trouble. The United States government, after shifting them around from one reservation to another, finally placed them on good lands in the Indian Territory where they have rapidly approached a civilized condition, and now number about seven hundred.

Little Robe, chief of the Cheyennes.

The Kiowas have usually been classed as a branch of the Shoshones, though some authorities have thought them a family by themselves — intruders from an unknown source. They were once located in the upper valley of the Arkansas and here on the South Platte, whence the Arapahoes and Cheyennes drove them southeast. They ranged over the valleys of the lower Arkansas and the Canadian river, frequently extending their war and hunting forays into this part of Colorado. A wild, roving people, they made a great deal of trouble for everybody around them. In 1869 the government placed them on a reservation in the Indian Territory, where they have made a little advancement. They number upward of fifteen hundred and are increasing, but their old troublesome restlessness still clings to them.

Of all the Indian tribes which once roamed over this central region of what used to be called the "Far West," the Utes are and have been the better known to the people of Denver. Some of them have become personally known here in consequence of their presence in the city as guests and most interesting figures in our festivals of the mountain and plain.

The Utes, or Utah tribes—the "Dwellers in the Mountains"—are of the great Shoshone family, and once occupied all of the mountain region in what is now Colorado, the southwestern part of Wyoming, and about as much of Utah as they cared to claim. They comprised several confederated tribes or bands, each having its chief or leader, but all acknowledging the authority of one head chieftain. They were hereditary enemies of the tribes on the plains, and before Denver was founded frequently made raids from the mountain fastness upon the Arapahoes, Cheyennes and others. Being brave, crafty, tireless, and good fighters, and usually directed by capable leaders, they caused a great deal of trouble for their eastern red neighbors. They were on terms of amity with the Apaches to their southward, and this sometimes appeared to be an offensive and defensive alliance; the two tribes visiting each other, inter-marrying, and exchanging aid and comfort in many ways.

The Utes provided material for some of the bloody chapters in the history of Colorado, but they long since realized the futility of attempting to repel the encroachments of the dominating white man. The rapid settlement of the State crowded them out of their vast domain in the mountains, limiting them to reservations which in turn were reduced in area or taken from them altogether. At each step in these proceedings the dispossessed Utes were transferred to the large Uintah reservation in northeastern Utah which had been set aside for them. It is well watered by the Green river and its tributaries, and is represented to be more acceptable to them than their old ones. These continued changes finally resulted in confining the small number of Utes left in Colorado to a reservation in the southwestern corner of the State—a long narrow strip with its length lying east and west on the border of New Mexico. But, under the terms of the old treaty which provided that reservation for the Southern Utes, the greater portion of it was thrown open in May, 1899, to settlement, and the stampede of white men usual upon such occasions, soon "took up" every available acre of the reservation.

The Colorado Ute tribes, generally classified as "White River," and "Southern Utes," now number about three thousand persons. It is probable that they never at any time in their history had a much greater number. They are very old tribes, and had dwelt in the mountain districts for as long a time as their traditions covered. In their native state they were warlike, cruel and treacherous; and they still retain some of their old practices and customs. They have not taken kindly to civilization nor to the sincere efforts to improve their condition and modes of life. A vast amount of philanthropy and money have been expended upon them. Persistent and, so far as general results prove, futile endeavors, have been made to have them engage permanently in agriculture and stock-raising. The government has furnished them with houses, horses, cattle, implements, seeds and everything else needed for the experiment, in addition to the regular annuity supplies, but the outcome has not been encouraging. A few individuals made use of the opportunities, but the tribes as a whole have not. Their unfortunate agent N. C. Meeker who, with several of his agency employees, was massacred by a band of Utes in 1879, was appointed to his fatal position, for the special purpose of enabling him to carry out a broad and philanthropical plan he had conceived for improving and civilizing the people who rose against him and slew him.

On the other hand the Utes developed two chieftains who proved to be men of unusual Indian character, and of pronounced sagacity and ability. One of these was Ouray, a man of fine physical appearance, gentle manners, great intellect, and keen perceptions. He saw early in his career the uselessness and fatal consequences of his people making war upon the whites, and his voice and influence were for peace. He was the head of the Ute nation at the time of the White river massacres, and no man, white or red, more sincerely deplored those acts of bands of Utes than he, and for which he was not only not in any way responsible, but which occurred in direct opposition to everything he had endeavored to teach his people. Ouray, who was one of the few truly noble Indians of this region, died in 1883 at the Southern Ute Agency in Colorado. A fine little city of Colorado bears his name, but his memory is otherwise preserved in the respect and esteem in which he was held by every man who knew him. He was born in 1839 in the Taos valley, New Mexico, his father having been an Ute and his mother an Apache. Some years before his death he adopted civilized modes of life, and acquired a fine ranch near Ouray.

Ouray.

The second of the pair of chieftains to whom we referred above, is Ignacio of the Weeminuche tribe of Southern Utes. He became Ouray's successor, and is a man of decided ability. Physically he is large, his height being six feet two inches, and his weight about two hundred and forty pounds. He agreed with Ouray that whatever might be the fate of his people from contact with the whites, war would only bring it quicker and make it far worse. He has been steadfast for peace and for compliance with treaty regulations. It was in consequence of his influence, justness, and force of character that his tribes finally and for good abandoned thoughts of further warfare. Ignacio exerts a fatherly control over his people and is a man of extraordinary generosity. Indian Agent Bartholomew pronounced him the best Indian he ever saw or of whom he had ever heard. His broad mind, generous impulses, ability to wisely guide and counsel, and other sterling elements of character would have made Ignacio a conspicuous, popular and useful man in any civilized community. He was born in 1844, is still living, and serving as the leader of his people.

"Captain Jack," chief of the Yampai White river Utes was a treacherous, cruel, uncompromising savage, an inveterate gambler, and in his later years a great drunkard, who resisted all attempts to improve the condition of his people. He declared that the Utes wanted none of the white man's civilization and would have none of it; and that the Ute braves would not work with the plow and hoe like squaws. It was he with his band who ambushed Major Thornburg's command, and in six days' fighting killed that officer and a large proportion of his men. This was one of the tragedies of the Ute outbreak of 1879 and coincident with the attack on the White River agency by Douglass, chief of the Uintah White River Utes, in which Agent Meeker and his unfortunate men were massacred. "Captain Jack" was killed in October, 1897, at Navajo Springs, Colorado, while on a drunken spree.

Douglass was above the average of Indian intelligence and ability, but he was crafty and insincere. Up to the time of the outbreak he professed friendship for the whites and declared that, like Ouray, he was for peace. Instantly the opportunity came for war he with twenty of his warriors attacked the agency. The massacre was attended by sickening horrors which proved that efforts to civilize the Utes had not up to that time accomplished very encouraging results. In a later chapter we will give some further account of the Meeker tragedy. Douglass died at the Uintah Agency, White Rocks, Utah, in 1885.

Another Ute chief, one who made himself offensive, conspicuous and troublesome in comparatively recent times was Colorow, a disreputable old rascal who was disliked by most of his own people and detested by every white man who knew him. When he was not trying to stir up trouble between his people and the whites, he was tramping over the country, begging, stealing, and bullying whenever he thought it safe to do so. Most of the Utes said he was really a great coward, and as a favorite scheme of his was to call at some ranch when the men were absent, and by threats of great fierceness make the women supply him with all the food he could eat, the Ute verdict was probably correct. Colorow was at the head of a small band of the White River Utes. After the massacre of Major Thornburg and a large number of his men, and of Indian Agent Meeker, the White River Utes were removed from Colorado to the Uintah reservation in Utah. Colorow never consented to the change, although he had to go, and was boastful in his declarations that he would not stay in Utah. In the summer of 1887 he and his band left the Utah reservation and came back to his old haunts where he got into trouble with the authorities of Garfield county. State troops were sent there to suppress him, which they speedily did, but at the cost of the lives of several of the Indians, two of the soldiers and one civilian; and at an expense to the State of nearly one hundred thousand dollars. This was the last conflict with Indians in the State of Colorado. Colorow died at his camp at the mouth of the White river in Utah on December 11, 1888; and his own people agreed with the opinions of the white men that it was the only praiseworthy thing he ever did.

"Buckskin Charley," of the Moache Southern Utes, would rank as a shrewd, intelligent, crafty chief without the higher qualities of Ouray and Ignacio. His father was an Apache and his mother an Ute, and he retained a good deal of the Apache character. Though of medium size he demonstrated his ability to dominate his tribe and enforce obedience to his commands. In the rumors and reports of Indian outbreaks twenty years ago the name of Buckskin Charley became familiar to the people of Denver, and his later visits to the city have placed him on many of our citizens' lists of personal acquaintances. He and some of his people participated in our last Festival of Mountain and Plain.

Buckskin Charley.

Ute morals were in many respects superior to those of the Arapahoes, especially with regard to the women. There were very few half-breed children among their progeny, and few of parentage divided with other tribes. But little fuss and bother was made over marriage ceremonies, and the least of what there was fell to the bride. The young brave having decided upon the youthful squaw he deemed desirable, gave her father a pony or two, then took the girl, and that was the end of it. Some households are polygamous, but the practice is disappearing, as others of their domestic customs are, under the influences of their present modes of life.

With the surrender of the Southern Ute reservation, passed away the last of the old order of Indian affairs in Colorado. The reservation contained about seven hundred thousand acres. The terms under which the Southern Utes surrendered it provided for three hundred and seventy-four individual Indian holdings which aggregate about sixty thousand acres of the best agricultural and grazing lands in the district. In addition to these lands in severalty the tribes receive, and are to receive "forever," a proportional share of a cash annuity of fifty thousand dollars from the government. This arrangement practically terminates the tribal existence of the Southern

Utes, and leaves the individuals to do much as they please. Many of them, will, no doubt, join their relatives on the Uintah reservation in Utah sooner or later. Their reservation town is Ignacio, where the agency headquarters are located, and it will probably continue to be the center of such of their population as may permanently keep their lands and endeavor to live after the white man's fashion.

When the reservation was thrown open there were about twelve hundred Southern Utes upon it. About seventeen hundred of their tribal kin were on the Uintah reservation, and it is among all these people that the government's annuity of fifty thousand dollars, in addition to rations, is distributed—ten thousand dollars of it being set aside for maintenance of their schools. It is not probable that the Southern Ute holders of the separate allotments will cultivate them, as they are still averse to manual labor of every kind. The lands will be rented to white men and the Ute landlords will become chronic waiters for payday. Ignacio thought the allotments too large and that smaller ones would have better served the purpose for which they were made.

With this transaction the last of the Colorado Indian tribes, as such, disappeared, and the State now has no tribes or bands of red men living within its limits under original conditions or under the general reservation system. It is difficult to realize that the entire aboriginal population of the great territory embraced within the boundaries of Colorado has been removed within forty years, and that in the vast region that had been the home of these people for so many generations, not one band, not one family, is living the old mode of life all of them loved so well.

Ignacio, Head Chief of the Utes.

The Comanches were the farthest east of any of the Shoshone tribes. They ranged over large portions of Texas, Indian Territory and eastern New Mexico. In earlier times they got into Kansas and westward to the Arkansas and South Platte rivers, but were driven out of here by the Arapahoes and Cheyennes. The Comanches were a superior, energetic tribe widely noted both in red and white society, for their skillful horsemanship, and their fondness for dashing, murderous raids on their enemies of both colors. They are now on a reservation in the Indian Territory, and number near two thousand. They have not made much advancement, but they have been only a few years under restraint.

The Apaches, of the Athabascan family of the north, have been the most pestiferous savages with which the United States government has ever had to deal. They formerly occupied a territory extending from central Texas west to the Colorado river, embracing much of New Mexico, the larger part of Arizona, and extending down into Mexico. The Lipans, a closely related people, once occupied the eastern part of the Apache territory, extending from the Comanche country southwest to the Rio Grande. They, with the Apaches, were driven out of there and moved south and southwest, the Lipans finally going over into Mexico, but retaining their alliance with their old associates. The Apaches were constantly at war with the whites, and were the last tribe to be subdued. They were murderous people, fiendish in their cruelty and ruthless in seeking vengeance. Their mode of warfare in their sterile, mountainous country, filled with hiding places inaccessible to any but their own people, made their subjection a difficult and bloody undertaking for the soldiers, who were at last successful. Their notorious leader Geronimo and some three hundred and fifty of his worst followers were made prisoners in 1886 and removed to Mt. Vernon barracks, in Alabama, to prevent them mingling with their people and renewing their atrocities. The rest of the tribe, including many small bands, were placed on various reservations, remote from each other, in the southwest. Subsequently those at Mt. Vernon barracks were removed, Geronimo and several of his chieftains being taken to St. Augustine, Florida, and confined in the old fort, "San Marco," while the others were divided around among several reservations. Geronimo is now detained at Fort Sill in the Indian Territory, and was recently reported insane. About one thousand of the Jicarilla Apaches are on a reservation in northwestern New Mexico, bordering on the Colorado line, and some four hundred are in the Indian Territory. There are now between six thousand and seven thousand of these people and they are likely to be a permanent charge upon the government, as the probabilities of ever civilizing them and making them self-supporting, are remote, indeed.

The Navajos, another branch of the Athabascan stock which is far removed from the body of the family, since first known to history had occupied a region on, and south of, the San Juan river, in northwestern New Mexico, and in northeastern Arizona; thus having been surrounded on three sides by the Apaches, and upon the north meeting the Shoshone-Ute tribes. They now have a fine reservation there in their old country in the northwest corner of New Mexico, where they are making most creditable advancement. They have considerable native civilization, not a few of them engaging in agriculture and raising stock. They possess a fair degree of art and much mechanical skill; their finely-woven blankets, beautifully patterned in bright colors, and their metal and basket work, are highly prized throughout the southwest, and bring their makers an important income. They are a fine, athletic people, excellent horsemen, and while they have been peaceful and contented for many years, they formerly frequently engaged in hostilities. At present their numbers are between eighteen and twenty thousand.

A singular people, and one without an established identity with any other of our native races, are the several tribes of pueblo Indians of New Mexico and Arizona; so called from their fixed custom of dwelling in permanent towns or pueblos. Formerly it was assumed that they were descendants of the Mexican Aztecs, but that theory is no longer entertained. More than twenty years ago J. W. Powell of the Smithsonian Institution's Bureau of Ethnology, caused a thorough research to be made of all that could be learned of the origin of these people. In an article contributed to the Denver Rocky Mountain Presbyterian, for November, 1878, he clearly set forth the wholly erroneous character of this once popular belief. Their possible relation to the ancient tribes which built the great dwellings in the canon cliffs in that general region has already been sufficiently considered so far as it is expedient to do so in this volume.

The first account we have of these people is that of De Vaca, who visited them early in the sixteenth century. Some particulars of his adventures are given in a succeeding chapter. There are a number of these tribes or communities, resembling one another very closely in their surroundings, manners, customs and traditions; and their history has been much the same. Subdued by Coronado in 1540, they made a successful revolt two years later, but were again conquered by the Spaniards, in 1586. In 1680 they made another successful revolution, and thereafter maintained a semi-independence. When the country was ceded to the United States in 1848, they were a peaceful, partly civilized people, Zuni being their principal town, as it is now. The United States courts decided that they were citizens of the United States, though they have never availed themselves of the privileges of citizenship, preferring to adhere closely to their traditional tribal or village form of government. They maintain schools, are orderly, and are making much advancement.

Their houses are communal, generally but one structure for the whole village. They are sometimes built of stone, but oftener of adobe, several stories high, each story receding from the one below, thus forming a succession of what may be called steps, or terraces. The common plan is a hollow square or a curved figure, though in some cases the form of a pyramid is followed. Some of the towns are built upon high mesas, almost inaccessible, obviously for purpose of defense in the times when they were subject to attack. In the primitive form of government retained by these Indians, each village elects its governor and council. They cultivate the soil, raise grain and vegetables for their own consumption, and keep flocks of sheep and goats. In pottery and basketry they produce a great deal of highly creditable work, much of it finding a market among the white people desiring souvenirs of this ancient race. The pueblo—or "town" Indians—now include a population exceeding ten thousand. In their religious customs there is much mysticism in which astrological beliefs and practices are conspicuous.

Perhaps the most singular of these strange people of the southwest are the Moquis, who dwell in the dreary solitudes of northeastern Arizona. They have a misty semi-civilization little affected by modern influences, as they are far isolated from any of the present routes of travel. The first accounts of them date from the expedition of Coronado in 1540. The Spaniards brought them under subjection for a time, but after the general revolt of the pueblo tribes in 1680, in which they took part, they were left alone by the invading race and have since remained an independent, noncommunicative clan believed by many, as we have heretofore stated, to be of direct descent from the ancient Cliff Dwellers. They have never shown any desire to change their mode of life, or form of government which is about the same as that of the other pueblo tribes.

They are a gentle, kind-hearted, hospitable people, cultivating little patches of soil, raising vegetables and grain and possessing small flocks of sheep and goats. They weave very fine blankets, an art that was derived from them by most of the tribes in that region. Their pottery and basketry are handsomely produced. The houses are built of stone, and for security are perched upon high places, making them difficult of access. They introduce many astrological theories into their religious beliefs, and are sun-worshipers. Referring to the sun, Masayamtiba, a Moqui Indian, said: "He diffuses warmth and nourishment for us and our animals; why should we not worship him?" Their biennial "snake dance," the chief purpose of which is to influence rainfall through the ensuing two years, is one of their peculiar, mystical ceremonies. There are now about two thousand, five hundred of these singular, exclusive people.

There are a dozen or more fading remnants of what evidently were once powerful groups of people, scattered over the region of western New Mexico and Arizona. The Acomas, Lagunans, Isletans, and so on, are examples of these isolated, meager bands of beings who drag out their lives in remote desolate localities, and who present aspects so strange that they might be taken for visitors from another planet, on which humanity develops along lines totally different from those we pride ourselves on following.

It is among all these curious folks in the southwest, that the intelligent traveler—for it takes some traveling to get to them—receives impressions that almost force him to the conclusion that he is in the presence of people, customs, and scenes which have descended from a remote antiquity; and that he sees in these survivors the remnants of a race which, in a far-off time, originated in some distant Asiatic land, and in the ages of its strength and glory established itself on this side of the world.

CHAPTER VII.

Overestimates of Indian Population—Medical Sorceries and Consequences—Indian Self-Esteem—General Character, Practices and Customs—Signs, Signals and Gesture Communication—Religious Beliefs and Rites—Superstitions, Traditions and Legends.

The passing of the Indian from the general view would appear to accord with the rather heartless doctrine of the survival of the fittest. This is an exceedingly comfortable theory for the survivor, inasmuch as he naturally concludes that he is the fittest because he finds himself surviving.

The red man was too extravagant in his use of land. He wanted several territories of prairie for his buffalo range and as much more of mountain region for his deer park. The white man stood ready to make better use of the country and to sustain as many people on an acre of the soil as the Indian could provide for on a thousand. It was a swift doom that came upon him here, as everywhere in the United States. The white man lost little time in crowding him out.

That which follows here pertains almost wholly to the true Indians—the roving hunter tribes of red men of the great plains who were removed from serious suspicion of Asiatic influences; the few references to the Utes being the exceptions.

The Indian population of the entire country was, as we have said, extremely small in proportion to the enormous territory occupied; and in times past estimates of the number were absurdly large. These estimates took lodgment in the public mind and resulted in a general belief that a very large Indian population had been displaced. This was not so. The leading cause for over-estimating the Indians' numbers came from their migratory habits within their allotted ranges. The same body of people would be seen in different places at brief intervals, and counted two or three times. Then, the imagination of the white people was allowed to go too far from the facts when considering the Indians, with respect to numbers, and in many other ways. For these and other reasons, greatly exaggerated ideas of the original red inhabitants were obtained, and the impressions so derived have been dissipated only in comparatively recent times.

Another popular misconception was that of the effect of inter-tribal wars in decimating the Indian people. It is certain that after the advent of the white man such wars prevailed to a degree far beyond that existing at an earlier time. Tribes driven from their ancestral domains often retreated to lands claimed by other tribes, and inter-tribal wars and feuds were the results. The acquisition of horses and fire-arms through the agency of white men also had great influence on Indian character. Prior to these changed conditions, the Indians were probably far more peaceful among themselves. Their accumulations of personal property were not so great as to be tempting, and their modes of warfare not excessively destructive. Armed with clubs and spears, bows and arrows, war could be prosecuted only by practically hand-to-hand conflict, and depended largely upon individual prowess; while battle for plunder, tribute and conquest was almost unknown. Such inter-tribal wars as did occur originated chiefly from other causes, such as infractions of rights relating to hunting grounds; and still oftener from prejudices growing out of their superstitions.

That which was chiefly instrumental in keeping their numbers down sprang from another and quite different source, which has sometimes been neglected. The Indians had no reasonable nor efficacious system of medicine. They believed that diseases were caused by unseen evil beings and by witchcraft; and every cough, every tooth-ache, every head-ache, every chill, every fever, every boil, and every distemper, in fact, all their ailments and physical troubles, were attributed to such causes.

Their so-called medicine-practice was a horrible system of sorcery, and to each superstition human life was sacrificed on an enormous scale. The sufferers were given over to priest-doctors to be tormented, bedeviled and destroyed; and a universal and profound belief in witchcraft made them suspicious, led to the killing of all suspected and obnoxious persons, and engendered blood-feuds on an all-pervading scale. It may be safely said that while pestilence, disease and war may have killed many, superstition killed more; in fact, a natural death in an Indian lodge was a comparatively rare phenomenon; but deaths by sorcery, medicine, or blood-feud were exceedingly common.

No being could be more patriotic or possess a larger stock of self-esteem than the Indian. He believed himself to be the result of a special creation by a partial deity, and held that his was the one favored race, and he the perfect specimen of his tribe. The names by which some tribes distinguished themselves from other tribes indicated the further conviction that as the Indian was above all created things, so in like manner each particular tribe was exalted above all others. "Men of men," is the literal translation of one name; "the only men" is that of another, and so on through the category.

Scanty as was the population compared with the vast area teeming with natural products capable of sustaining human life, the possession of land by the Indians by no means implied occupancy in the modern or civilized sense of the term. Individual ownership of land was, as a rule, a thing entirely foreign to the Indian mind and quite unknown in the culture stage to which he belonged. All land, of whatever character, or however utilized, was held in common by the tribe.

Our plains Indians were practically dependent upon natural products for their food supply, and their numbers do not seem ever to have been great enough to make serious inroads upon the quantity Nature provided, which was unfailing, and practically inexhaustible so far as savage demands upon it were concerned. However, the movements of the great herds of food animals, sometimes left the Indians on short rations. They were a strangely improvident people, and feasts and famines frequently checkered their rude existence. Agriculture was but little practiced by them, and planting was unknown among them in this region, except in a few places along the Platte and Arkansas rivers and their tributaries. To an Indian brave farming was a peculiarly irksome and distasteful business; indeed, any and every kind of manual labor was, in his estimation, positively degrading, and only to be done by squaws.

Indian boundaries being vague, elastic and uncertain, could only be defined in a general way. To determine tribal boundaries within accurately drawn lines was, in the great majority of cases, quite impossible. Perhaps earlier in their history, when they had to travel afoot, they had more permanent abiding places, and confined themselves more closely to a limited territory. But the acquisition of the horse and the possession of fire-arms wrought great changes in their habits. With the horse the Indians of the treeless plains were enabled to move over long distances with ease and celerity, which before was practically impossible; and the possession of fire-arms stimulated tribal aggressiveness to the highest pitch. The horse made wanderers of many tribes and opened the way at their pleasure to roaming over the great inviting prairies, while the guns made their conflicts much more destructive.

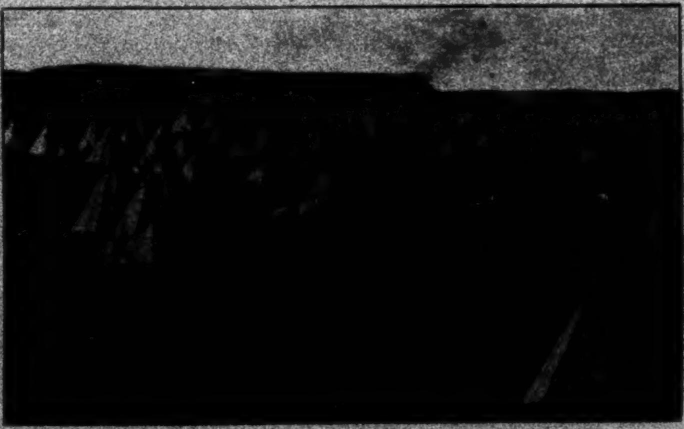
In many quarters there has been a curious tendency to overlook Indian vices and to exaggerate Indian virtues. It seems to have been forgotten that the Indian was a true savage, with all the traits and characteristics of the savage. The sympathetic willingness to exalt him even above civilized man, that has been manifested by some of those who viewed him from afar, finds little support among those who knew him by intimate and often unhappy experience.

The Indians had great physical endurance, were cruel, unrelenting foes, and with few exceptions merciless captors. In their philosophy of war craftiness and treachery were practical virtues. From the beginning of emigration they appear to have had a conviction that the white man brought with him a doom for them from which there was no escape. The coming of alien tribes to eastern Kansas and the Indian Territory, deported from regions the other side of the Mississippi, plainly foreshadowed the fate of all. Resistance might push back the evil day for a while, but it could not prevent the final advent of what seemed to them overwhelming disaster. The council and treaty orations of their chieftains were filled with pathetic prophecies of the fate the white man's presence meant, and a few brief years brought confirmation of all that had been foretold by their most gifted orators. To them their free, wild life seemed the only one worth living.

If war were not their natural occupation it certainly was a business they preferred above all others. In strife they were inconceivably cruel and fiendish. They would shockingly mutilate the dead, and prisoners in their hands usually met a dreadful fate. Men were doomed to death by torture, and their agonies were prolonged by every inhuman ingenuity. The condition of white women prisoners was one attended by circumstances even worse than death. In times of danger many frontier women carried a revolver about them as a friend that would bring death to save them from the horrors of captivity with the savages. The scalps of enemies were trophies of almost priceless value to these people. They trained their children in the refinements of cruelty, and took from them any touch of pity Nature may have been tempted to place within their young hearts. In all these manifestations of innate savagery the squaws were as destitute of humane feelings as the boastful, vain-glorious braves.

The Indian was, theoretically, a fatalist of fatalists, and actually and physically, a stoic of stoics. Death had few terrors for him, and he was practically destitute of all fear of it, in itself. He was crafty and cautious in warfare, because the glory of a tribe was to kill many enemies with the fewest losses. But, whatever his fate might be, he met it unflinchingly when it came. He avoided capture, preferring to fight to the end; but when he could no longer help himself and had to give up, he did so without bewailing his doom. It was fate. If death came to him in the excruciating agonies of mutilating tortures, or in the inconceivable torments of slowly roasting before a retarded fire, he bore his awful sufferings in silence.

The tribal government was of simple form, and the uncertain authority of the chiefs, excepting that of a great "medicine-chief," was moderately exercised. There was considerable democratic spirit among the braves, and the bonds of restraint must rest lightly if they rested at all. However, with most of them age was, by courtesy at least, presumed to carry with it great wisdom, and the old men were listened to with profound savage respect.



Indian Village.

With these people, as with all others, courage and skill followed by success in warfare, made the brave victor an idolized leader. In their savage life but two avenues to distinction were available to the enterprising and ambitious young man. One was by unusual skill and fortune as a hunter, and the other by valorous achievements on the war-path; though all able-bodied men—and there were few others—had to be both hunters and warriors from the necessities of their existence.

In their discussions and pow-wows the influence and will of the men of stronger personality usually prevailed, as they do in enlightened States and Nations. On a question of a tribe making a general war on another, there was not much difference of opinion. Such a proposition was pretty sure to be popular with everybody at any time. Petty hostile excursions, not involving the whole tribe, were frequently organized as individual military enterprises. As a rule, the Indian made common cause against the intruding and dangerous white man.

Among the Arapahoes the would-be leader of a war party did not formally invite any one to join the contemplated expedition. Any brave whose courage had been proved might become the leader of such a party. So, having duly considered the matter, he would publicly announce his intention to go on the war-path. He would fix the day for his departure and state where he would encamp the first night; naming some place not far away. On the morning of his departure he would invoke the aid of the sun, his guardian by day, and then, to propitiate him, secretly vow to undergo penance, or to offer a sacrifice upon his return. He would ride off alone, carrying his bare pipe in his hand, with the bowl carefully tied to the stem to keep it from slipping off. If the bowl should at any time fall to the ground, he considered it an evil omen, and would immediately return to his village, deferring his foray to a more auspicious time. Nothing would induce him to proceed under such a bad beginning, for he would expect sore misfortune to attend him if he did. Sometimes he tied eagle or hawk feathers to the stem of his pipe, and, repairing to the top of an adjacent hill, made an offering of them to the sun, taking them from his pipe and tying them to a pole, which he would erect in a little pile of stones he would gather up.

Those of his tribe who intended following our warlike friend usually joined him at the first camp—after he had concluded his solitary religious performances—all equipped for the enterprise; but occasionally there were some who did not join him until he had gone farther on—possibly waiting to see whether he "really meant business." The leader would eat nothing before leaving the village, nor while the sun was up; but would break his fast at his first camp, after the sun went down. The next morning he would begin another fast, to be continued until sunset again. Meanwhile, he counted his party, mounted his horse, named some other place six or seven miles ahead, where he said he would halt for a while, and again rode off alone with his pipe in his hand. After a brief tarry, his associates followed him in single file. When they reached his halting place, he told them to dismount and let their horses graze. They then seated themselves on the ground on the left of the leader, forming a semicircle, facing the sun. The leader would fill his pipe, all bowed their heads and, pointing the stem upward he would pray to the sun, asking that they might find an abundance of game, that dead-shots would be made, so that their arrows, or their ammunition would not be wasted, but reserved for their enemies; that they might easily find their enemies and kill them; and that they might be preserved from wounds and death. The leader would make his petition four times, then lighting his pipe, and, after sending a few whiffs of smoke skyward as incense to the sun, would hand the pipe to his neighbor, who smoked and passed it to the next. It was then passed from one to another, toward the left, until all had smoked, the leader refilling it as often as necessary. Then they proceeded to their next camp, where probably others joined them. This program would be repeated for three or four days before they were considered properly prepared to meet and defeat their enemies; and even with all these preliminary safeguards they often came back badly whipped.

Some of the little heaps of stones which may still be seen on elevations in the plains around here, owe their presence to this sort of Arapahoe mummery. Not all of them originated this way. Many were made by Arapahoe dreamers, who withdrew from their people for a brief season to devote themselves in solitude to contemplation, fasting and prayer—after the Indian fashion of doing those things—in order to work themselves into a state of rapture, hoping to have visions and to receive messages from spirits. Gathering stones into these little heaps was usually a part of such proceedings.

The Indians regarded the soda springs—the "Fontaines-qui-Bouille"—with superstitious awe and reverence, believing that a spirit troubled the waters and caused the bubbling by breathing in them. Before going on war expeditions, it was one of the preparatory practices of the Arapahoes to propitiate the spirit of the springs by throwing beads and knives into the water, and hanging other gifts, such as deer-skins, quivers and the like, upon the branches of the adjacent trees.

A great many years ago, according to an Arapahoe tradition, the Navajos possessed a little stone image that was the most extraordinary "medicine" ever heard of in Indian annals. It not only brought success in war and hunting, but even made members of the tribe possessing it, impregnable to the assaults of the grim reaper at all times and in all ages of life. The Utes heard of it, coveted it, of course, and made war upon the Navajos and captured it. The Arapahoes, having long known of it, also desired to possess it. When the Utes got back from their successful expedition our Arapahoe friends decided that their time had come to secure the priceless "medicine." So, they made war on the Utes, whipped them to be sure—as this is an Arapahoe story—and carried off the charmful little stone god. But the warrior to whose keeping it was confided now felt himself too great a man to associate with his homeward-bound companions, and kept off to himself. While doing so he was overtaken by pursuing Utes, hopeful that they might yet recover their potent image, whereupon both he and the "medicine" suddenly vanished into the air and were seen no more by mortal man. The terrified party of Utes fled to their tribe and related the circumstances of the disappearance of the "medicine" and the warrior foe who had it in keeping, and thence the strange tale spread through Indian society in all this region. According to Arapahoe lore their valorous capture and even brief possession of it, with the fact that it left the world taking one of their chosen tribe with it, made them forever after the greatest people of the earth in "medicine," war, hunting, and all other desirable Indian attributes; a belief no Arapahoe ever doubted.

Stones had some mystical significance to nearly all of the plains Indians. A Sioux would pick up a roundish stone of any kind, or color, paint it, and go a few rods from his lodge, clear away the grass from a space from one to two feet in diameter, and there place his stone; or god, as he would regard it for the occasion. He would then make it an offering of some tobacco and a few feathers, and in his way pray to the stone to deliver him from some danger of which he probably dreamed, or else imagined.

"Buffalo Medicine."

Many of them considered a man's shadow as associated wth his spirit or life, and would reproach a sick person for what they considered imprudent exposure in convalescence, telling him that his shadow was not yet well settled down in him.

Nearly all of them believed, the Sioux especially, that by eating the heart of a conspicuously brave man, particularly if he were an enemy, they would add all of the dead man's intrepid fearlessness to their own stock of courage. It is related that the body of Captain Thomas Custer, who was killed in the massacre on the Little Big Horn river in 1876, was opened, his heart removed and thus disposed of by the Sioux victors in that dreadful affair. These tribes would also eat the liver of an unusually intelligent dog in order to become endowed with the animal's keenness, sagacity and courage.

When first known to the whites, the Pawnees made a human sacrifice to the "Spirit of Corn"—a practice, with some changes in procedure, too often followed by our own people in our own times. The victim, a young woman, was first tortured by being suspended over a fire. At a given signal a hundred arrows were let fly, and her whole body was pierced. These were immediately withdrawn, and her flesh cut from her bones in small pieces, which were put into baskets, and carried into the cornfield, where the grain was being planted, and some of the blood squeezed out on each hill.

Early in their history the Cheyennes in emergencies would cut off an arm as a sacrifice to the spirits, accompanying the ceremony with special appeals for favor and co-operation. By a gesture sign indicating this dismemberment, the Cheyennes were referred to by their neighbors. They also wore necklaces made of the dried fingers of their enemies as reminders to the spirits of their prowess and worthiness.

Many of the tribes poisoned their arrows by sticking the heads in the decomposing body of a man or an animal, preferably that of a man, because of the assumed greater virulence of the poison. Or, they would capture alive a rattlesnake and after pinning it to the ground, tease it to repeatedly bite a bit of raw meat, usually a piece of liver, thus saturating it with poison. Into this inoculated substance they would stick the tips of their arrows, and withdraw them coated with a virus usually fatal to the wounded enemy.

All of them had curious methods of leaving messages or conveying information by signs, to those who followed them. The following account of an example of this is taken from James' narrative of Long's expedition to the Rocky Mountains in 1820:

> ["At a little distance (on the bank of the Platte river) in front of the entrance of this breastwork, was a semi-circular row of sixteen bison skulls, with their noses pointing down the river. Near the center of the circle which this row would describe, if continued, was another skull marked with a number of red lines. Our interpreter informed us that this arrangement of skulls and other marks here discovered, were designed to communicate the following information, namely: that the camp had been occupied by a war party of the Skeeree, or Pawnee Loup Indians, who had lately come from an excursion against the Cumancias (Comanches), Ietons (another name for the Comanches) or some of the western tribes. The number of red lines traced on the painted skull indicated the number of the party to have been thirty-six; the position in which the skulls were placed, that they were on their return to their own country. Two small rods stuck in the ground, with a few hairs tied in two parcels to the end of each, signified that four scalps had been taken."]

A sapling cut off about three feet from the ground, the bark peeled from the stump, on top of which a stone was placed, signified danger. A tomahawk left sticking in the trunk of a tree, meant war, attack, revenge. A tomahawk or knife driven in the ground made formal declaration of war.

By racing their horses or ponies this way and that, or in circles, and the like, they could convey a great variety of information to distant associates.

Their sign language was a wonderful thing. They could relate long stories with but a few spoken words or grunts. All Indian languages were so imperfect that even when two members of the same tribe conversed, half the intercourse was carried on by signs. Still, by a motion or a grimace mirth could be excited or violent anger aroused. To the inexperienced white man it all seemed a hopeless tangle of swift gestures, contortions and other movements, but the mature brave would grasp the meaning as fast as his informant could make the signs. In these, the hands were chiefly instrumental; but the eyes, mouth, head, and every feature and part of the body would be utilized, and surrounding objects brought in, to suggest parts of the story told in all the quick and complicated movements. It is not surprising that the Indian was a silent man, when he could convey so many thoughts with little or no vocal utterance.

After they obtained the cheap pocket-mirrors found in the stocks of nearly every trader, they became surprisingly proficient in using them for signaling by flashes of light; up and down, right and left, and so on, they made a great variety of combinations. They communicated with each other over long distances in this way, the Sioux tribes becoming masters of the art.

Signaling by smoke was another practice. Making a heavy smudge, they confined the smoke under a blanket, and suddenly releasing it, would send it up in puffs or rolls to which a special meaning attached. At night, burning arrows were used, but with great caution in times of war, as they advised enemies as well as friends.

A war-party coming upon the encamped enemy at night, would send a spy to ascertain the number of lodges. This worthy would creep, or rather, wriggle, up to where he could count the lodges, and turning around so as to face his watching friends, he would draw his blanket up on his head, leaving an opening over his face and breast where, in this shelter of his blanket, he would strike off with flint and steel, one spark for each lodge in the enemy's camp.

Among many of the plains tribes the custom was to buy the eldest of the daughters in a promising and desirable family, by which the matrimonially inclined purchaser would obtain title to all the other daughters, and would add them to his polygamous household as he thought he needed them. In the native state the Indian was below the passion of love. It was practically unknown among them, and they had in their vocabularies neither word nor phrase expressing affection, fondness nor endearment. While these sentiments were unknown in both their thoughts and their speech, they found reasons for savage pride in their male offspring who early manifested a cruel, warlike disposition, and an aptitude for hunting; the chief attributes in Indian character worth considering and cultivating. Female children were regarded with the utmost disfavor, and when they reached womanhood became the toiling, drudging slaves of their boastful, brutal consorts. In most of the tribes the parents of the wife would not hold any direct communication with their son-in-law, but would call in a third person if they had anything to say to their daughter's lord. The reasons for this queer custom are unknown.

The pangs of maternity bore lightly on the Indian mother. The birth of a child to those hardy, storm-beaten and otherwise maltreated creatures, barely interrupted the daily routine of their lives, and was attended by little inconvenience to themselves or their associates. Usually a child was not weaned until its successor had to be provided for.

They possessed the rude outlines of a religion in which appeared a vague faith in a Great Spirit, which ruled over the world and all it contains; but it was swaddled in a mass of ridiculous superstitions. They expected a future life in happy hunting grounds, which would be in most respects a continuation of the one they lived here on earth, with some of the harsh conditions left out, and many new and more favorable ones brought in. They had no theory of a hell, of a place or state of future punishment. In their lexicon of Indian character there were no bad Indians, from an abstract theological point of view; therefore such a state or place were wholly superfluous. They never consigned even their worst red enemies to "the bad place." The happy hunting grounds were open for all and large enough for everybody.

Their languages contained no words such as we classify as profanity, or "swearing," and they were much surprised in early times when they learned the purport of such words and that the white men had the temerity to employ them in connection with the name of the Great Spirit.

Their appeals and petitions addressed to the unseen powers were solely with a view of procuring coveted temporal benefits, and not for any welfare held off in the future. The Indian was a firm believer in the present—in the to-day. He regarded his immediate necessities as of far greater importance than his prospective needs and comforts in some later period. He had little conception of the soul's survival in a purely spiritual form; his future existence was to be a physical one, and his rude theology centered upon that expectation. Therefore, an outfit of weapons and a temporary supply of food were left with the dead.

Upon the death of a brave grief was manifested by wails and howls from the squaws, and the beating of drums and use of other noisy instruments by the men; all of which continued for several days. Much less fuss was made over the death of a squaw; and sometimes none at all.

Our Indians had a varied array of superstitious and mystic lore. The behavior of familiar creatures around them was carefully observed for ominous indications. Thus, they would abandon for the day any important undertaking if a snake wriggled across in front of them at their outset, or if birds were seen flying in certain directions which were thought to forebode a bad result for the enterprise in hand.

They believed sickness was caused by an evil spirit entering the invalid. Spirits of animals were much feared and their departure out of the sick person's body was a cause for thanksgiving. Even in trivial ailments the bad spirit was recognized. Thus, an Indian after an eructation would say what was equivalent to "thank you, animal."

In a case of sickness in which the savage household thought it unnecessary to "send for the doctor," the squaw and several of her squaw friends would undertake to drive the evil spirit out of the patient by howling over him. A squad of them would make the most diabolical uproar of screams, yells and howls. If, after keeping this up until they were exhausted, there was no change for the better, they would conclude that they were dealing with an uncommonly bad spirit, and send for a "medicine-man," whose treatment soon killed or cured—usually the former; for an Indian down with a serious affliction had few chances for recovery after his doctor got hold of him.

Most of them believed the barking of a fox ominous of evil to come. The Kickapoos had a legend to the effect that their ancestors had tails which were taken from them in some mysterious way. After this misfortune, the impudent and crafty fox tantalized them by sending a messenger every morning with mock messages of sympathy, and to ask how they were getting along without tails. This hints at the dog-like apes which existed in these parts long before man is assumed to have appeared.

The plains Indians believed in the existence of fairies in the mountains. The tribes of Sioux stock or association described them as "the little people," eighteen inches high, with very large heads, and armed with such effective bows and arrows that they could surely kill any one who approached their abode. The Arapahoes claimed to have seen these dangerous little folks come out to the foot-hills.

The Shoshone bands peopled the Rocky Mountains with little imps, which they called "Nirumbees." These were represented to be about two feet tall, destitute of clothing, and equipped with tails. They stole the children of the Indians and left instead the young of their own baneful race who resembled the stolen children so much that the Indian mothers were deceived into suckling the youthful substitutes; whereupon the maternal founts were withered and the stricken mother died.

All of the tribes which frequented the plains along the eastern base of the mountains believed that Pike's Peak was the favorite meeting place of these little mountain people, who were joined on its summit by fairies and elves twice a year—in the spring and in the autumn—in councils and various ceremonies peculiar to such mysterious and fateful beings. To disturb these gatherings, or even to draw very near the foot of the mountain while the little people were assembled on its summit, was held to be a most dangerous personal indiscretion, and fatal to the potency of the offender's "medicine," even if he escaped great bodily harm.

The "medicine chief" was the great man of his tribe, and few individuals dared to cross him, even in trivial affairs. He was the Indian autocrat. When he went into battle he courted the thick of danger, if for no other reason than to show his people his immunity from injury in places of the greatest peril.

Medicine Man.

Among nearly all these rude people "making medicine" was, under some circumstances, a purely spiritual performance to win the approval and assistance of the mystic powers; while at other times it was intended to be an application of the healing art. During the battle of the Little Big Horn river in 1876, where General Custer and his command were destroyed, Sitting Bull, the leader of the Indians, remained in his tepee "making medicine" for the success of his people in the bloody combat.

The "medicine" men of many tribes believed in copiously bleeding the sick so as to afford inviting opportunity for the evil spirits to come out with the blood—a practice formerly in great favor with civilized white medicine men and, probably, with no sounder reasons back of it than those advanced by the savage practitioners.

Every brave carried on his person a little sachet containing his private "medicine" or charm to protect him from disease and danger. Often the "medicine" was a bunch of herbs, sometimes an unusually shaped or colored stone, an animal's tooth, or any one of a variety of objects he might deem suitable for the purpose. If bad luck came to him he would conclude that he was carrying the wrong kind of "medicine," and would change it, and keep on changing it, until he found the charm intended by the Great Spirit for his particular case, when all would go well. Any great or unusual thing had a "medicine" significance to them.

Most of the tribes indicated lapses of time by conspicuous natural divisions: thus, "five snows" meant five years; "one moon" a month; "half-moon" a half-month; "one sun" or "one sleep" a day.

The sun dance of the Sioux tribes was a most peculiar ceremony that involved self-inflicted tortures of extreme severity. A tall, strong pole would be set firmly erect in the ground; to the top of this were attached long thongs of rawhide reaching near to the ground. On each side of the breasts of the devotees two parallel slashes were cut about two inches apart; the strips of skin thus outlined, together with some of the underlying muscles, would be undercut with a knife, and through each of these quivering, strap-like handles of living flesh one of the rawhide thongs would be passed and tied. Then these young braves would begin to dance around the pole, surging backward, twisting this way and that, swinging themselves off their feet and otherwise struggling until the cruel thongs had torn their way through the muscles and skin, and they fell back exhausted by their agonizing sufferings. These were undergone in silence in presence of the assembled tribe, which regarded the ceremony as the most important one of the year. It was accompanied by weird chantings and outcries by the spectators, and a monotonous beating of rude drums. Only the young men participated in the active parts of the ceremony, squaws being debarred from such dignities. Sometimes the incisions were made on the back instead of the breast, but the latter was the preferable practice, as it afforded a more conspicuous place for the honorable scars of the mutilation to display themselves, and to be pointed to with pride by their possessor. The young brave could not rank as a full-fledged warrior until he had passed through this dreadful ordeal.

The Sioux have another singular ceremony which has been called by the white people the "ghost-dance." This term, however, does not convey the exact meaning it has for the Indian. Ghost-dancing was done when a tribe was growing restless and inclined to hostilities, if portents and circumstances could be made to seem favorable. So the ghost-dance was intended to invite and establish advisory communings with their ancestors, to arouse slumbering memories in the tribe, to revive old grievances, and to stir up the war-like spirit of the people. These ceremonies in recent years were stimulated by reports that certain eminent "medicine men" had received communications from the Great Spirit saying that all the white people were to be driven out of the country, the land was to be restocked with buffalo and other game, and the good old Indian days were to be brought back again in all their savage freedom.

The Sioux have a tradition that they first acquired fire through the efforts of a friendly and obliging panther which, in scrambling up the face of a ledge of rocks, struck sparks from the stones with his claws; their agile ancestors secured these sparks and from them kindled the first Sioux campfires. All the Indians appear to have long known and practiced the method of obtaining fire by subjecting dry wood to friction.

The Indians always when possible carried their dead and wounded from the field of battle. Two warriors, each on a fleet horse, would gallop to an injured or dead comrade, and without checking their speed, pick him up, swing him across one of the horses, with marvelous skill, and make off with him.

They believed that a scalped white man was thereby annihilated and could not possibly have a future life; therefore, he would never turn up in the happy hunting grounds to bedevil them there as he had here on earth. By some tribes a scalped Indian was believed to be debarred from the happy hunting grounds, but most of them thought that he would be subject to great disadvantages but would not be wholly deprived of a share in the joys of the hereafter. They would brave the greatest dangers to procure the scalp of a white enemy, whose eternal destruction could thus only be assured.

The Utes in their mountain fastnesses disposed of their dead by concealing them in secret places, endeavoring to leave no visible sign of their sepulture. Sometimes they would hide the bodies in caverns and recesses in the mountains. In consequence of these practices a dead Ute, or an Ute burial place, was rarely seen. They objected to talking about their dead.

R. L. Wooton, a noted frontiersman, relates in his published reminiscences that all the Ute tribes had the singular and inhospitable custom of killing the first stranger, red or white, who entered any of their villages after the death of a local chieftain. They did this in order that the spirit of the departed leader might not be alone on his journey to the unknown country.

Kit Carson who, as Indian Agent had charge of the Utes from 1854 to 1859, in one of his official reports gave the following version of this curious custom among them:

"It is customary among the Utahs when one of their number is slain, or even dies a natural death, for them to kill one or more persons of another nation as payment for the loss of the deceased. The number killed depends entire on the position held before death by the Utah. I have known as many as four Mexicans to be killed for the loss of one warrior who died of disease."

The Arapahoes, Cheyennes and most of the other plains tribes, deposited their dead in trees, when they could find them within reach. The body was wrapped in the dead person's blanket with a supply of tobacco, a little food, and a suitable outfit of weapons, or utensils if a squaw, the whole rolled and tied up in a buffalo robe, and placed on the heavier branches of a cottonwood where it remained only until decay and the winds caused it to fall to the ground, where the wolves quickly made final disposition of it, leaving the bare bones strewn around.

All Indians dreaded death by suffocation, because of their belief that at death the spirit passes from the body by the way of the mouth. If egress be obstructed the soul is embarrassed, and might be long delayed in getting out of the body, with a possibility that it would never escape. This was why they regarded death by hanging with such extreme aversion. They also believed the spirit of an Indian killed in the darkness was seriously put to it to know what to do or which way to go, and might never be able to find its way to the land of promise. While an Indian never hesitated to kill an enemy in the dark, he wanted sunlight around when his own end came.

Like all superstitious peoples they were inveterate gamblers—every one of them. They took naturally to the domain of chance, and after intercourse with the whites adopted all of the simpler methods of winning and losing their paltry belongings. Horse-racing was very popular with them, and their ridiculous confidence in themselves and in everything they owned, often left them stripped of all their possessions and utterly bankrupt, at the end of a speed-trial with white men's horses.

One of their many absurd superstitions provided for a permanent and unfailing supply of buffalo. Of this, William F. Cody ("Buffalo Bill") says:

"Every plains Indian firmly believed that the buffalo were produced in countless numbers in a country under ground; that every spring the surplus swarmed, like bees from a hive, out of the immense cave-like openings in the region of the Llano Estacado, or Staked Plain of Texas. In 1869 Stone Calf, a celebrated chief, assured me that he knew exactly where the caves were, though he had never seen them; that the good God had provided this means for the constant supply of food for the Indian, and however recklessly the white men might slaughter, they could never exterminate them."

Stone Calf soon learned how sadly he was mistaken in his estimate of the white man's abilities as an exterminator.

They believed the buffalo to be susceptible to the charms of their "medicine." They would make a rude pedestal of stones, three or four feet high, and on this place two or three buffalo skulls. If stones were not available for the pedestal, it would be made of bones or sticks of wood. In both learned and unlearned circles of Indian society, this monumental type of "buffalo medicine" was held to possess great potency in influencing the animals to draw near and await further Indian attentions.

They had a curious and complicated system of totems. A family totem was the coat-of-arms of the family or clan to which the individual belonged. A tribe embraced a number of such families or clans. In choosing a help-meet the brave must find her in another family or clan of his tribe; not in his own subdivision where the individuals were supposed to be more or less blood related. But, as a matter of fact, they did not actually know much about their standing as blood relations. There were also tribal or national totems. Thus a Sioux might have three coats-of-arms—that of his family or clan, of his tribe, and of the great Dakota nation. Totems had no connections with "medicine," necessarily, nor with the "medicine" sachets of the individual; nor had they essentially any religious significance.

The tribes of the Sioux family appear to have maintained an organization which may be called a secret society. It was associated with their rude religious beliefs, and also with their medical theories.

Nearly all of the plains Indians had a sort of fantastic mythology in which legendary theories of their origin were obscurely interwoven. The Indians of the Kansas tribe introduced mythical personages in one of their tales, in which they stated that the ancestors of these mystic individuals were birds which descended from an upper world. This story was probably borrowed from their kinsmen, the Osages, who claimed that when their ancestors came to this earth they alighted on a sycamore tree, because all of the land was under water. When the water abated they came down and occupied the country. The Kansas Indians' antiquarians included an account of the prevailing water and asserted that it was dried up by their progenitors blowing upon it. They also stated that those worthy persons caused the growth of vegetation after the water was gone.

All the tribes of the Sioux stock believed that their ancestors were entitled to the credit for removal of the water, and pointed out that it was altogether too big an undertaking for any people except their own. Furthermore, their antiquity was much greater than that of everybody else. It is characteristic of the Sioux, as it is with many of our practical politicians, to claim everything.

The Crows had a somewhat similar story embellished by the great deeds of their ancestors in dealing with the surplus water and making the country habitable. But it is suspected that they acquired it in the way they possessed themselves of much of the other property of their neighbors—without the consent of the owner.

The Sioux tribes through all their ramifications were believers in the appearance from time to time of a huge animal that was the devouring enemy of the red man. This monstrous beast was represented to be capable of swallowing whole a full-grown Indian; and very fond of doing so. No one living had ever seen him, but his appearance was constantly held in apprehensive dread. This superstition may have been suggested by the bones of the mastodon which are abundant all through this region, or by the fossil remains of the ancient bison which had horns spreading ten feet from tip to tip, or by those of other huge creatures once abiding here in the west.

A well-authenticated account of an Indian legend of the origin of the red people, which shows no trace of the white man's influence, is found in the report of Lewis and Clark's exploring expedition made nearly a hundred years ago. It is that of the Mandans, a branch of the Sioux. While it is destitute of any meaning that could possibly be rendered intelligible, it contains an amusing variation of the ancient and widespread story of woman having brought trouble into the world. Lewis and Clarke say:

> "Their belief in a future state is connected with this theory of their origin: The whole nation resided in one large village, underground, near a subterranean lake. A grape-vine extended its roots down to their habitation, and gave them a view of the light. Some of the most adventurous climbed up the vine, and were delighted with the sight of the earth, which they found covered with buffalo, and rich with every kind of fruit. Returning with the grapes they had gathered, their countrymen were so pleased with the taste of them that the whole nation resolved to leave their dull residence for the charms of the upper region. Men, women and children ascended by means of the vine, but, when about half the nation had reached the surface of the earth, a corpulent woman, who was clambering up the vine, broke it with her weight, and closed upon herself and the rest of the nation the light of the sun."

The Indians to the eastward of the upper Mississippi originated this curious tradition which later spread among the tribes farther west:

> "In former times the father of the Indian tribes dwelt toward the rising sun. Having been warned in a dream that a deluge was coming upon the earth, he built a raft, on which he saved himself, with his family and all the animals. He floated thus for several months. The animals, who at that time spoke, loudly complained and murmured against him. At last a new earth appeared on which he

landed with all the animals, who from that time lost the power of speech, as a punishment for their murmurs against their deliverer."

Among the Arapahoes and Cheyennes there was a deluge legend which landed the ark here near Denver, a circumstance which indicates some revision of the original story, as both tribes were probably intruders in this part of the country from a period not a great many generations remote. However, their tale was to the effect that when their ancestors found a landing place for their big canoe on a mountain eminence near Palmer Lake, and got the various animals they had undertaken to save from the all-pervading freshet, safely on the ground again, the men went to look over the country, leaving the disembarked menagerie in charge of the squaws. The animals becoming hungry and restive made the women so much trouble that they got angry, and with brandished sticks and waving blankets attempted to make the unruly creatures behave. But instead of this, the animals were so badly frightened by the fearless and menacing squaws, that they all turned tail and fled. From that time they have so feared mankind that they have remained wild and must be hunted by all who want any of them for food or other purposes; a consequence much deplored by the braves, and by them held to be sufficient cause for their general bad opinion of womankind, and for the harsh treatment they bestow upon their squaws. It is, furthermore, the only instance in Indian traditional lore wherein the virtue of even a little courage is accorded to women; that being an endowment usually considered possible only to their lords and masters.

Disposition of the Dead.

A large portion of the plains Indians believed that in the beginning the world was created by the raven, which dark bird was associated with many of their fancies. Dean, in his interesting work, "The Raven in the Mythology of North-Western America," says: "Ask any of the Indians 'who made the world and all things therein' and the answer will be 'the raven.'"

Boudinot relates the following story told by a clergyman who visited the Indians northwest of the Ohio river in 1764, and there met other Indians who had come from west of the Mississippi:

> "They informed him that one of their most ancient traditions was that a great while ago, they had a common father, who lived toward the rising of the sun, and governed the whole world; that all the white people's heads were under his feet; that he had twelve sons, by whom he administered the government; that the twelve sons behaved very bad, and tyrannized over the people, abusing their power; that the Great Spirit becoming angry with them, suffered the white people to introduce spirituous liquor among them, and by this means usurped power over them, and ever since the Indians' heads were under the white people's feet."

The introduction of the white man and his firewater in this tale removes the presumption of its antiquity as a tradition among them. When the Indian came in contact with the white man's whiskey he met an enemy that was more than a match for him under every condition. In periods of peace the bottle refused to recognize the armistice, and in times of war when it fell prisoner to the ransacking red man, it was by no means a helpless captive. Its work was as effective at one stage as at the other, and always moved forward on the path of destruction with the undeviating progress of Time itself. Their "medicine" men could make no "medicine" that would arrest its ravages, and the spirits whose aid they so often invoked in savage enterprises could do nothing to prevent this demon laying low the flower of the tribes; and about all the rest, for that matter. Its career among the red men afforded us the only example of obedience by those people to the injunction laid upon all of us to love our enemies.

The Indians of the west came into contact with white men, directly or indirectly, much longer ago than we are accustomed to considering. The Spanish expedition into this region, under Coronado, came up from the south more than three hundred and fifty years ago; while the early French Jesuit explorers, who pushed westward by way of the great lakes, reached the upper Mississippi much more than two hundred years ago. So, it is not improbable that the white man's influence had something to do with at least part of the coloring of the Indians' speculative lore and consequent practices. It is not difficult to understand how it may have been so, or that new versions of old theories and legends, based on the accepted wisdom of the seemingly supernatural strangers, would spread from tribe to tribe. But many of the stories are unquestionably original. The deluge tradition being almost universal among the races of the earth, it is more than probable that our Indians had their own versions of that most disastrous rainfall.

CHAPTER VIII.

SPANISH DOMINION IN THE SOUTHWEST—GUZMAN'S ATTEMPTED EXPLORATION OF NEW MEXICO—REMARKABLE ADVENTURES OF CABEZA DE VACA—DE NIZA'S ADVANCE TO THE PUEBLO COUNTRY—EXPEDITION OF CORONADO—HIS LONG AND FRUITLESS SEARCH FOR THE MYTHICAL CITY OF "QUIVIRA"—OBSCURITY AND CONFUSION IN SPANISH ACCOUNTS OF THE EXPEDITION AND OF QUIVIRA.

Until a comparatively recent period all American historical accounts of Europeans visiting our southwest country, contained nothing that antedated the expedition of Coronado, and that of Moscoso who succeeded in command of De Soto's intrepid company of adventurers after the death of that daring leader; and the enterprises of these explorers, practically contemporaneous, had been considered as the pioneer invasions of the region by white men.

In 1851, Buckingham Smith, Secretary of the American Legation at Madrid, and a deeply-interested student of the history of Spanish dominion in America, discovered in the government archives at the Spanish capital the "Narrative of Alvar Nunes Cabeza De Vaca," an old, remarkable, but forgotten story of Spanish adventure, daring and suffering in our southwest, that had lain unnoticed by Spanish and unknown by American scholars for more than three hundred years. Smith translated it, found it of exceeding interest and value, but obscure in many details, especially as to latitudes and localities, that would now be historically important.

Soon after Cortez penetrated the interior of Mexico, he heard traditions of a country far to the north which was said to be thickly peopled, and ruled by powerful Amazons. These reports were embellished by many fancies and, of course, attributed great riches to the fabulous nation. The stories came to the ears of Nuno De Guzman who was then at the head of Spanish affairs in western Mexico, with his capitol at Culiacan. They were emphasized in 1530 by a Tejos Indian slave who told Guzman that far in the country to the northeast he had seen seven cities as large and fine as the city of Mexico, in which gold and silver were abundant, and that many of the inhabitants were workers in those metals. The Indian represented that he had been with his father, who was a trader, several times to the cities and, notwithstanding that they were far away beyond a very bad country, he could guide an expedition to them.

There was at this time a kind of jealous rivalry between Cortez and Guzman, and the latter being very anxious to exploit himself for the good it would do him in the Spanish Court at home, decided that he would try to find those treasure-burdened cities of the north. So, with a force which the old accounts say consisted of from four hundred to five hundred Spaniards, and from ten thousand to twenty thousand Indian allies, he paraded forth on his mission, with the Tejos Indian slave for a guide. Bad management, division of authority and incoherence of purpose made the expedition a failure, and Guzman soon returned, empty-handed, not having been able to get farther away than Colombo and, therefore, not out of the present bounds of Mexico. This is the last we hear of Guzman as an explorer. After his service as Governor at Culiacan for eight years, the new Viceroy Antonio De Mendoza, superseded him with Francisco Vasquez De Coronado, a young man of high character and much ability.

Viceroy Mendoza, also a man of force and ability, was anxious to extend the domain of New Spain as far as possible, and to that end was willing to encourage northward explorations. At this opportune time Alvar Nunez Cabeza De Vaca appeared with most extraordinary tales of hardship and adventure which aroused Spanish curiosity, stimulated Spanish imagination to the highest pitch, and started explorations northward, as we shall see, after we give some attention to De Vaca's remarkable experiences.

In 1528, an expedition under Pamphilo De Narvaez sailed from Cuba for Florida. It comprised four ships, about four hundred men, and a large number of horses, together with supplies and equipment for an extended exploration of all the country bordering on the northerly coast of the Gulf of Mexico, of which but little had been learned by preceding Spanish adventurers.

De Narvaez put in to Tampa Bay, and with a part of his followers landed and started into the interior. The arrangement was that the vessels should go northward along the coast and wait in some harbor until the land party came up. The ships did this, and after waiting about three months without learning anything of De Narvaez, sailed back to Cuba, the exploring party being supposed to have been lost in the Florida jungle.

In the meantime those on land had been floundering through the swamps, slowly finding their way northward along and as near to the west coast of Florida as they could, making frequent detours to the Gulf shores to look for their ships which they failed to find. How far northward they went is not definitely known, but they at last concluded that their vessels had either wilfully deserted them, or had been wrecked by a storm—a misfortune that frequently befell the small caravels in which the daring and hardy Spaniards of those days sailed long voyages over the seas.

De Narvaez and his men now concluded that they would build boats, as best they could and in them make their way back to Cuba. They had scarcely any tools fit for such work, but they managed to construct rough frames for several small craft. They made their stirrups and metal trappings into nails and other fastenings, and with rudely contrived saws worked out rough planks. Then they killed and skinned their horses and used the hides as sheathing for the boats. Having run short of provisions they were compelled to subsist on the flesh of their horses, a supply of which they loaded in their boats. So, in these wretched vessels equipped with sails made of the men's clothing, they put out into the waters of the gulf. Soon afterward a violent storm arose and drove the boats westward, scattering them, and finally wrecking all of them on the Gulf coast west of the mouth of the Mississippi, in localities believed to have been on the coast of Texas. A few of the people survived the disaster, but the leader was among the lost.

Only one boat-party of these storm-beaten men is known to have escaped destruction. It was commanded by De Vaca, who was the treasurer of De Narvaez's expedition, and was cast upon an island, supposed to be one of those in Matagorda Bay, but which De Vaca named "Malhado," which in Spanish means "bad luck."

In this battered company were the first Europeans who traversed the southwestern part of what is now the United States, and their experience constitutes the beginning of the modern history of the region. They were a long while in getting through the country and had a strange time while they were doing it.

De Vaca and his associates in trouble crossed over to the main-land, far into which they journeyed, and where they were presently made prisoners by Indians, who appear to have regarded them as supernatural beings, a fancy which De Vaca evidently took care not to disturb. The Indians were soon made to believe him capable of healing the sick and decrepit, and of performing miracles. After six years of this captivity, De Vaca, Dorantes, Maldonado, and a north Africa negro named Estevanico, made their escape and started westward with the expectation of reaching Spanish settlements on the Gulf of California.

They journeyed from tribe to tribe, De Vaca making the most of his ability to impress and mystify the natives, by whom they were almost uniformly well-received and hospitably treated. The strangers were thought to be immortal visitors, and their fame spread in advance of their journeyings. They were protected, provided with abundant food, and followed by throngs of the natives seeking to be cured of ills and to be blessed by the wonderful white men. De Vaca says he invoked God's blessing upon them and after doing so saw that many of their afflictions at once disappeared. They loaded him with gifts and made his pathway among them as nearly one of roses as they could. Of them he says:

"When upon the plains we traveled through so many sorts of people of such divers languages that memory fails to recall them. They ever plundered each other, and those that lost, like those that gained, were fully content. We drew so many followers that we had not use for their services. Whatever they killed, or found, was put before us without themselves daring to take anything until we had blessed it, though they should be expiring of hunger, they having established this rule since marching with us. Frequently we were accompanied by three or four thousand people, and as we had to breathe upon and sanctify the food and drink of each, and grant permission to do the many things they would come to ask, it may be seen how great was the annoyance."

The route was northwestward, or rather west by north, to some unknown point on the Rio Grande, which the narrator describes as "a great river coming from the north." After crossing the stream the party encountered people different from those met on the plains, which the leader says he called "the Cow nation," because of the numbers of cattle—presumably buffalo—possessed by them. He describes the region as being thickly populated, the people tilling the soil, and leading peaceful and industrious lives. This country which was afterward referred to as "a land of fixed habitations," was the country of the pueblo Indians. All of these tribes received the strangers with the greatest and most unstinted hospitality, and loaded them with presents. De Vaca, who continued his impressive ceremonies, as he had from the start, thus speaks of the generosity of the pueblo people:

"Indeed, they gave us all they had. To me they gave five emeralds made into arrow-heads, which they used at their singing and dancing. I asked whence they got these, and they said that the stones were brought from some lofty mountains that stand toward the north, where were populous towns and very large houses, and that they purchased them with plumes and feathers of parrots."

De Vaca was a sincerely religious man, and was deeply in earnest in his efforts to impress these gentle people with the meaning and ultimate purposes of the doctrines of his church. Of the effect his ministrations had he says:

"We possessed great influence and authority; to preserve both we seldom talked with them. The negro (Estevanico) was in constant conversation; he informed himself about the ways we wished to take, of the towns there were, and the matters we desired to know. We passed through many and dissimilar tongues. Our Lord granted us favor with the people who spoke them, for they always understood us, and we them. We questioned them, and received their answers by signs, just as if they spoke our language, and we theirs, for although we knew six languages, we could not everywhere avail ourselves of them, there being a thousand differences. Throughout all these countries the people who were at war, immediately made friends, that they might come to meet us, and bring what they possessed. In this way we left all the land in peace, and we taught all the inhabitants, by signs which they understood, that in heaven was a man we called God, who had created the sky and the earth. Him we worshiped, and had for our master; that we did what He commanded, and from His hand came all good; and would they do as we did, all would be well with them. They are a people of good condition and substance, capable in any pursuit."

De Vaca continued his westward journey through the land of these friendly people, numbers of whom persisted in going with him, and finally far in the west came upon some natives who had a few objects of Spanish manufacture which, they explained, had recently been left in their country by some remarkable strangers who rode upon large and strange animals, and had come from the southwest. De Vaca, realizing that he was approaching Spanish people, pushed forward far into the present bounds of Mexico, where he fell in with a party of mounted Spaniards returning from a foray toward the new region, and which was the same from which the natives had obtained the objects they prized so highly. With these cavaliers De Vaca and his party, including some of the natives from the pueblos, went on to Culiacan where the story of their adventures produced a most profound sensation among the Spanish people there. Spanish imagination was not curbed in those days, more than it is in ours, and the marvelous accounts the travelers gave of the country through which they had passed, particularly of the pueblo region which they described as "a land of fixed habitations," abounding in riches, greatly excited the curiosity and cupidity of their countrymen.

From Culiacan De Vaca later went to the city of Mexico, where he arrived July 25, 1536. From Mexico at his first opportunity he returned to Spain where he wrote his "Narrative," and where his stories led to De Soto's second and most disastrous expedition to Florida, which was then held to be a vast region of unknown limits, bordering all along the eastward and northward shores of the Gulf of Mexico. De Soto declared that he could and would conquer all the Florida country, and at his own expense. So the King of Spain gave him the title "Governor of Cuba and Florida," and sent him on his way which led to his death.

It has been assumed by some writers that because of De Vaca's long wanderings and his references to the bison—or buffalo, as they are usually but erroneously called—that he came far to the north. Some have it that he reached Colorado territory on the Arkansas, and proceeded to the site of Bent's Fort, where he turned southwestward. There is little or nothing on which to establish this as a fact. His description of the buffalo, aside from being the first given by an European, is interesting:

"I have seen them three times and eaten of their meat. I think they are about the size of those of Spain. They have small horns like the cows of Morocco, and their hair very long and flocky, like that of the merino; some are light brown, others black. To my judgment the flesh is finer and fatter than that of this country. The Indians make blankets of the hides of those not full grown. They range over a district of more than four hundred leagues, and in the whole extent of the plain over which they run the people that inhabit near them descend and live on them and scatter a vast many skins throughout the country."

It is not improbable that De Vaca saw buffalo while he was in Texas; and at any rate it was not absolutely necessary that he should have been as far north as Colorado, in order to have encountered them.

DeLisle's Map, 1722, locating "Quivira" near the latitude of Lake Superior.

Notwithstanding the extraordinary interest aroused in Mexico by De Vaca's accounts, and that the object of Guzman's brief foray in 1530 had not been forgotten, nothing was done toward further exploration in the north until three years had elapsed, the delay having been due to various causes, among which were neither a lack of curiosity nor of eagerness.

However, Coronado in 1539, having the hearty approval of Viceroy Mendoza, decided to organize and send out a preliminary expedition toward the strange country in the north. It was placed in charge of Marcos De Niza, a Franciscan monk, who had with him three others of that order, Daniel and Antonio De Santa Maria, and Honoratos. In the party were several natives of the northern country whom De Vaca had brought with him, and who had remained, or had been detained, at Culiacan. The negro, Estevanico, who appears to have been a most intrepid man, went along as guide and interpreter so far as he was able to be either. The Franciscan friars were glad to go because they were ever eager to propagate the faith among the benighted, by planting the good seed whenever and wherever opportunity offered. The De Vaca natives were expected to help as interpreters, and to conciliate the way through the new country.

So, with Spanish pomp and ceremonies, away they went on their journey. After many weeks of tiresome march over an uninviting land, Estevanico started on ahead of the others and reached the Seven Cities of Cibola, as Spanish imagination, excited by De Vaca's accounts, and the exaggerated versions of revived traditions, had designated the pueblos of Zuni. He had sent back tidings of his advance, to Marcos, but he did not tell of his evil conduct among the natives. As good Friar Marcos drew nearer to Zuni he heard grievous tales of Estevanico's gross licentiousness, and finally that the sinner had been killed by the exasperated people. Thereupon, Marcos, after having approached in sight of Zuni, of which he took careful view from a distant eminence, turned around and went back to Culiacan.

Marcos in his account to Coronado appears to have drawn liberally upon his imagination, and notwithstanding the fact that the loss of Estevanico was the only definite result, the stories were adorned, after the fashion of De Vaca, with much verbal embroidery, and many extraordinary conceptions of the country and people he had visited; even going so far as to confirm the tales told Guzman by the Tejos Indian slave, about the abundance of gold and silver in the northern cities. In his report he said:

> "The houses are builded in order, according, as the Indians told me, all made of stone, with divers stories and flat roofs, so far as I could discern from the mountain. The people are somewhat white; they wear apparel and lie in beds; their weapons are bows; they have emeralds and other jewels, though they esteemed none so much as turquoises wherewith they adorn the walls of the porches of their houses, and their apparel and vessels, and they use them instead of money through all the country. They use vessels of gold and silver for they have no other metal, whereof there is greater use and more abundance than in Peru."

Marcos afterward went around haranguing the people in public places about the wonders and riches of the great cities of the north, which were not great nor rich, and which he had seen only from a long distance. In his lecturings he was far more extravagant in his statements than he was in his reports to Coronado. Since that time the ability of Marcos as a romancer has never been seriously questioned.

Coronado was susceptible, and the narrative of Marcos determined him to organize a new and greater expedition, to head it himself, and get at least a fair share, from the standpoint of his time, of the gold and silver in the land of the Seven Cities. Having the approval of Viceroy Mendoza, Coronado set out on Easter Monday, 1540, with a concourse comprising three hundred and fifty Spaniards, zealous for God and athirst for gold; and about eight hundred Indian allies drawn from the adjacent country. Friar Marcos went along as a guide, and Pedro De Castenada De Nagera as secretary. It was this man who made the records of the expedition's marches, and from his assembled accounts all information of the enterprise has been derived. Coronado, before his departure, organized a second body of men which he left at Culiacan with instructions for it to follow within a month and join him in the land of the Seven Cities. Coronado proceeded to the sources of the Gila river, and thence to his Seven Cities of Cibola; or Zuni, as we shall hereafter know them. To this day the Zuni group consists of seven different pueblos, the Seven Cities of Cibola, of these old Spanish times.

Coronado and his army were bitterly disappointed upon their arrival there, and heaped maledictions on the heads of the friars who had so grossly deceived them with tales of fine cities abounding in riches. Instead of populous towns, rich in golden plunder, they had found but little more than ruined and deserted habitations in that region. The anticipated magnificent Seven Cities were only the forbidding pueblo communities of now hostile natives living a life of barbarism. Coronado had to capture the pueblos of Zuni by storm, and came near losing his own life in doing so. But he subjugated them and the surrounding country, making the natives pay dearly for having killed Estevanico, (or Stephen, as it would be in English,) and arousing a feeling of revengeful hostility among many of the pueblo Indians, that existed for many years after.

The command left at Culiacan joined Coronado at Zuni and several expeditions were sent into the surrounding country. Pedro De Tobar was directed to invest and subdue the Moqui towns, which he speedily did though not without trouble. The Moquis had heard that Cibola had been "captured by a very ferocious race of people, who bestrode great animals that devoured men; and as they knew nothing of horses, this information filled them with the greatest astonishment," and they resisted vigorously.

The Moquis told of a "great river on which there were Indians living who were very tall." Coronado sent Garcia De Cardenas to see about these people and to find the great river; an enterprise in which Melchoir Diaz shared, in a direction nearer the river's source, and in which he lost his life. Diaz named the Colorado the Rio Del Tizon. Cardenas discovered the Grand Canon of the Colorado, according to Castenado's account:

"After a journey of twenty days through a desert they reached a river whose banks were so high that they thought themselves elevated three or four leagues in the air."

Coronado's March—Ideal Sketch

While Coronado's lieutenants were ranging around to the west and northwest of Zuni the commander was visited by a delegation of natives from the eastward bearing gifts and offering friendship to the wonderful strangers of whose presence and deeds they had heard. Their leader, Bigotes (Moustaches), invited the Spaniards to visit his town, and Coronado sent Hernando De Alvarado with a small company to escort the visitors back home, which was in a place or province seventy leagues eastward from Zuni, and their pueblo was the Acuco, later known as the Acoma. Of this village the historian says:

"This village was very strongly posted, inasmuch as it was reached by only one path and was built upon a rock precipitous on all its other sides, and at such a height that the ball from an arquebus could scarcely reach its summit. It was entered by a stairway, cut by the hand of man, which began at the bottom of the declivitous rock and led up to the village. * * * * On the summit there was a great arsenal of huge stones, which the defenders without exposing themselves, could roll down on the assailants, so that no army, no matter what its strength might be, could force this passage. There was on the top, a sufficient space of ground to cultivate and store a large supply of corn, as well as cisterns [basins or reservoirs] to contain water and snow."

Alvarado went from Acoma to the country called the Tigeaux by the natives. Bigotes accompanies him as a guide and sponsor, and the visitors were hospitably received by the inhabitants, who asked that Coronado and all his company come and spend the approaching winter with them. Alvarado next visited the four-storied pueblo village Cicuye, the inhabitants of which made no resistance. Indeed, he was received everywhere by the simple-minded people more as a friendly visitor than as an invading conqueror.

While Alvarado was thus engaged Coronado visited another district in which was a group of eight large pueblos built of earth, instead of stone as all the others were. They are described as being seven stories high and such "as were seen nowhere else. These belonged to private individuals, and served as fortresses. They rise so far above the others as to have the appearance of towns. There are embrasures and loopholes, from which lances may be thrown and the place defended. As all their villages have no streets, all the roofs are flat and common to all the inhabitants; it is therefore necessary to take possession, first of all, of those large houses which serve as defenses."

Coronado next proceeded into the Tigeaux country that had been invaded by Alvarado, and found the hitherto peaceful people up in arms on account of outrages committed by roving squads of Spaniards. The leader had nearly two months fighting to do before the Tigeaux natives were subdued. Having crushed all opposition thus far, and formally taken possession of all the country he and his men had visited, Coronado proceeded northeastward to the Rio Grande, upon which at some point that has not been identified, he and his command wintered in 1540-41.

Some of the pueblo Indians regarded Coronado and his men with superstitious awe and reverence. When he left the Zuni country late in the autumn of 1540 he told those people he would return and remain with them. In consequence of his failure to do so, and of the religious veneration some of them had conceived for him, his memory became, in later years, confused in the traditions certain tribes retained of Montezuma.

The spirit of adventure, backed by a seemingly reckless courage, that inspired these old-time Spanish cavaliers, excites admiration. They were ready to go anywhere. By this time they had frequently heard from the natives of a mythical place which the invaders called Quivira. By some it was thought to be a city of fabulous wealth; by others a vast, populous region containing many treasure-laden towns. Whichever it was they were anxious to find it; and to do that now became the further object of the expedition. The winter was passed in happy anticipations of the journey and in preparations for it.

While Alvarado was at Cicuye he picked up an alien Indian who claimed to be from the country far to the northeast where the bison were in abundance, and which the Spaniards thought was adjacent to Florida where, they knew or had heard, De Soto was making explorations, or had undertaken to do so. Upon this Indian the Spaniards bestowed the name El Turco (The Turk,) from his resemblance in appearance and dress to the subjects of the Sultan. Whatever else El Turco may have done and been, he shed luster on his namesakes; for he was a most gifted and plausible rascal, and the truth was not in him. He told Coronado that he was a native of that country a thousand miles to the northeast, in which Quivira, roofed and paved with gold and silver, was situated. El Turco got another Indian named Xabe, from no one knows where, to corroborate his stories; and when still another Indian, named Sopete, the only one of the trio who told the truth, contradicted El Turco, the Spaniards would hardly listen to him. El Turco's story was the kind of story they wanted. To crush Sopete and his unpopular views, El Turco, who was a resourceful scamp, brought in some of his other friends, who were of the Querechos Apaches, and they readily confirmed all he had told about Quivira, although they knew nothing whatever about it.

While El Turco's stories were not very definite, they satisfied the Spaniards that Quivira lay far across the country to the northeast. Therefore, on May 5, 1541, Coronado and his little army left the banks of the Rio Grande and started after El Turco's jack-'o-lantern. Routes are not given in any satisfactory manner, but it appears that the party crossed the Raton mountains and entered the plains of Colorado somewhere near where the city of Trinidad is now located. Coronado pushed forward without obstruction or delay, to a point believed to have been the site of the present city of Wichita, Kansas, where, according to the accounts, the expedition was encamped late in June, at the junction of two rivers which were named St. Peter and St. Paul. These are supposed to have been the "Big" and the "Little" Arkansas rivers. Here the company was divided, the main part of the cavalcade, under Arelanno, being directed to return to New Spain; while Coronado with sixty or seventy chosen followers, proceeded on the long march toward Quivira, through a country improving in fertility and appearance as they advanced, and abounding with buffalo.

Finally, after forty-eight days of toilsome travel Coronado and his little company reached El Turco's Quivira, or the only one that could be found. It was a village of Indian wigwams, assumed by some writers to have been a Pawnee town. By others it is held to have been farther to the northeast than the country of that tribe. Coronado's historian says it was on about the fortieth parallel of north latitude, and that the country was occupied by powerful tribes of Indians whose chief ruler was called Tatarax, as nearly as the Spaniards could get it. The latitude and description given of the region, corresponds with the Platte river country, and if Castenada's account of the long distance traveled, and his reference to a great river seen, be correct, this village must have been in eastern Nebraska on or near the Missouri, and not far from Omaha. Jaramillo, one of Coronado's officers, mentions the houses in the Quivira country as having been unique in Spanish experience, and says of them:

> "The houses are of straw, very many being circular in shape. The straw reaches almost to the ground, like walls; on the outside on top is a kind of chapel or cupola, having an entrance where the Indians sit or lie down."

This is a strange account of the domiciles of our plains Indians, and it is certainly an error. No such structures were ever known to have been built by them by the white men who next visited their country. They appear to have used the ordinary wigwam from time immemorial.

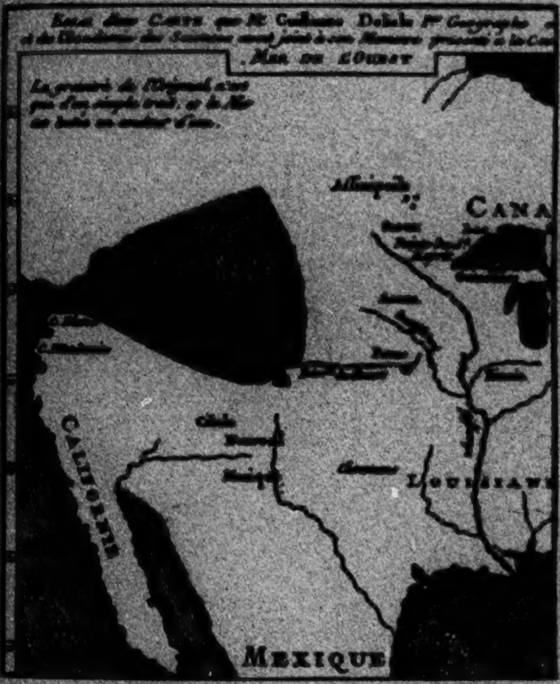
Castenada was exceedingly obscure in many parts of his narrative. In one place, referring to Quivira, he says it was situated "in the midst of the countries which adjoined the mountains that skirt the sea." In another he gives this account of the region:

> "It is in this country that the great River of Espirita Santa [the Mississippi] which Fernando De Soto discovered in Florida, takes its rise; it afterward passes through a province called Arache. Its sources were not seen; they are very distant and on the slope of the mountain range which borders the plains. It traverses them entirely as well as the Atlantic range, and its mouth is three hundred leagues from the place where De Soto and his comrades embarked."

With due allowances for confusion natural under such circumstances this description would apply very well to the Missouri.

The miserable Turco who had led Coronado on this long wild-goose chase, though he did not desert his dupes as he neared the destination, a thing he probably might have done, met a deserved fate. The Spaniards were angry enough when they realized how they had been deceived by Friar Marco's accounts of the Seven Cities of Cibola, but now they were in a fury of rage. They seized El Turco, and in his alarm that worthy confessed that he had been induced by some of the pueblo tribes to lure the Spaniards into that distant country where they would encounter fierce enemies, be overwhelmed and made prisoner-slaves, and nevermore be seen again by the southwestern people, many of whom had learned to fear the mailed invaders and to dread the future consequences of their continued presence in their country. After this admission of his treachery El Turco was condemned to be strangled, and strangled he was by the Spaniards with little ceremony.

Disconsolate over such an ending for his long and toilsome expedition, and cast down by the prospective effect it would have upon his fair fame, Coronado and his little cavalcade dejectedly took up their long march homeward, stopping on the way at the Indian town which later became Santa Fe, and going thence through the pueblo country to Culiacan, his capitol in the western part of New Spain (Mexico). His undertaking resulted in great personal misfortune to himself. While on the homeward journey he fell from his horse, and the injuries, which caused insanity, resulted in his death before the year (1542) closed. He was yet a young man, having been born in Salamanca, Spain, in 1510.



DeLisle's Map, 1752, showing the great "Sea of the West," and mythical city of "Quivira" in latitude and longitude of Denver.

The following quotation from Coronado's historian recounts some of the circumstances of the expedition, but its chief interest lies in the quaint description given of the buffalo, of which "the number was incredible:"

"From Cicuye they went to Quivira, which, after their account, is almost three hundred leagues distant, through mighty plains, and sandy heaths so smooth and wearisome, and bare of wood that they made heaps of ox-dung, for want of stones and trees, that they might not lose themselves on their return; for three horses were lost on that plain, and one Spaniard which went from his company on hunting. * * * All that way of plains are as full of crooked-back oxen as the mountain Serrena in Spain is of sheep, but there is no such people as keep those cattle. * * * They were a great succour for the hunger and the want of bread, which our party stood in need of."

"One day it rained in that plain a great shower of hail, as big as oranges, which caused many tears, weakness and bowes."

"These oxen are of the bigness and color of our bulls, but their bones are not so great. They have a great bunch upon their fore-shoulder, and more hair upon their fore part than on their hinder part, and it is like wool. They have as it were an horse-mane upon their back-bone, and much hair and very long from their knees downward. They have great tufts of hair hanging down on their foreheads, and it seemeth they have beards because of the great store of hair hanging down at their chins and throats. The males have very long tails, and a great knob or flock at the end, so that in some respects they resemble the lion, and in some others the camel. They push with their horns, they run, they overtake and kill a horse when they are in their rage and anger. Finally it is a foul and fierce beast of countenance and form of body. The horses fled from them, either because of their deformed shape, or else because they had never before seen them."

The account goes on to say that when the Spaniards in their excitement of the chase made up to a large herd of buffaloes, the frightened animals rushed together in such crowded and terrified masses that hundreds were crushed and trampled to death; and that in one place where a ravine interposed, the creatures plunged into it in their frantic efforts to escape from the hunters, and so filled the depression with their bodies that the remainder of the herd passed over upon them as on a bridge.

The Spanish accounts of Coronado's expedition, while probably intended to be full narratives of the ambitious undertaking, and perhaps as good as could have been made under the circumstances of those times, are, to an extent which now would seem to be most unfortunate, laden with many vagaries. Localities, directions, and other details appear in such an indefinite and confused way that it would be useless to make many positive statements concerning them. No doubt there are buried in the old archives of Mexico, much now unknown record of this and other early Spanish operations in the southwest portion of what is now the United States, that would be of great historical value and interest, even with their probable minor uncertainties.

In many Spanish chronicles there are frequent references to "Quivira," which appears to have been a name sometimes given to a vast, undefined region lying to the northward, and of which country Colorado is a part. Some of the historians have held that Coronado's route took him so far to the eastward into western Kansas and thence into Nebraska, that if it crossed Colorado, at all, it was only through the southeast corner. Others have held that he crossed the Arkansas river at or near the foot-hills and came northward by a route that brought him near the site of Denver. Still others suggest that his expedition did not pass up on the eastward side of the Rocky Mountain ranges, but on the west; and that Quivira was the Utah country. These quote Jaramillo's description of the Quivira habitations, and Castenada's statement that Quivira was "in the midst of the countries which adjoined the mountains that skirt the sea," to sustain their views, and assume that the great river "having its sources on the slope of the mountain range which borders the plains," was the Colorado, which the confused Spaniards took to be the Mississippi; and finally that the "province called Arache" through which "it afterward passes" was the former Apache country of our present Arizona.

Several old Spanish writers made the sea visible from Quivira, a possible reminiscence of Salt Lake. Others say that some of Coronado's men afterward claimed to have seen in Quivira structures similar to the ruined buildings now existing in southwestern Colorado. Greenhow, in his "History of Oregon and California" (1844), says this traditional locality was probably the region about the headwaters of the Arkansas and South Platte rivers. Scanland, a recent writer on the "Missions of California," states that according to an ancient Latin publication, dated 1579, California was then called "Quivira," but does not give the name of the ancient publication. All the sources of information about Quivira are exceedingly slender and equally obscure; and while nothing positive can be said of its whereabouts, there is little or no reason for doubting that Coronado's journey led him northeast across the great plains east of the Rocky Mountains, and that the Utah theory is hardly worth considering.

At all events the reader will probably conclude, after considering these diversities of opinion and Coronado's sorry experience with the region, that the term "mythical" as applied to such a place or country, was certainly well chosen.

CHAPTER IX.

Antiquity of Spanish Settlements in the Southwest—Moscoso's Expedition Toward the Rocky Mountains—Later Visits of Spanish Explorers to the Colorado Country—Their Tireless Searches for Gold and Silver—Ill-fated Expedition of Borilla and Humano—Founding of Santa Fe—Subsequent Northward Explorations—Spanish Settlements on and Near the Arkansas—Escalante's Colorado Explorations—Last Spanish Military Expedition Northeast from New Mexico.

We have been so long accustomed to accounts of and references to the early settlements along our Atlantic coast, that we almost unconsciously think of their localities as having been the scenes of the first appearance of Europeans within the present borders of the United States; and that the people who made those settlements were the pioneer white men in this great country. We forget that long before a beginning had been made there, white men of the Spanish nation were roving over this region of the west; a quarter of a century before the first Huguenot exiles visited Port Royal harbor, South Carolina, in 1562, and others of that persecuted people made a settlement on the St. John's river, Florida, in 1564; more than a quarter of a century before St. Augustine, Florida, was founded in 1565; three quarters of a century before the English settled at Jamestown, Virginia, in 1607; and nearly a hundred years before the Pilgrims landed at Plymouth Rock in 1620.

Hearing so often of what was done in the east, and so rarely of what was done here in the west-southwest, we forget the more remarkable achievements of these brave, visionary, romantic Spanish pioneers in the very dawn of our country's history.

Contemporary with the expedition of Coronado to the northeast from New Spain, another body of Spaniards was in the country west of the lower Mississippi trying to find a way to the Spanish settlements in New Spain. This was the company which had made its way to and beyond the great river, under the unfortunate De Soto, after whose death the command of which fell upon Louis De Moscoso, one of his trusted lieutenants. De Soto had landed in Florida on the shores of Tampa Bay in 1539, and was about two years in the wilderness between his landing place and the Mississippi. Some account of his explorations and fate appears later.

After De Soto's death, which occurred on June 5, 1542, Moscoso determined to proceed northwestward from the Mississippi river. He left the river about the middle of that month, and all the men being mounted, they made rapid progress after getting out of the lowlands' jungle. Early in August the party was encamped on the Arkansas river somewhere in what is now western Kansas. Fiercely hostile Indians were encountered, and the Spanish historian of the expedition declared that "the entire route became a trail of fire and blood." Of the fighting qualities of the savages he furthermore says:

"They were of gigantic stature, and fought with heavy strong clubs, with the desperation of demons. Such was their tremendous strength, that one of these warriors was a match for a Spanish soldier, though mounted on a horse, armed with a sword and cased in armour!"

While encamped on the Arkansas, Moscoso learned from some Indian captives, and from scouting parties he had sent out, that the country to the west was sterile, and thinly peopled by small bands of roving Indians; information that greatly discouraged the leader. Like the Coronado accounts, the chronicles of Moscoso's expedition are vague and uncertain. Several versions of them that undertake to specifically state movements and localities in connection with it, are open to many suspicions.

It can not be said with desirable approach to accuracy how far west Moscoso penetrated. It would seem that scouting parties went farther than the main body of the command, and that some of them came into what is now Colorado, after fifteen days' absence from the established camp. Moscoso's chronicler asserts that "they saw great chains of mountains, and forests, to the west, which they understood were uninhabited."

Some later versions of the Moscoso narratives have it that he came with his command as far as the Rocky Mountains, but did not explore them. There is no satisfactory evidence that he did so or that, beyond what may have been done by his scouting parties, the expedition as a whole entered Colorado territory, at all. Moscoso has been represented as the first European to tread the soil of our State, and the first to look upon the Colorado mountains—statements that would seem to escape acceptable verification. That Coronado was the Spanish pioneer in this general region, in 1541, is almost a certainty, for there is little foundation for the theories that he visited Utah instead of the great plains.

Dismayed by the prospect that lay before him to the west, Moscoso decided in the autumn to retrace his way to the Mississippi with his seriously decimated command. While on his retreat eastward he discovered the well-known Hot Springs of Arkansas. His worn and wasted people, when they reached them, believed that they were at last to be rewarded for all their hardships and sufferings. His chronicler says:

> "And when they saw the foaming fountain, they thought it was the long-searched-for "Fountain of Youth," reported by fame to exist somewhere in the country, but ten of the soldiers dying from excessive drinking, they were soon convinced of their error."

From the Hot Springs Moscoso proceeded directly to the Mississippi which he reached about the middle of December, after an absence in the west of six months. Having concluded to endeavor to reach Cuba by water, several months were passed in building boats and making other preparations, after which he started down the river and came to its mouth on July 18, 1543, thus antedating La Salle's discovery of that river's entrance to the Gulf, by one hundred and thirty-nine years.

Several purposes have been attributed to Moscoso as motives for his hazardous expedition. One is that he expected to discover much gold and silver; another, that he expected to reach the Spanish settlements in the far southwest; another, that he intended joining Coronado on his Quivira expedition. While De Soto was west of the Mississippi he heard reports from the Indians that far in the west there were strange men making war on the native people and subduing them. De Soto had concluded that these strangers must be Spaniards making their way northward from Mexico. The Indian accounts were probably based on rumors of Coronado's operations in the pueblo country in 1540. Moscoso acted upon this information and set out to find and join his countrymen, though he greatly underestimated the distance that lay between, for he concluded that "they could not be far distant," and expected to encounter them in a few weeks' march. He did not know who they were, and was not searching for Coronado, for it is not likely that after so long an absence from communications with Spanish settlements or authorities, that he had any knowledge of that explorer's recent presence on the plains. It would seem probable, however, that the routes of the two parties intersected at some point.

In 1884, several grave-like mounds were discovered in McPherson county, Kansas, which, upon being opened under supervision of members of the faculty of Bethany college, at Lindsborg, revealed many relics proving that some of the mounds were burial places of Europeans. Among the objects exhumed was a piece of steel chain-mail armor, which, it is believed, was part of the equipment of one of Moscoso's men, or of one of Coronado's. Some writers have thought De Vaca may have gone that far north in his wanderings, and that he might have been responsible for the presence there of those relics, oblivious of the fact that long before he and his party escaped from captivity their personal belongings had disappeared, and that they had scarcely anything with which to cover their nakedness, according to De Vaca's narrative.

Among those who accompanied Coronado on his journey in 1540-42 was Padilla, another Franciscan friar. A few years afterward—the exact date not being available to us—Padilla set out from New Spain with several companions to re-visit the Quivira country. Nothing was ever heard of them after their departure, and how, and when, and where they lost their lives are unknown.

After the ventures of Coronado and Padilla, other expeditions from New Spain far to the northward were not undertaken for a considerable period, although several friars at various times entered the pueblo country seeking to establish missions, most of them losing their lives in the attempts. One of the more prominent of these was Augustin Ruiz, who was killed in 1581. In that year two others of the devoted Franciscan fathers, whose names are not retained, in company with one Chamuscado, a miner or gold-seeker, and a small company of followers, came up into the Zuni country where the friars remained to evangelize the natives, at whose hands they, also soon after met their death. Chamuscado and the rest, inspired by quite different motives, got out of the region without imperiling themselves.

In 1582 Espejo was sent by the Viceroy of New Spain to learn the details of the fate which had overtaken these friars, to see what could be done toward protecting such missionaries in the future, and otherwise to explore the region to the north. He proceeded to Zuni and from there to the Moqui country; but it is not known whether he went as far as southern Colorado, or not. Espejo visited some seventy-five pueblos, which he estimated to have had a population of two hundred and fifty thousand; in which he was, of course, vastly mistaken. He then made his way to Santa Fe, where he founded a mission; and he afterward explored the Pecos valley.

In the years immediately following Espejo's enterprise, several unimportant Spanish expeditions were made to the north from New Spain, but none of them appear to have gone as far as Colorado.

In the closing years of the sixteenth century, the Spaniards, after considerable fighting with the natives, had subdued a large portion of the region now represented on the maps by the western part of Texas, New Mexico, and Arizona, and were in nominal, if not actual, possession of it.

A prominent Spanish leader in those times was Juan De Onate, of Zacatecas. His wife was Isabel, a grand-daughter of Cortez and a great-grand-daughter of Montezuma. In 1595, he organized and led a pretentious expedition for exploring and adventure in the north country. His route was up the Rio Grande and into the San Luis park region of Colorado. Onate was a colonizer who desired to definitely establish Spanish rule in the new country; and he was also a seeker for the precious metals. He established several settlements, the most important of which was the older Chama, the one on the Chama river near its confluence with the Rio Grande, which survived the vicissitudes of all the intervening years and still exists. In the San Luis park in the vicinity of the site of Fort Garland, he is recorded as having discovered gold and silver mines which his people were said to have successfully developed. From this time forward the Spanish population in that region steadily increased.

The old Spanish accounts state that mining was extensively engaged in, but it is now difficult to identify with certainty the localities in which it was done. They reduced the natives to virtual slavery for the purpose of working these mines, wherever they were. Some of them were undoubtedly in our San Luis park and in the San Juan country. However, the Spanish accounts of their mining operations are believed to have been greatly exaggerated, and the alleged importance of these mines is regarded with some doubt.

There is a cloudy story of a Spanish undertaking in 1595, under Captain Borilla, which rivaled that of Coronado in audacity and the distance traveled. It was said to have been sent against the Indians on the plains in what appears to have been southeastern Colorado, so far as any locality can be determined from the account. Borilla is represented to have become excited by reports of great wealth among the Indians farther to the northeast, and disregarding his instructions, started toward the Missouri river to see about it. The reader will observe that Borilla was heading in the direction of Coronado's Quivira; or rather, El Turco's Quivira. The Spanish Governor of Viscaya, in northern Mexico, sent Cazorla to overhaul Borilla and bring him home. The latter refused to return and persisted in his new enterprise. Later, in a quarrel with one of his subordinates, named Humano, Borilla was killed, his slayer taking command of the expedition, which the hazy accounts say, soon reached a large river that was crossed on rafts. Here three Indians who had accompanied the party from New Mexico, deserted and started back to their own country. One of them reached the Spanish settlement on the Chama, and he informed the Spanish official, Onate, of what had happened up to the time he left the adventurous party.

It appears that Humano after crossing the river went onward, and at some unknown place, was attacked by Indians, who fired the grass around the invaders, and then destroyed all but two —Alonzo Sanchez and a half-breed girl, both of whom they adopted into their tribe. They afterward so liked Sanchez that they made him a chief; at least, this is in the story Alonzo told years later of the concluding incidents of Borilla's ill-starred undertaking.

In 1601 Onate organized an expedition at Chama and started northeastward for the great plains country to learn something further about the fate of Humano and his associates. He was absent from June to October of that year, and is credited with having come northward about to the latitude of Denver and thence gone east through the country south of the Platte river, far into what is now eastern Kansas; some writers have him go as far as the Missouri river. His enterprise appears to have been destitute of noteworthy events, for the accounts of it are exceedingly meager and unimportant, with nothing definite as to what further knowledge he gained of Humano's fate.

TEXAS
MEXICO

There are several uncertain references to an expedition from New Spain up this way along the eastern base of the mountains, which is said to have traveled "many leagues," but all particulars as to who led it, and its objects, are lacking. Indeed, it is difficult to find any trustworthy record of Spanish visits to the immediate locality of Denver up to this time, in any of these old and misty accounts. After the occupation of the New Mexico region by the Spaniards, and the founding of Santa Fe, minor excursions in many directions were common, but there is no evidence that any of them went far enough to have reached the Platte river near Denver, though several of them came to the vicinity of Pike's Peak, and that lofty mountain became well known to the early Spanish adventurers.

Santa Fe—Santa Fe de San Francisco, the City of the Holy Faith of St. Francis—is probably the oldest and certainly the oddest permanent town in the United States. When the Spanish first visited it, in 1542, it was a permanent Indian town and appeared to have existed for many years. This was twenty-three years before the founding of St. Augustine, in Florida. In 1580, a Spanish mission for the benefit of the Indians had been established at El Paso, and it was about two years later, as we have stated, that Espejo founded one at Santa Fe. Others soon followed at various places in the region. Espejo is by some held to have been the founder of Santa Fe; but the first organized Spanish colony having settled there in 1605, the history of the place as a Spanish town is usually dated from that year. In 1640, it became the capital of the province of New Mexico.

In 1662 Diego Penalossa came out of Mexico to Santa Fe with a large company of Spanish cavaliers, and thence proceeded northeast across the country to the plains of Kansas. It is narrated that he went far toward the Missouri river which, according to some accounts, he reached; but nothing is definitely told of his purposes or of what he succeeded in doing, and the narratives of his enterprise are left singularly barren of information of any historical consequence.

In 1680, the native people of the pueblo country, who had long been on the verge of rebellion, revolted, and under the lead of Pope, a chieftain of great influence, marched on Santa Fe, and there besieged Governor Otermin and the Spanish army, who were finally compelled to evacuate the town and retreat to El Paso. For thirteen years the pueblo people continued to control their old country, defeating successive Spanish expeditions sent against them. In 1693 Diego De Vargas succeeded in re-conquering them and peace was made, one of the terms of which was that there should be no more slavery in the mines. The Spanish historians say that the Indians had, in the meantime, filled up all the shafts, and otherwise obliterated or destroyed all evidences of their slavish toil in their taskmasters' mines.

Aside from these events there had been a long period of inactivity in the southwest. The Spaniards had ceased from their ambitious exploring and expeditionary labors for many years, and their seventeenth century history contains little or nothing more of interest pertaining to the territory near Denver. In 1698, they began to be apprehensive of inroads by the French, who were then preparing to make permanent settlements in "Louisiana." This fear of invasion from that quarter grew out of La Salle's operations, the particulars of which appear in another chapter.

In 1719 Valverde, at the head of upward of a hundred Spanish cavaliers and their followers, with a large contingent of Apaches started out from Santa Fe to make war upon the Comanche and Ute Indians who had been committing some of their customary depredations, in Spanish territory. Valverde was also charged with the duty of ascertaining what the French, of whom the Spaniards were then very suspicious, were doing or trying to do up here in this region. In carrying out his purposes Valverde appears to have skirted the eastern base of the Rocky Mountains as far north as the South Platte river, and if he did not reach the site of Denver, it is believed that he came nearer to it than any of his Spanish predecessors. The accounts of his enterprise say he crossed a river flowing eastward from the mountains, which, from the related circumstances probably was the Arkansas, and proceeded northward some leagues beyond it. Of the faring of the Utes and Comanches little is told, so it is likely that they did not seriously suffer.

In 1720 an expedition was dispatched from Santa Fe against the French in the Missouri river country, an account of which unfortunate enterprise appears in our next chapter.

About the middle of the eighteenth century the Spaniards founded the old and historic town of Taos—named for the Spanish cavalier Fernandez De Taos—in the valley of the Rio Grande, about midway between Santa Fe and the present southern boundary of Colorado. Pando, a Spaniard, had settled himself there in 1745, and there had long been a native pueblo at or near the place. After establishing their Taos colony the Spanish promoters crossed the mountains to the valley of the Arkansas river, with which they had by that time become somewhat familiar, and made, according to their accounts, several settlements in what is now southeastern Colorado.

One of these was on the Las Animas—or Purgatoire—river, near its confluence with the Arkansas; another, a kind of military post, was on the Huerfano river, to the eastward of the Sangre De Christo Pass, which it was intended to guard. Along the Arkansas for some distance southeast of the city of Pueblo traces of this old Spanish occupation still exist in the forms of ditches and remains of foundations for buildings. But these attempts of the Spaniards to establish themselves along the Arkansas proved failures, the settlements being abandoned within a few years, probably in consequence of the plains Indians' hostility, though nothing definite is known of the immediate cause of their abandonment. When Lieutenant Pike traversed the Arkansas valley to the mountains a half century later, he found the region destitute of any kind of inhabitants, and in his very circumstantial narrative of each day's events he does not mention having seen the sign of a single human habitation along the Arkansas in what is now southeastern Colorado; although he noted that the Indians of central Kansas possessed a few wares of Spanish manufacture which they had long before obtained of traders hailing from Santa Fe.

In 1761, Don Juan Rivera in company with Pedro Mora, Joaquin Lain, Gregoria Sandoval, and a retinue of attendants, made an extended exploration of what is now southwestern Colorado. They visited the valley of the San Juan and from there went up into the Gunnison river country, which they traversed for several months. Rivera searched diligently for gold and silver, and found some of the more precious metal on the San Juan and its tributaries. After the "Pike's Peak gold discoveries," when the American miners got down into that region they found many traces of Rivera's mining operations of a hundred years before.

Through the last half of the eighteenth century there were many Spanish parties prowling around in the country to the northward of Santa Fe. Natural love of adventure, inborn to the Spaniards, curiosity, and the ever-present hope of finding gold and silver—preferably dug out and awaiting capture—prompted these enterprises, which were neither of much interest nor of great importance. Some of the cavaliers careered their way along the foot-hills up here to and far beyond the South Platte. There was much to induce them to penetrate this more inviting territory and little or nothing to prevent. If they encountered hostile Indians and did not want to fight them, their fleet steeds and good horsemanship enabled them to quickly run away. Cachupin, who was Governor at Santa Fe for a long time in the last half of that century, sent several such expeditions into this plains country.

Prior to 1775, Padre Junipero Serra, in charge of the Spanish missions in California, had urged the authorities at Santa Fe to explore and locate a route or trail from that town to Upper California. Accordingly, Padre Francisco Silvestre Velez Escalante, Ministro Doctrinero of Zuni, was appointed to lead an expedition to see what could be done toward that end, and made preparations for the long and perilous journey.

In 1776, Escalante and Padre Atanacio Dominguez, the Visitador Comisario of New Mexico, with Joaquin Lain, who had been with Rivera fifteen years before, to serve as guide, set out from Santa Fe with a suitable company of retainers on this long and toilsome mission. They proceeded northwest to the San Juan river, which they reached at a point three leagues below the junction of the Navajo, on August 5th. This place they called Neustra Senora Las Nieves, and it was the first in Colorado receiving a definite name on a certainly known date. From Nieves the party again proceeded northwest, crossing several affluents of the San Juan, giving them names still retained, as Piedra Parada, Pinos, Florida, and Los Animas. (To avoid confusion of river names it should be remembered that the Rio Los Animas in southwestern Colorado is a tributary of the San Juan; and that the Rio Las Animas, or Purgatoire, in the southeastern part of the State, is a tributary of the Arkansas. There are also two Cherry creeks: one in the southwestern corner of the State, and our own sometimes riotous stream here at Denver.) The La Plate range was named Sierra De La Grulla; and the La Plata river, the San Joaquin. In the canon of this stream, Escalante stated, were evidences of Rivera's pioneer mining operations, fifteen years previous.

When Escalante reached the Rio Mancos he heard reports from some Indians he encountered, of gold mines in the country northeast, and observed with wonder the ruined habitations of the ancient Cliff Dwellers, that are so abundant in that region. He and his associates were the first white men who ever beheld them, and his brief references to them are the first of which there is any record. He saw but few of the many ruins, and knowledge of what he did see was long-buried in the dust-covered archives of New Mexico.

From the Mancos the explorer went northward to the Rio Dolores. Along this stream he gave names to many places and localities—Asuncion, Aqua Tapada, Canon Aqua Escondida, Meiro Labarinto (in honor of one of his officers), and Ancon San Bernado. A small tributary of the Dolores was called Paraliticas in consequence of having there encountered three paralyzed Ute squaws. Near this point the party left the canon of the Dolores and entered Gypsum valley, or Cajon Del Yeso, a name it still bears. Ascending to a mesa, they went six leagues northwest to their next station, San Barnabe. Another six leagues brought them through a canon to the San Miguel, or, as they named it, Rio San Piedro. Places where they encamped on the north side were named San Luis, San Felipe (where they found more traces of Rivera's expedition), and Fuento De La Guia. Then they passed through the canada Honda, probably the Uncompahgre Park, to Ojo De Lain, named so in honor of their guide.

Here the party reached the Uncompahgre river —spelled by Escalante "Ancapagari"—but which they christened the Rio Francisco. Escalante gave the distance traveled from the San Miguel to this point as twenty-four and one-half leagues, indicating long detours in the Uncompahgre country. The first station beyond was named San Augustin, and the distance from the Uncompahgre to the Gunnison river by the route followed was held to be ten leagues. The Indians called the Gunnison river "Tomichi," but Escalante named it San Javier. Rivera had reached this region, and a little farther down a cross had been cut by him in the river bluff.

Proceeding northeasterly four leagues up the Gunnison, the explorers came to a stream which they named Santa Rosa; and farther along they reached another which they called Rio Santa Monica. This was probably the north branch of the Gunnison's north fork. Following this stream they came to the Rio San Antonia Martir, the present Divide creek. The two buttes, North and South Mam, they named San Silvestre (in honor of Escalante himself), and Nebuncari, and the present Mam creek was called Santa Rosalia. Near here they crossed the San Rafael, or Grand river, proceeding thence northwest to the White river—called by them San Clemente—to the point about where it crosses the Utah boundary, where they arrived September 9th, after having been on their journey upward of two months, and traveling eighty-six and one-half leagues from the Dolores.

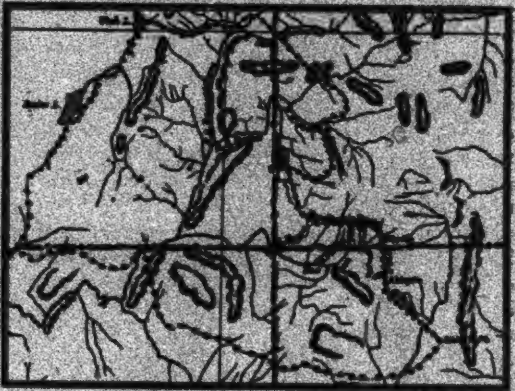
Escalante observed two other trails while on his way, and states that there was a shorter route than the one he had followed from the Gunnison to the Grand. Beyond White river, the explorers passed through a long canon, on a wall of which pictures of three shields, a spear, and a couple of warriors in combat, were painted. Here they saw veins of metal, and found buffalo trails, from which latter circumstance the gorge was named Arroya Del Cibola. At Green river they came to a lone tree, and six cottonwoods in a group. On one of these Lain carved his name and the date, 1776, with a cross above and below.

Passing into what is now Utah, Escalante went west to the great Salt Lake, and he and his companions are believed to have been the first white men who visited that remarkable body of water. On their return journey the explorers traveled expeditiously by a more southerly route, which presented fewer obstacles to their progress, and reached Santa Fe in safety after an absence of more than a year. For that time and under then existing conditions their undertaking was a remarkable one, and in accomplishing it they afforded another example of the courage and devotion to duty characteristic of the old Spanish priests and missionaries wherever they were in the southwest. The name of Father Escalante is retained in many places in western Colorado, and most fittingly in the designation of the great range of mountainous hills in the northwestern corner of the State.

A Spanish trail was established from Santa Fe to California, northwest to and a little above the thirty-seventh parallel of latitude, which is the south line of our State, thence westward to what is now southern Utah, and on down southwest to San Bernardino in what is now southern California. A Salt Lake trail was established later, branching from the one to California, and crossing the present west boundary of Colorado just south of where the Rio Dolores passes into Utah.

We have entered much into the details of this expedition, partly because they illustrate the old Spanish preference, if not fondness, for saintly nomenclature, and partly because of the remarkable character of the undertaking. Escalante's accounts are very circumstantial—much more so than any other narrative of Spanish explorations in what is now Colorado—and many of the names he bestowed in the western country have not been displaced.

In no part of Colorado is there any conspicuous evidence now remaining of old-time Spanish occupation. Notwithstanding that those people so frequently visited this part of the country, their only attempts to make permanent settlements were their short-lived efforts on the Arkansas river. But there, as elsewhere in the territory of our State, they appear to have built no mission buildings, which were usually substantial and enduring, and their other structures soon decayed and disappeared. It is probable that their evangelizing labors were not so encouraging among the warlike and war-loving tribes of the plains as they were among the gentler and more peaceable people of the pueblo country.



Map showing Escalante's Route.

There remains but one more story to tell of Spanish expeditions into this region of the west, and it is of a somewhat daring military enterprise. Immediately after the United States purchased the Province of Louisiana with its uncertain limits in the southwest, the Spanish authorities became excited and apprehensive. As the claims of our government became known to them the feeling rose higher, until it appeared that war only could settle the dispute. The Spaniards were further exasperated by rumors of Burr's conspiracy, and reports of his intention to invade and conquer the northern Spanish provinces, after he had established his republic in the southwest. By 1806 these irritations had strained the relations between the two countries to the breaking point.

In the spring of that year, the Spaniards having heard through their emissaries at St. Louis of Lieutenant Pike's proposed expedition into the west, for which preparations were then making in that city, and attaching a greater importance to it than it would seem to have deserved, determined to make a counter-move against it and other assumed American aggressions. Therefore, by order of General Salcedo in command at Chihuahua, a military expedition was organized with three objects in view:

First—To descend the Red river to intercept Pike's or any other American force approaching the assumed Spanish frontier, that it might meet; to oblige such forces to return without attempting to farther penetrate the country; and in the event of their refusal to retreat to make them prisoners of war.

Second—To thoroughly explore all the interior parts of the country between the Platte and Arkansas rivers from the northeastern frontier of New Mexico to the Missouri river.

Third—To visit the Comanche, Pawnee, Kansas and other Indian tribes, and make proffers of friendship and alliance with them; and, under positive orders, "to oblige all parties or persons in the above specified countries, either to retire from them into the acknowledged territories of the United States, or to make prisoners of them, and conduct them into the province of New Mexico."

This elaborate undertaking was committed to the charge of Lieutenant Don Facundo Melgares, a native of Spain, a distinguished officer in the army of New Spain, and a man of the highest personal character. Melgares marched from the Province of Biscay, with one hundred dragoons of the regular service, to Santa Fe, where the expedition was organized and equipped, and supplied for a six months' campaign. In their then apprehensive state of mind the Spanish authorities were anxious, as a precautionary measure, to make friends and allies of as many of the plains Indians as they could; and especially with the "Ietons [Comanches], Pawnee Republic, Grand Pawnees, Pawnee Mahaws, and Kanses." To the head chieftains of these tribes the commanding officer "bore flags, a commission, grand medal, four mules; and with all of them he had to renew the chains of ancient amity, which was said to have existed between their father, his most catholic majesty, and his children, the red people."

Therefore, when Melgares left Santa Fe for the northeast, with his force increased by five hundred mounted militia from that province, making a total of six hundred men, he took with him an aggregate of two thousand and seventy-five horses and mules, and a great array of supplies and goods. Each soldier had to lead and care for two horses and one mule. The little army went down along the Red river into the heart of the Comanche country. No American invaders were encountered, but councils were held with the Comanches, the commissions bestowed, and the presents delivered. Those people were inclined to be hostile to Americans, but they would have gladly accepted the mules and trinkets if they had not been so.

Melgares then marched northeast across the country to the Arkansas river, which he reached at a point in what is now the middle southern part of Kansas, where, leaving about one-third of his men and his disabled horses, he crossed the river and pushed forward into the Pawnee country to the north. This daring invader went on to a point on the Solomon Fork of the Kansas river in what is now the middle northern section of Kansas, keeping, in the meantime, a sharp outlook for Pike's expedition which he knew must be somewhere in that country. On the Solomon he met and counseled with the chiefs and warriors of the Pawnee tribes, mutual friendship was declared, and the mules, commissions and other proofs of Spanish esteem were delivered. He did not visit the Mahaws and Kansas tribes, owing to the discontent of many of his men, and the jaded condition of his horses.

The Spaniards returned to their point of crossing the Arkansas, whence the united force marched up that stream nearly to the site of Canon City, hunting for Lieutenant Pike. Concluding that Pike was not to be found in this part of the country, they went down along the foot-hills, crossed the mountains to Taos and thence to Santa Fe, where they arrived in October.

Melgares fell in with several American traders while on his march through American territory and frightened them into leaving the country forthwith; but he was too early to meet Pike. However, that brave officer was but a few weeks behind him, and on the march up the Arkansas followed the Spanish trail, which was marked all the way by camping places.

While Pike was a semi-prisoner in Spanish hands he made the acquaintance of Melgares at Santa Fe and was in his nominal custody on the journey from that place to Chihuahua. The two became fast and admiring friends, and Pike in his "Account" almost fails of words to adequately express his admiration for the charming and noble character of Don Facundo Melgares, to whom he was indebted for endless kindnesses and courtesies.

The war-cloud passed away, the boundary disputes were peaceably settled, and this brilliant exploit of Melgares was the last expedition of the Spaniards into a land that had long been endowed by their willing imaginations with marvelous wonders, and with populous cities holding great riches.

CHAPTER X.

Pioneer French Incursions Toward the Denver Region—Uncertainty of Boundaries—Early Movements Northwest from New Orleans—Vague Geographical Beliefs of the French—Westward Expeditions by Way of the Missouri River—Spanish Movement Against Them—First Known Visit of White Men to the Site of Denver—Subsequent French Operations—Jurisdictions in Authority Over the Denver Region.

This region immediately around Denver has but little ancient history; that is to say, it has not much within the white man's period on this continent, and most of what there is is by reflection. What there may have been in the long ago, centuries before his coming, is buried far in the depths of vanished years. Some rays of light were later flashed over the country by the old-time Spanish people from the south, but there was no glare as they passed on their adventurous journeys and disappeared again. Like a far-off dull flame in the night-time, these feeble beams show us outlines of the figures close about them, and then die down.

After the Spaniards, came the French making their cautious, hesitating advances toward the country of the South Platte, but without establishing themselves and entering upon its possession. It is to these old-time movements of the French that we will now briefly give some consideration. There is not much to tell, and the story of it is likely to be the shortest we will have, although it involves some account of Spanish endeavors to keep the French intruders from coming near the domain here, which the former held to be subject to the Castilian flag.

The boundaries of French and Spanish territory here in the west and southwest, were never clearly defined nor agreed upon between those nations. In the beginning, this made little difference. The new country was so vast that New Spain seemed to have no limits, nor was there any apparent necessity through many years for assuming it to have any. But after the French pushed out to the west by way of the great lakes, and so soon thereafter established themselves near the mouth of the Mississippi, of which events we shall give some further account in the story of their "Province of Louisiana," the domination of the Spaniards over this great, central region, not then very clearly defined nor actually maintained was, insofar as it may be said to have existed, seriously menaced by the activity of their rival neighbors.

As to "Louisiana," the French had adopted the policy of claiming for it a great portion of everything that lay out-doors, and afterward ascertaining how much of their claim they could make good by occupation and more or less nominal possession.

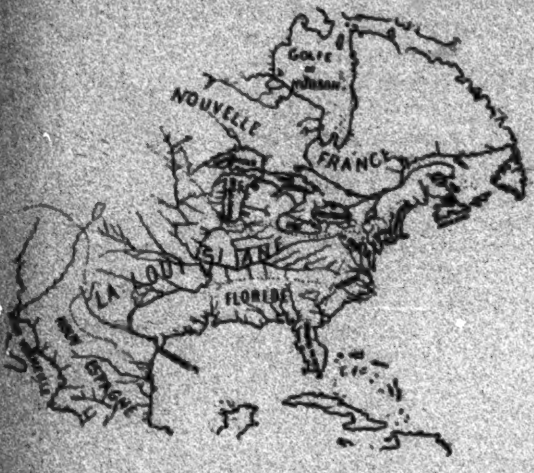
In consequence of this, and of French movements in harmony with it, there was, in the early years of the eighteenth century much mutual apprehension, rivalry, jealousy and friction between the French in lower "Louisiana" and the older Spanish authority in our southwest. Very soon after the French had settled themselves on the Gulf coast just east of the mouth of the Mississippi, considerable curiosity concerning the country far to their northwest was aroused among them—a country of which the authorities of New Spain expected to take actual possession whenever they thought they had use for it.

In 1712 a company of French adventurers was made up down there to penetrate the unknown region and learn something about it. These people started off in a northwestern direction by land and were gone several months. There is little record of the enterprise, beyond the facts that these explorers went away, stayed away for a season, and came back again; and that they went far out into the plains country where they saw vast numbers of buffalo, and heard of great mountains still more distant.

By the time this had happened the French traders and trappers coming in from the northeast had begun navigating the Missouri river and its branches for considerable distances. None of them had penetrated the region anywhere near Denver at that time, but they had gone toward the northwest country of the Missouri over distances almost as great. But it was not many years before a party of French explorers did come out here by the way of the Platte and pass over the site of Denver, as we will presently see.

Soon after the Crozat rule began in lower Louisiana in 1713, its officials heard accounts of the Arkansas river having been explored to its sources in the "mighty mountains of the west" by a party of French adventurers a short time before. Beyond the probability that these reports grew out of the expedition of 1712, they have never received very serious consideration. It would seem that the pioneer French on the upper and lower Mississippi had derived their vague and very slender knowledge of the "mighty mountains," which they then occasionally mentioned in their stories, from the Indians, and from Spanish sources by way of Mexico or New Mexico—or, to be more specific, New Spain. However, the Crozat administration early attempted to establish trade relations with the Spanish region and the Arkansas river country, by way of that river, but the feeble and short-lived efforts came to naught. It is not known how far the Crozat people ascended the Arkansas.

In 1717, Bourgmont, a French explorer and trader who, for several years had periodically visited the country along the lower reaches of the Missouri river, reported that he had learned that the "Panis" (Pawnees) and their kindred in the remote west were trading with other peoples living about a great lake. This faraway race was represented as small of stature, and dressed like Europeans. This story came to the ears of the French officials in lower Louisiana, and notwithstanding their knowledge of Spanish occupation of New Mexico, and the ascertained fact that China was separated from America by a great ocean, surmised that these people might prove to be Chinese.



Franquelin's Map of North America, 1684

In a memorial which was prepared at Paris in 1718, outlining a plan for giving Louisiana a dominating position in North America, it was made a part of the means to that end that "the mines on the Missouri" should be worked, and commerce with Mexico established from that basis. "Inasmuch," it went on to say, "as the Missouri has one branch leading to the South Sea, trade can also be opened with Japan and China." The Parisian promotors of this enterprise supposed the River Platte, of which they had a little knowledge, to be the branch of the Missouri leading out to the South Sea.

In 1719, La Harpe, a French officer, left New Orleans with a small company, on an exploring expedition into the country to the northwest. He ascended the Arkansas river early in the summer, and according to his stories, must have gone as far northwest as the plains of southeastern Colorado, whence he returned the way he came, in consequence of Spanish protests against his presence in that part of the country. He gave glowing accounts of the beauty and fertility of the region he had visited.

In 1719, Du Tissenet, with a considerable cavalcade, also put out from New Orleans, on a similar errand, traveling by land. How far he proceeded and how long he was gone, are not definitely stated, but this inroad, in connection with other circumstances, alarmed the Spaniards in New Mexico. Du Tissenet came up this way far enough to encounter some Indians who were friendly to the Spaniards, and they reported his presence in the country.

In the meantime the numbers of French trappers and traders had been increasing along what was then considered by Spain to be the northeast frontier of the Spanish domain here in the west-southwest, and the Spaniards determined to put a stop to these encroachments, if they could.

In the autumn of 1719 La Harpe tried another route to the west. He followed the Missouri until he came to a large branch supposed to have been the Platte. Turning westward along this stream he proceeded a distance which is not definitely known, but which was far enough for him to learn of Valverde's expedition northeastward from New Mexico into the plains of Colorado; whereupon the Frenchman turned back. La Harpe reported that he found unicorns and other fanciful creatures in the country. By way of comment on this, Charlevoix remarked that traveling in the distant west seemed to unfit most men for telling the truth.

In 1720, a Spanish force was dispatched from Santa Fe to drive all the French out of the territory claimed by the Spanish, or to which they were getting ready to lay claim. Historians do not agree as to all the circumstances of this movement and its consequences. But the Spaniards marched from Santa Fe northeastward nearly to the Missouri river, though it does not appear that they fell in with Du Tissenet and his party, who were the immediate provocation of the enterprise. Some of the accounts say the Spaniards blundered, which would seem not improbable in the light of our recent experience with them, and that the Missouri Indians, who were friendly to the French, treacherously fell upon them, killing all but one man, a priest, who escaped and made his way back to Santa Fe, with the records of the ill-fated expedition and the story of its destruction. Other writers say the Spaniards were annihilated on the Missouri, not one man surviving the slaughter.

The more circumstantial of the old accounts of this tragedy is that of Lieutenant Dumont, whose "Memoires Historiques sur La Louisane" have preserved many interesting historical details of those times. He served in Louisiana and accompanied one of the French enterprises from New Orleans toward the northwest, undertaken in the early decades of the eighteenth century. Dumont says:

"The success of this expedition was very calamitous to the Spaniards. Their caravan was composed of fifteen hundred people, men, women and soldiers, having with them a Jacobin for a chaplain, and bringing also a great number of horses and cattle, according to the custom of that nation to forget nothing that might be necessary for a settlement. Their design was to destroy the Missouris, and to seize upon their country, and with this intention they had resolved to go first to the Osages, a neighboring nation, enemies of the Missouris, to form an alliance with them, and to engage them in their behalf for the execution of their plan. Perhaps the map which guided them was not correct, or they had not exactly followed it, for it chanced that instead of going to the Osages whom they sought, they fell, without knowing it, into a village of the Missouris, where the Spanish commander, presenting himself to the great chief and offering him the calumet, made him understand through an interpreter, believing himself to be speaking to the Osage chief, that they were enemies of the Missouris, and that they had come to destroy them, to make their women and children slaves and to take possession of their country. He begged the chief to be willing to form an alliance with them, against a nation whom the Osages regarded as their enemies, and to second them in this enterprise, promising to recompense them liberally for the service rendered, and always to be their friend in the future. Upon this discourse the Missouri chief understood perfectly well the mistake. He dissimulated and thanked the Spaniard for the confidence he had in his nation; he consented to form an alliance with them against the Missouris, and to join them with all his forces to destroy them; but he represented that his people were not armed, and that they dared not expose themselves without arms in such an enterprise. Deceived by so favorable a reception, the Spaniards fell into the trap laid for them. They received with due ceremony, in the little camp they had formed on their arrival, the calumet which the great chief of the Missouris presented to the Spanish commander. The alliance for war was sworn to by both parties; they agreed upon a day for the execution of the plan which they meditated, and the Spaniards furnished the savages with all the munitions which they thought they needed. After the ceremony both parties gave themselves up equally to joy and good cheer. At the end of three days two thousand savages were armed and in the midst of dances and amusements; each party thought of nothing but the execution of its design. It was the evening before their departure upon their concerted expedition, and the Spaniards had retired to their camps as usual, when the great chief of the Missouris, having assembled his warriors, declared to them his intentions, exhorted them to deal treacherously with these strangers who were come to their home only with the design of destroying them. At daybreak the savages divided into several bands, fell on the Spaniards, who expected nothing of the kind, and in less than a quarter of an hour all the caravan were murdered. No one escaped from the massacre except the chaplain, whom the barbarians saved because of his dress; at the same time they took possession of all the merchandise and other effects which they found in their camp. The Spaniards had brought with them, as I have said, a certain number of horses, and as the savages were ignorant of the use of these animals, they took pleasure in making the Jacobin whom they had saved, and who had become their slave, mount them. The priest gave them this amusement almost every day for the five or six months he remained with them in their village, without any of them daring to imitate him. Tired at last of his slavery, and regarding the lack of daring in these barbarians as a means of Providence to regain his liberty, he made secretly all the provisions possible for him to make, and what he believed necessary to his plan. At last, having chosen the best horse and having mounted him, after performing several of his exploits before the savages, and while they were all occupied with his maneuvers, he spurred up and disappeared from their sight, taking the road to Mexico, where doubtless he arrived."

In a letter written by Charlevoix, the famous and intrepid Jesuit explorer, to the Duchess of Lesdiguieres, from Kaskaskia, Illinois, July 21, 1721, while the brave pioneer was on his way from Quebec to New Orleans, he thus referred to this ill-starred Spanish expedition; his account being materially different from the preceding:

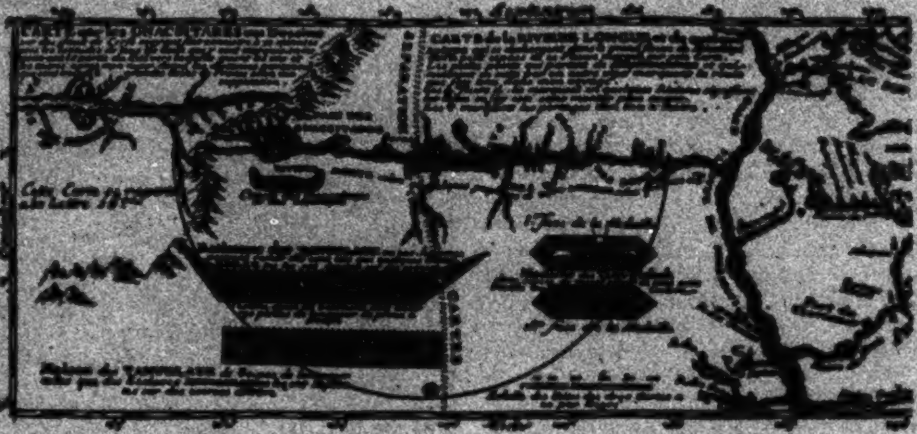
"About two years ago, some Spaniards, coming, as they say, from New Mexico, and intending to get into the country of the Illinois and drive the French from thence, whom they saw with extreme jealousy approach so near the Missouri, came down the river and attacked two villages of the Octoyas [Otoes], who are the allies of the Ayoues [Iowas], and from whom it is said also that they are derived. As the savages had no firearms and were surprised, the Spaniards made an easy conquest and killed a great many of them. A third village which was not far off from the other two, being informed of what had passed, and not doubting but that their conquerors would attack them, laid an ambush into which the Spaniards heedlessly fell. Others say that the savages, having heard that the enemy were almost all drunk and fast asleep, fell upon them in the night. However it was, it is certain that the greater part of them were killed. There were in the party two almoners; one of them was killed directly and the other got away to the Missouris, who took him prisoner, but he escaped them very dexterously. He had a very fine horse and the Missouris took pleasure in seeing him ride it, which he did very skillfully. He took advantage of their curiosity to get out of their hands."

"One day as he was prancing and exercising his horse before them, he got a little distance from them insensibly; then clapping spurs to his horse he was soon out of sight."

In 1722, Bourgmont put in an appearance again, coming up the Missouri river with a considerable force of men, intending to push out into the west from some convenient point on that stream, on the lower reaches of which a few French traders were already establishing themselves. The French were always solicitious about making friends and allies of the Indians, and Bourgmont was authorized to make treaties with all the tribes he encountered; to win them from Spanish influence from New Mexico, and to establish relations with them for a permanent French monopoly of their trade. Bourgmont reached a point on the Missouri not far from the present site of Kansas City by midsummer of that year, and there built a stockade, which he called Fort Orleans, as a base of supplies. He then proceeded up the Kansas river and established another little post somewhere near where Topeka is built. Starting from that point in the autumn, having been delayed by illness, Bourgmont went westward through northern Kansas making treaties with several tribes, and by gifts arranged for safe conduct through the country to the Spanish territory in the southwest; a privilege, however, that he did not use, as he soon started back to the Missouri, abandoning further purposes of his enterprise. From reference in his accounts to tribes dwelling on the Platte in the west, he is believed to have approached near to the eastern boundary of Colorado, and to have been almost in sight of "the mighty mountains," which figured in most of the French stories of the west in that period.

Early in the eighteenth century rumors of a water passage existing between the Mississippi and the great western ocean, by way of one of that river's tributaries, were revived among the French in Canada. They were based on tales told by Indians to French explorers on the headwaters of the Mississippi. Beside this water connection there was supposed to be a great gulf or sea extending eastward from the Pacific and covering a large area in this region. An old map of this period, of which we have an engraving, shows this sea reaching about to the longitude of Denver. On its southeastern coast the old map-maker locates the mythical city of Quivira in latitude and longitude very near those of Denver.

From 1731 to 1745 Verendrye, a French explorer, with a large company, made repeated attempts to find this western connecting water way in the region to the west of Lake Superior. In 1739 another company of French, under two brothers named Mallet, one of whom was a priest, believed they could find it by following the Missouri, which stream they thought to be one connecting through, in some way, to the western sea, and that it was part of the traditional water-way of which they so long had heard. So, they ascended the Missouri, came up the Platte to its forks, and then followed the South Platte past the site of this city, and on southward to the Arkansas river; and it would seem that they also went into the South Park on their way. But by this time the presence of "the mighty mountains" convinced them that if there were a water passage through America to the western sea, it was not to be found in this part of the country.



LaHontan's Map, 1706, showing great waterways east and west from the Rocky Mountains.

After a brief stay on the Arkansas they proceeded to Santa Fe, where they arrived in July, 1739, and remained through the following winter. In May, 1740, they started on their return. The party divided, one portion crossing the plains through southeastern Colorado and on to the Missouri, while the other went down the Arkansas river to the Mississippi and thence to New Orleans,

The statements this south-bound division made upon arrival at New Orleans induced Bienville to revive the Chinese theory, and to assume, or pretend to assume, that some of the regions traversed by the party might have been parts of China, notwithstanding his knowledge of the Spanish people in New Mexico, and the fact that the explorers had come almost directly from Santa Fe—altogether a most singular instance of the persistence of the old Asiatic idea of this continent. Bienville could not rest until he sent an expedition up the Arkansas river to see about it, and which went as far as the Canadian river.

This expedition was under Fabree, and did not accomplish anything of great importance, though it was absent nearly two years. It proceeded up the Arkansas to the mouth of the Canadian river, and then up that stream about one hundred miles, where a kind of fort, named for the commander of the expedition, was built, and where the company remained during the winter of 1741-42. It is to be remembered that these so-called "forts" were very crude affairs, and the ease with which they were built and the frequency of their abandonment, were not a serious drain upon resources.

In the spring of 1742, Fabree left his post and started on his homeward journey. When he came to the mouth of the Canadian he halted, and there on the point of land between it and the Arkansas, he buried at the foot of a large tree a leaden plate bearing the arms of France, enclosing it in a heavy leaden box, as a mark of French occupation of that part of the country. This proceeding was solemnized by ceremonies so dear to the French heart, and after they were over, Fabree and his men went away down the Arkansas valley, and never came back again.

The enterprise of Fabree appears to have been the last French excursion from New Orleans in this direction. His report probably convinced Bienville that there was nothing in the Chinese theory. Furthermore, the Spanish irritation in consequence of these repeated French forays into the debatable land, was becoming intense, and as there was so large an opening for French enterprise and industry in other parts of "Louisiana," the Frenchmen ceased from troubling their Spanish neighbors. The upper country of the Red and Arkansas rivers was, by both peoples, left in the possession of the Indians and the buffalo for many years.

The French belief in a water way through to the Pacific, which grew out of Indian accounts of the large, connected lakes in British North America, lingered for a long time, and did not entirely disappear until the close of that century. Their old maps usually located it in the latitude of North Dakota, along which it stretched its ragged way to the western sea. A map published in Paris as late as 1782 still retained it.

They also clung to the mythical city of Quivira for more than two hundred years after Coronado's long and fruitless march in search of it. All of their old maps of the west down to 1750 gave it place, and all of them located it about where Denver stands.

Until France ceded Louisiana to Spain, her explorers, traders and trappers were busy in the upper west. However, they confined their operations chiefly to the country of the Missouri river, and its tributaries on which they could navigate their bateaux. The river Platte was nowhere favorable for the movements of boats requiring two or three feet of water and, therefore, their kind of traffic on it was altogether impracticable. It was this, more than any other difficulty, that kept the French out of our immediate locality in those early years.

This Denver land has been under the flags of three nations, and under one of them twice; though it might be said it was twice under that of Spain, for as we have seen, Spain asserted her authority over it in the early part of the eighteenth century, and as a practical proposition, she was nearer in possession of it than the French ever were.

LaPotherie's Map of New France, 1722.

But considering things as they were nominally assumed to be, and which made the Arkansas river Spain's northern boundary here in eastern Colorado, this Denver region was French territory from 1682 to 1763; Spanish from 1763 to 1800; and again French from 1800 to 1803-04; and thenceforward a part of the land of the free and the home of the brave.

The first Commandant, or Governor, at St. Louis, may properly be regarded as the first official having jurisdiction over it, though he knew nothing whatever about it. He was Captain St. Ange of the French army, who went to St. Louis in 1765, soon after its founding by Laclede and Choteau, and served until 1770, notwithstanding that "Louisiana" had passed to Spain seven years before, a matter that will be duly considered in our account of the old Province. St. Ange was succeeded on May 20, 1770, by the first Spanish commandant, Don Pedro Piernas, who served until May 19, 1775, when he was relieved by Don Francisco Cruzat, who remained in office to June 14, 1778, when he gave way to Don Fernando De Leyba, who was a very unpopular man, and whose official career was ended by his death in June, 1780.

The official mantle then temporarily rested on the shoulders of Lieutenant Silvio Francisco Cartabona of the Spanish army, who served until the arrival of Cruzat who had been re-appointed to his old position. Cruzat was a sensible man, and in his second term served until November 25, 1787, when Don Manuel Perez, another Spanish officer who made a good record, succeeded him. Perez was in power until 1793, and was then followed by a man without a title, Zenon Trudeau, whose first name is Spanish, but whose second has a decided French flavor. Nevertheless, he was a good enough Spaniard and a good executive. Trudeau held the office till August, 29, 1799, in the meantime having made sincere efforts to arouse the ambition of the people under his rule to enlarge the field of their sluggish business undertakings. His successor was Don Carlos Dehault Delassus, a Frenchman who had become a Spanish subject, and who had commanded a Spanish regiment in Florida.

Though the country passed back to France in 1800, Delassus remained in authority over "Louisiana" until the United States took possession in 1804, and, as will presently be narrated, France never really assumed control of "Louisiana" under its re-cession to her in 1800. The Spanish flag floated over St. Louis, and theoretically over the mouth of Cherry creek, until Governor Delassus pulled it down in March, 1804, and General (then Captain) Amos Stoddard of the United States army, who also acted as agent and Commissioner of the French Republic, ran up the stars-and-stripes.

But during those years of theoretical Spanish rule over this land where Denver stands, it did not make the slightest difference to the kind of people who were careering up and down and around the South Platte river, who was in distant authority over them, nor under whose jurisdiction they were killing buffalo and each other.

While we are on the subject of old-time Commandants and Governors, and at the risk of being somewhat out of chronological order in the narrative, we will include here the names of the American Governors of this region up to the time of the admission of Missouri to the Union, the first of the "Louisiana Purchase" States, proper, Louisiana having been organized as a State from the Territory of Orleans, as will later appear in the course of this story.

At first the country was placed under the temporary command of General William Henry Harrison, then Governor of the Territory of Indiana, with Captain Amos Stoddard as Deputy Governor and Commandant at St. Louis. On October 1, 1804, General Harrison appointed Colonel Samuel Hammond, of Virginia, to succeed Captain Stoddard. On July 4, 1805, General James Wilkinson superseded Hammond as Governor, under a new arrangement which ended General Harrison's connection, and gave the region an executive of its own. In 1807 Merriwether Clark, the explorer, succeeded Wilkinson, and at his death in 1809, his successor was Benjamin Howard. Howard resigned in 1813 and Captain William Clark became Governor. He remained in office until relieved by the State organization of Missouri. The enumeration of all the other Governors whose nominal jurisdiction extended here to the Rocky Mountains in the succeeding years, would be more of an undertaking than is called for in this narrative.

After Spain acquired the "Louisiana" country in 1763, and until the United States purchased it in 1803 there was no progress. What the consequences would have been in that time had French rule continued, lies off in the field of conjecture. But in that interval there were but feeble efforts made to further explore its western parts to ascertain their value and resources. A pall of Spanish lethargy rested upon the whole region, and history-making events practically ceased within its borders.

CHAPTER XI.

The Province of Louisiana—De Soto's Expedition West of the Mississippi—La Salle's Rediscovery of Mouth of the Mississippi, on Which French Claims Were Based—French Settlements in Lower Louisiana—Extensions of French Occupation—Cession to Spain—Outlines of Political History of the Mississippi Valley Region—Purchase of Louisiana by the United States, and Causes Leading Thereto—Acquisition of the Floridas.

Denver is enthroned on the western border, about midway between the southern and northern limits of a territory in which, within its original confines and in the lifetime of the century just closed, have been the scenes of the most magnificent development of civilization and human progress that the world has ever known. In the great natural empire embraced by that territory, man fought his way through countless obstacles, triumphed over nature, and set the stamp of his highest and best endeavors.

The history of the vast region once claimed as the "Province of Louisiana," and which was later known as the Territory of Louisiana, began in years not long after the death of Christopher Columbus in 1506. Passing the somewhat indefinite and unsatisfactory accounts of the early Spanish expeditions through the southwest, the first fairly-well recorded exploration of any part of it, by Europeans, was that of another Spaniard, Hernando De Soto, in 1540-41. He landed at Tampa Bay, on the Florida west coast, in 1539, with a large company of adventurers from Spain, and later made his way through the trackless forests and swamps to the Mississippi, reaching it in the summer of 1541, at a point not far from the Chickasaw Bluffs, though the exact locality is not clearly established. De Soto and his company then crossed the great river and passed the winter of 1541-42 on the Washita river. Their stopping place was on the Washita, in the northern part of the present State of Louisiana, not far from the Arkansas line.

In the spring of 1542, De Soto and his men started on their return toward Florida. The leader had contracted a swamp fever, and when his company reached the Mississippi the disease prostrated him. The party halted on the river's bank, and on June 5, 1542, De Soto died there; the noble stream he had discovered less than a year before receiving his body in the depths of its waters, his men conceiving that to be his most appropriate burial place. Of the subsequent movements of his party some account has already been given in connection with that of Spanish explorations in the southwest.

More than a hundred years passed before another European saw the Mississippi. In 1654, an English officer, Colonel Wood, with a small party, penetrated the wilderness northwest of the Ohio river, and was followed in 1670 by Bolt; but neither of these explorers went as far west as the Mississippi, and neither left any important account of his travels.

The first step toward extending the dominion of France in North America was in the direction of the great region watered by the Mississippi and its tributaries. In 1665, Father Claude Allouez started from Quebec for the western country. He went to the Falls of St. Mary in what is now the eastern part of the upper peninsula of Michigan, and there, at the southernmost point of Lake Superior founded a mission. French traders and trappers had been in lower Michigan and Wisconsin more than forty years earlier, but no permanent occupation had been made. A temporary mission had been established near Allouez's location, in 1641, but was soon abandoned. In 1659, the traders, accompanied by adventurous missionaries, penetrated the region around the western end of Lake Superior; but the mission of Father Allouez was the first permanent settlement on the shores of that inland sea.

Allouez remained at this mission two years, when he returned to Quebec to enlist others in his undertaking. This he readily succeeded in doing, and with his recruits immediately went back to Lake Superior.

Among those who accompanied Father Allouez to the new country were Father Jacques Marquette, and Louis Joliet. Soon after his arrival in the west, Marquette learned from the Indians that a great river flowed in the region nearer the setting sun, and he determined to explore the stream. After acquiring some knowledge of the Indian languages he set out on his expedition in 1673, accompanied by Joliet and five other Frenchmen.

Leaving St. Ignace, on the Strait of Mackinac, where Marquette had established a mission in 1671, the party went westward, along the southern shores of Lake Superior, and thence across to the headwaters of the Wisconsin river. Here they constructed a large bateau in which they voyaged down the Wisconsin. On the seventh day they entered the Mississippi, an event which Marquette celebrated with religious fervor characteristic of the devoted French missionaries wherever they were and whatever they were doing. Marquette proceeded down the Mississippi as far as the mouth of the Arkansas river, and then turned back, on his homeward voyage, stopping at several places to explore the country adjacent to the great stream.

Early in 1682, Robert, Chevalier, Sieur De La Salle navigated the Mississippi from the Illinois river to the Gulf of Mexico. But little is known of his earlier career. He had been in the region of the great lakes for several years prior to his Mississippi voyage. In 1680, he went to the Illinois river country, the King of France having authorized him to make further explorations in the west. When he reached Lake Peoria he determined to build a sail vessel in which to explore the Mississippi by way of the Illinois, having previously built the first one that had sailed the great lakes. Before finishing this boat he decided that it would be impractical on the rivers, and concluded that he would use canoes or bateaux.

So, having in the meanwhile been joined by Fathers Hennepin and Membre, and by De Tonti and Dautray, he started with his company down the Illinois river in February, 1682. On February 14th the explorers entered the Mississippi and paddled away on their historic voyage, which ended in the Gulf of Mexico, on April 7th. They stopped frequently to make friendly visits with the Indians, but in his report of the expedition La Salle mentions nothing of any importance occurring while on the way, until he reached a place he calls Tangibao where, he says, a tremendous battle had just been fought by rival Indian tribes. After passing this sanguinary town, the explorers continued their voyage forty leagues, and on the 6th of April saw that the river was divided into three branches. The next day, April 7th, La Salle reconnoitered the right channel; sending De Tonti to follow the middle branch, and Dautray the left. At the end of two leagues they found salt water, and a little while after emerged into the open sea. They then retraced the same channels and, upon reassembling, congratulated each other with extreme joy in having so happily achieved so great an enterprise. On the 9th of April La Salle caused to be erected the Arms of France, and after having sung the hymn Vexilla Regis, and the Te Deum, he took possession of the river in the name of his King, and of all the rivers which entered it, and of all the country they watered. Then he caused to be made an authentic act, signed by all his people, and, after a discharge of guns, he placed in the ground a plate of lead with the Arms of France upon it, and upon which the names of those who made the discovery were engraved. He then named the great region of which he had thus taken possession, "Louisiana," in personal honor of the French monarch, Louis XIV. This was the beginning, nominal though it may have been, of civilized authority in the southern part of the Mississippi valley.

One of La Salle's chroniclers says he proclaimed the name "Louisiana" in a loud voice, and declared its extent to be—

> "From the mouth of the great river St. Louis, on the eastern side, otherwise called the Ohio, Alighin, Sipore, or Chiskagona, and this with the consent of the Chaonanons, Chikachas, and other people dwelling therein with whom we have made alliance, as also along the river Colbert, or Mississippi, and rivers which discharge themselves therein, from its source beyond the Kious or Nadongesious, and this with their consent, and with the consent of the Montanties, Illinois, Mesigamens, Natches, Koroas, which are the most considerable nations dwelling therein, with whom also we have made alliance * * * as far as its mouth at the sea or Gulf of Mexico * * * and also to the mouth of the river Palms, upon the assurance which we have received from all these nations that we are the first Europeans who have descended or ascended the said river Colbert."

La Salle named the Mississippi the "River Colbert," in honor of his friend and patron M. Colbert, the Colonial Minister under Louis XIV, and upon whose report the King conferred on La Salle the rank of "Esquire" with power to acquire Knighthood. In addition to the names the explorer assigned to the Ohio, it was also called the "Ouabache"—Wabash. The name "Colbert" did not stick to the Mississippi, as the French soon renamed it the "St. Louis" in honor of their monarch.

It is a fact curious enough to deserve mention, that this vast region to which La Salle thus laid claim is almost identical with that once occupied by the ancient race of "Mound Builders."

In this year—1682—a trading post had been established by French adventurers, with a mission by the Jesuits, on the Illinois river. In 1700 it was removed to a point two miles from the Mississippi, below the site of the modern city of St. Louis, and from it the old town of Kaskaskia, Illinois, dates its founding.

La Salle immediately returned to France, where, under the auspices of the French government, he fitted out an expedition of four vessels and about three hundred people, well equipped. While ostensibly for the purpose of founding a colony at the mouth of the Mississippi, it was in fact, intended to be the nucleus of a French military enterprise against the Spaniards in Mexico, who were suspected of possessing gold and silver mines in that country, of fabulous richness. In those days it was considered proper to plunder a neighbor who had anything worth taking.

La Salle sailed from France in July, 1684, with soldiers for a large part of his company, and after an uneventful voyage, at the end of which he carefully avoided the mouth of the river, landed on the shores of Espirita Santa Bay—later known as Bay St. Louis, or St. Bernard Bay—an indentation of the coast of Texas, west of Galveston. Here he started a settlement which he named Lavaca, and built a fort after the fashion then prevailing in the wilderness. For more than two years little else was done. The soldiers and colonists dwindled away, and in January, 1687, La Salle with a portion of his force set out by land for Canada to obtain relief. He was a harsh, arbitrary man, and on March 19, 1687, near the Trinity river, in Texas, was assassinated by two of his embittered and exasperated followers. Some of the company afterward perished in the swamps and forests, while others eventually succeeded in getting through to Canada, and returning to France. Of those left behind on the Gulf coast, nearly all were cut off by the Indians, and the few survivors were rescued by a Spanish force that had been sent to rout out the settlement and its fort—seemingly an instance of righteous and magnanimous retribution. The French made no further attempts to establish themselves in that region, and it was not afterward successfully maintained by France that the Province of Louisiana extended west of the Sabine river, now part of the eastern boundary of Texas.

PART OF MAP BY HERMAN MOLL, ENGLISH GEOGRAPHER, PUBLISHED IN LONDON ABOUT THE YEAR 1710.

La Salle's enterprise was beset by many difficulties at Espirita Santa Bay, and its unhappy fate, together with the sorry tales of the few survivors who got back to France, had a discouraging influence. It was not until 1699 that the next organizations of French—peaceful and fairly honest colonists this time—under the leadership of Iberville, reached the new country, the leader formally disembarking to the mainland on February 27, 1699. They made settlements on Ship Island, and Cat Island (both now belonging to the State of Mississippi), on the main land at the eastern side of Biloxi Bay, at Bay St. Louis—the second one of this name—and at Mobile. Biloxi became the first capitol of the new Province of Louisiana.

These several colonies for some reason failed to have satisfactory prosperity, and, in 1712 the King of France granted the Sieur Antoine Crozat a charter, which was to be in force fifteen years, and which gave him a monopoly of the commercial privileges of nearly the entire valley of the Mississippi, and practically made him ruler of the region.

By this grant, Louis XIV established a system of jurisprudence for the territory, consisting of edicts, ordinances, and customs of Paris, which was held to embrace the civil law in cases not covered by those customs; and empowered Crozat—

"To carry on a trade in all the land possessed by us and bounded by Old and New Mexico on the west, and by the English of Carolina on the east, upon the River St. Louis heretofore called the Mississippi, from the edge of the sea as far as the Illinois [both the French and the Spaniards called the Illinois river country "the Illinois"], together with the River St. Phillips heretofore called the Missouri, and the River St. Jerome heretofore called Ouabache [both the Ohio and Wabash had this name at that time] with all the countries, territories, lakes within land, and the rivers which fall directly or indirectly into that part of the River St. Louis. Our pleasure is that all of the aforesaid lands, streams, rivers and islands be and remain comprised under the name of the Government of Louisiana."

Crozat's management brought no improvement, the colonies continuing to languish. In 1717 he surrendered his charter and the King granted another, with greatly enlarged, and additional, privileges to the Mississippi Company—the famous "Mississippi Scheme"—with John Law as Director-General, and Jean Baptiste Lemoyne De Bienville as Civil Governor of the colonies. The city of New Orleans was founded the next year, 1718, by Bienville, and the capital of the Province removed thither in 1723, from Biloxi, which then quickly went to decay.

John Law was born in Edinburgh in 1671, developed as a financier-adventurer in London, and organized the Mississippi Scheme in France in 1717. In English history it is often called the "Mississippi Bubble," and upon its collapse, as collapse it speedily did, a great financial panic was precipitated in France, and thousands of French and English investors were beggared. Law fled from France bearing with him the reputation of having been the greatest confidence man the world ever knew; a distinction which still attaches to his unhallowed memory. Law's charter made him an autocrat over the country in which his company operated.

Under this management the rich alluvial lands along the Mississippi began to be occupied; tobacco, rice and indigo were cultivated, and African slaves introduced. In two years the collapse of Law's company occurred, and the Louisiana colonists were sorely embarrassed, many of them going down in the wreck and ruin it occasioned. In 1732 representatives of the bankrupt company surrendered its franchises to the King and thus finally ended its career. At this time the colonists and their slaves numbered about seven thousand. De Bienville remained as Governor until 1740 when he was superseded by the Marquis De Vaudreuil.

In 1762, while engaged in war with England, France by a secret treaty concluded on November 3rd, and formally ratified on November 13th of that year, ceded the larger portion of her Province of Louisiana to Spain.

The particulars of this treaty were never publicly known in the United States until seventy years after, and until published, in 1837, in the appendix to Gales & Seaton's Reports of Debates, Twenty-fourth Congress. This partly accounts for the misunderstandings among so many of our public men in the time of Jefferson's administration, as to the exact territory which belonged to either France or Spain. The treaty included all of the territory claimed by France west of the Mississippi, and the town of New Orleans with a considerable district on the east side of the river. This New Orleans district was referred to as the "Island of New Orleans."

This "island" was formed by the River Iberville debouching from the Mississippi a few miles above New Orleans and flowing southeasterly to Lake Maurepas, whence its waters by a connecting channel flowed into Lake Pontchartrain, and thence into the Gulf. In times of high water the Iberville was a river; at low water it was a nearly dry channel; so the "island" did not always exist. Whatever other territory France thought she might claim down there on the east side of the river, she retained, if there should prove to be any; but none of them definitely understood much about their actual boundary lines.

The French colonists at New Orleans and elsewhere down there violently opposed the cession and never became reconciled to Spanish authority. For some unknown reason Spain did not assume full possession of her new territory until August 17, 1759. Why France made this secret treaty was never clearly understood, though it later appeared probable that it was because of her impending misfortunes associated with the war with England then going on, and which turned out badly enough for her.

By the treaty of Paris in 1763, which formally ended the war in America between them, France ceded to Great Britain the Canadas, and all her Mississippi possessions east of that river, from its source in the north to the Gulf of Mexico, excepting the district around New Orleans, which had been included in the secret cession to Spain. The western boundary of the territory thus ceded to England was described as follows:

> "A line drawn along the middle of the River Mississippi from its source to the River Iberville (or the Ascantia), thence by said river through Lakes Maurepas and Pontchartrain to the sea."

The title of France to the region she thus ceded to England was not a clear one; not undisputed, at any rate. The English colonies on the Atlantic claimed nearly all of it. Virginia held that all of the present State of Kentucky, and the larger portion of the territory east of the Mississippi and north and northwestward of the Ohio river, were hers by virtue of her colonial charters from the British crown. The first of these was to Sir Walter Raleigh, in 1584, to all the land he could find; the next to the Virginia Colony, in 1606; and the next to the London Company in 1609; the latter two covering the country "from sea to sea." Under this authority, and because of some random attempts to occupy portions of the region, she claimed all south of a line drawn from the point where the Ohio river turns into Pennsylvania, due west to the Mississippi river; but no permanent English settlements had yet been established in it.

Right above this, another belt was claimed by Connecticut, from the Pennsylvania line to the Mississippi river. Its northerly boundary was about the present northern line of the State of Illinois, if extended eastward. The district included half of Lake Erie and clipped off a strip from what is now the State of Michigan.

Next above this Connecticut district, Massachusetts located her shadowy claim. It was a belt wider than that of her next neighbor, with its eastern boundary on the lower part of Lake Huron, the St. Claire river, Lake St. Claire and the Detroit river down to near the northwest limit of Lake Erie. It extended due west across Lake Michigan to the Mississippi. Had Massachusetts held on, she would now possess the cities of Detroit and Milwaukee.

North Carolina assumed that by virtue of her charter from King Charles II, in 1663, her domain also extended west to the "South Sea," and that she certainly owned what is now the State of Tennessee.

Georgia, under her charter, claimed all that was west of her between the thirty-first and thirty-fifth degrees of latitude, which, she assumed, marked the southern and northern limits of her colonial territory.

South Carolina did not agree with Georgia, but insisted that she owned a narrow strip, some twelve or fourteen miles wide, extending from her northwest corner, along under North Carolina's district, out to the Mississippi, and probably much farther—a sort of lane or back road to the "South Sea."

All these colonial charter claims were based on the most vague conceptions of what they really meant. When they were first set up nobody knew a great deal about the "South Sea" or could tell where would be the best place to hunt for it. After the Mississippi was learned to be a great river with a general course from the north to the south, and which cut the vast western country in two, it was taken as the definite western boundary of these colonial territories, with the reservation that this western boundary would be moved on to the "South Sea," regardless of the claims of others, as soon as the whereabouts of that body of water could be more definitely ascertained. This would have made the territories of these colonies a series of narrow strips, in width equal to their north and south dimensions, stretching across the continent, with Pike's Peak ornamenting Virginia territory.

However, these matters were now family affairs between England and her colonies; and France, having terminated her interest, temporarily at least, in North American real estate, gave little heed to the contentions.

This year 1763 also brought a settlement of affairs between England and Spain. These two nations had been at war, and Great Britain had captured Havana and the Island of Cuba. Spain had held Florida, proper, by virtue of its discovery by Ponce De Leon on Easter Sunday in 1512. Its western boundary was the Perdido river—as it is today, which divided it from "West Florida," which latter extended along the Gulf coast south of the thirty-first parallel, from the Perdido river west to the Mississippi, except where the "Island of New Orleans" interrupted it. It is now included in the southern parts of the States of Alabama, Mississippi, and Louisiana.

Spain claimed "West Florida" on two grounds: one, that it was really part of her Florida; and the other, that if it were not, it certainly was a part of the Province of Louisiana which she had acquired from France by the secret treaty of the previous year.

So, in the settlement Spain ceded to England "all that Spain possesses on the continent of North America to the east or to the southeast of the River Mississippi," excepting the "Island of New Orleans" which, with her recent cession from France of the Louisiana territory west of the Mississippi, she retained. In return for this, Great Britain ceded Havana and Cuba to Spain, and England now had both of the Floridas, whatever their territory was, and all that remained of the original Louisiana, under La Salle's broad claim, that lay east of the Mississippi, excepting the "Island of New Orleans."

Soon after Great Britain acquired "West Florida," a new northern boundary was fixed for it on a line drawn eastward from the confluence of the Yazoo river with the Mississippi—about the latitude of Vicksburg—to the west boundary of the colony of Georgia; an arrangement which afterward made some trouble.

During the war of the American Revolution, "West Florida," being far removed from the strife, remained undisturbed until 1779. Spain, too, was then on bad terms with England, and Don Barnardo De Galvaez, Spanish Governor of Louisiana, aided by sympathizers with the American colonists, quietly took possession of "West Florida" in that year on behalf of the King of Spain. In 1781, he went over and captured Pensacola, in Florida, proper, having previously taken Mobile, also.

Having had enough trouble on this continent, Great Britain in 1783 made peace all around. Spain owned the Bahama Islands, and in exchange for them, England re-ceded the two Floridas to her, most of which the Spaniards were holding by capture, anyway.

By the peace treaty of that year between the United States and Great Britain, the United States came into possession of everything east of the Mississippi that was the part of Louisiana acquired by England from France in 1763, from the river's remotest northerly source, down to the thirty-first parallel of north latitude, according to the American understanding of the situation; and Spain now had all the other side, the "Island of New Orleans," the two Floridas, with the thirty-first parallel as the northern boundary of West Florida. This gave her complete possession of the Mississippi for nearly three hundred miles above its mouth, measuring by the river's windings.

But Spain now claimed more than this. She insisted that the north line of "West Florida" was now the Yazoo river line established by the British soon after they had acquired the country from her by the treaty of 1763, and that that was the north boundary she received by the very recent re-cession of the country by England to her. The United States stuck to the thirty-first parallel, and this left the district between that parallel and the latitude of the Yazoo's mouth, to be wrangled over by the two nations for nearly fifteen years. Finally, after many tedious negotiations, Spain, always slow, by treaty of October 27, 1795, relinquished her claims, and turned the disputed region over to the United States. But she still held all the west side of the Mississippi, and the east side south of the thirty-first parallel.

Congress at once formed the region lying between the thirty-first parallel and that of the Yazoo river, into the Territory of Mississippi, extending eastward from the Mississippi to the Chattahoochie river, the latter being the west boundary of the colonial State of Georgia. This State now came forward, when all the trouble was supposed to be settled and done with, and claimed that the whole of the district which had just been constituted the Territory of Mississippi, belonged to her, and that she intended to have it.

In 1802 Georgia surrendered all her claims to territory west of her present boundaries, to the general government, for a consideration, and in 1804 Congress extended the limits of Mississippi Territory northward to the thirty-fifth parallel; the south line of the State of Tennessee. North Carolina had, in 1790, ceded her interests in that Tennessee region to the government, and it had been admitted as a State of the Union in 1796. South Carolina had given up her lane to the Mississippi in 1787, and all these family matters down there were now straightened out.

That part of the Province of Louisiana lying west of the Mississippi, has a history scarcely less picturesque than that of the eastern, to follow which we will now have to go back a few years.

After possessing it for more than thirty years, Spain gave it up. By the treaty of St. Ildefonso, in 1800, between France and Spain, France again came into possession of all of Louisiana west of the Mississippi, and with it the "Island of New Orleans" east of the river. This was the same domain she had secretly transferred to Spain in 1762. New Orleans was a thrifty town of some twelve thousand people, and the capital of the Province. Many promising settlements had been made elsewhere. Those of St. Genevieve and New Bourbon on the Mississippi below St. Louis had been established in 1763, though some authorities sustained by traditions say they date from 1735. They were the pioneer settlements in what is now the State of Missouri. St. Louis' site was decided on in 1763, and in 1764 the first houses were built. At numerous other places along the great river, beginnings were made in 1800.

Three years later, in 1803, Napoleon Bonaparte, then First Consul of the French Republic, anticipating that he might be unable to hold the Territory, and wishing to prevent it falling into England's possession, sold it to the United States for fifteen millions of dollars.

The negotiations for it were instituted, carried forward and consummated under the direction of President Thomas Jefferson. He was most vigorously denounced by his partisan opponents for the act. It was usurpation, an outrage on the people, unconstitutional, a shameful waste of public money, everything that was bad and nothing that was good. Even some of his political associates hesitated about indorsing a transaction so extraordinary. But indorsed it was, and France ceded the Territory to the United States. Mr. Jefferson probably went outside a strict construction of his official prerogatives, but if he did, it was one of those rare instances in high places, in which such an end justified the means, though much personal detraction and abuse were heaped upon him.

President Jefferson had little conception of the enormous value and possibilities of the great land he had bought. The area of the region lying between the Mississippi and the Pacific ocean was approximately known, but the boundaries of Louisiana Territory were vaguely laid down on the maps, and nobody knew much about them very far away from New Orleans. The explorations had been few and unsatisfactory, and the region was held to be mainly a dreary, inhospitable desert. Mr. Jefferson's chief object in making the purchase was to secure control of the Mississippi river from one end to the other. France held the west side of it from its source to its mouth, and the "Island of New Orleans" on the east; while Spain's "West Florida" bordered on the east side south of the thirty-first parallel down to the "island." Thus was the majestic stream blockaded against the American territory along its eastern bank to its northern sources.

PAYS DES APACHES ET DES PADOUCAS
GOLFE DU MEXIQUE

DeLisle's Map of "Louisiana," about 1740.

Included in the cession to the United States by Great Britain, under the treaty of 1783, at the close of the Revolution, was the vast domain east of the Mississippi and northward of the Ohio river. This was part of the enormous region included in La Salle's broad claim when he took possession of "Louisiana" in 1682; and so was the larger portion of that out of which the States of Kentucky and Tennessee were formed. Virginia, Connecticut and Massachusetts had laid claim to nearly the whole of it by reason of their English colonial charters, which had generously granted them all the country to the westward of their Atlantic borders. It is doubtful if any Massachusetts man, up to this time, had ever set foot on any part of the district she claimed. However, they had ceded their interests in the region to the general government; Virginia in 1784, Massachusetts in 1785, and Connecticut in 1786.

Congress, by the memorable Ordinance of 1787, had created there the Northwest Territory, in which slavery was forever prohibited; being our first national anti-slavery legislation. Out of this Territory of Freedom afterward came the five great States: Ohio, 1802-03; Indiana, 1816; Illinois, 1818; Michigan, 1837; and Wisconsin, 1848. This division left a small section in the extreme northwest which was afterward attached to Minnesota. Virginia's connection with the Kentucky region had been severed by cutting off Kentucky, and admitting it as a State in 1792; the same disposition had been made of North Carolina's claims upon Tennessee, in 1796; and Ohio had just entered the Union.

With three new States in the west and several more almost within view, Mr. Jefferson, with rare judgment and foresight, saw the imperative necessity of the United States owning and controlling the Mississippi river. Had he done nothing else to immortalize himself in the history of his country, this one act was sufficient to elevate him to an imperishable fame.

Spain opposed the purchase by what was for her an extraordinary manifestation of vigor, but to no purpose. She feared the consequence of such an expansion of American territory, and probably foresaw that it rendered her hold on the two Floridas extremely precarious. There was in France, too, much opposition to the cession, and after the terms and conditions had been agreed upon in Paris, Mr. Livingston, the American Minister to France, wrote Mr. Madison, Secretary of State, as follows:

> "I hope in God nothing will prevent your immediate ratification without altering a syllable of the terms; if you wish anything changed, ratify unconditionally, and set on foot a new negotiation. Be persuaded that France is sick of the bargain, and that Spain is much dissatisfied, and the slightest pretense will lose you the Treaty."

The treaty was concluded and executed at Paris on April 30, 1803, and immediately transmitted to the United States. Owing to the slow means of communication at that time, the documents did not reach Washington until July 14th.

The treaty was ratified on this side November 1, 1803, but it was not until February 10, 1804, that Spain, through her Minister of State, Don Pedro Cavallas, formally withdrew her opposition to the cession, in a communication from him to Mr. Pinckney, United States Minister to that country.

Before entering further into details of the Louisiana Purchase, we will now briefly digress and consider some dealings with Spain which followed. There was so much confusion and misunderstanding on this side of the ocean as to what territory France had acquired by the treaty of St. Ildefonso, that the American envoys at Paris thought the Louisiana they had bargained for included more on the east side of the Mississippi than merely the "Island of New Orleans." The non-committal, if not misleading, statements of Talleyrand, which we will quote later, were partly responsible for this. However, our people soon discovered their error, and found that Spain claimed to be the owner of all of the two Floridas, with boundaries as the Spanish-American treaty of 1795 had defined them.

Early in 1804, the United States attempted to negotiate with Spain for a settlement of all questions relating to the territory of the two nations, bordering on the Gulf; and for the purchase of "West Florida," or a re-adjustment of its boundaries that would give us more territory down there east of the Mississippi. Our people contended that the country from the Perdido river on the east, thence west and southwest along the coast, to the river Bravo del Norte, with all the intermediate rivers, and all the countries drained by them not previously acquired by the United States, were intended to be and were included in the purchase of 1803 from France. But Spain denied our rights to anything east of the Mississippi except New Orleans and the "island," and would not say, specifically, how far the Province of Louisiana had extended along the coast west of the river. She also declined to consider the American propositions as subjects for treaty.

On February 24, 1804, Congress by law provided for imposing and collecting duties in all this disputed territory, and on March 26th, the same year, an act was passed organizing the Purchase into two Territories; a part west of the river, about what is now there embraced in the State of Louisiana, the "Island of New Orleans," and the "West Florida" region, to constitute the Territory of Orleans; the remainder of the Purchase, to the north and northwest, wherever it might extend, to constitute the Territory of Louisiana. But Spain was still in possession of "West Florida" and remained so for several years longer, but was not in possession of any portion of that part of Orleans Territory west of the Mississippi.

On October 27, 1810, the inhabitants of this "West Florida" country declared their independence of Spain and notified President Madison of their action. On October 27, 1810, the President issued a proclamation asserting the claims and rights of the United States to the region, directing the Governor of the Territory of Orleans to take possession of it as far east as the Perdido river—its nominal eastern boundary, and followed the proclamation with troops which dispossessed Spain and took military possession of the district, Governor Claiborne assuming authority over it on December 7, 1810.

This was a rather dubious proceeding, to say the best of it. The proclamation virtually declared that the United States would seize and hold the country, and talk about it and treat for it with Spain afterward. The transaction has been in later times much criticised, and is regarded by many as having been discreditable to the United States, as we were not then at war with Spain, and the region, whether fairly or not, was in dispute. However, once done it was not undone, notwithstanding the vigorous protests against the act, by Mr. Morier, the British Minister at Washington.

On April 8, 1812, when the cloud of our second war with England was showing itself above the horizon, the State of Louisiana was admitted to the Union. Its limits definitely comprised all of Orleans Territory west of the Mississippi, and the "Island of New Orleans" on the east, leaving "West Florida" hanging in the air for a few days. The people of New Orleans insisted that "West Florida" had belonged to the old Province, and persisted in demanding at least a part of it. In this claim the residents of the disputed region joined, and therefore Congress directed the Legislature of Louisiana to assume control, temporarily, over the western end of it adjacent to New Orleans, which was immediately done.

On April 14, 1812, six days after its admission, Congress enlarged the area of the new State of Louisiana, so as to include more of the "West Florida" district, and which gave the State her present lines east of the Mississippi. On May 14, 1812, Congress annexed what was left of the "West Florida" district to the Territory of Mississippi, and the remnant of that Territory of Orleans with its brief but picturesque career, passed off the map and out of existence.

This Mississippi Territory, with its queer patchwork of history, afterward became the land of two States—Mississippi and Alabama. When Mississippi was admitted in 1817 with its present boundaries, what was still left of the former "West Florida" region became part of Alabama Territory; and when Alabama became a State in 1819, the last vestige of buffeted and kicked-about "West Florida" disappeared.

Spain had noisily protested against all these proceedings—and it must be admitted that they were high-handed—but to no purpose; and continued lamenting her despoilment for several years. On February 22, 1819, yielding to the demands of the United States, she concluded a treaty by which she ceded to us whatever she had left in both the Floridas for considerations aggregating about six and one-half millions of dollars. The King of Spain was slow in ratifying it, but finally did so with much reluctance. Florida became a State in 1845.

In subsequent litigation between individuals the question of national ownership of the disputed territory arose and passed to the Supreme Court of the United States for final decision. In an opinion delivered by that Court, Chief Justice John Marshal said:

> "After these acts of sovereign power over the territory in dispute, asserting the American construction of the treaty by which the Government claims it, to maintain the opposite construction in its own courts would certainly be an anomaly in the history and practice of nations. If those departments which are intrusted with the foreign intercourse of the nation which assert and maintain its interests against foreign powers have unequivocally asserted its rights of dominion over a country of which it is in possession, and which it claims under a treaty; if the legislature has acted on the construction thus asserted, it is not in its own courts that this construction is to be denied. A question like this, respecting the boundaries of nations is, as has been truly said, more a political than a legal question; and in its discussion the courts of every country must respect the pronounced will of the legislature."

The doctrine of this decision has been maintained by the United States from that day to this.

These varied processes of discovering, claiming, ceding and ceding back again, buying, selling, capturing, grabbing, seizing and dividing, finally obliterated all that part of the great Province of Louisiana east of the Mississippi, originally claimed by La Salle for the King of France, and so much of it on the west side of the river as the State of Louisiana includes in its present limits. The inhabitants, particularly those of the southeastern portions, must have had a hard time of it trying to keep track of their frequently shifting allegiance.

CHAPTER XII.

Outlines of Negotiations for Louisiana—Opposition to the Purchase—Transfer of the Province—Subsequent Divisions of Louisiana Territory—Its Extent and Boundaries—The Oregon Country—Other Territorial Accessions in the West—Wonderful Development of the Vast Western Domain.

At the outset President Jefferson and his counselors did not contemplate purchasing from France more than the "Island of New Orleans" and a portion of "West Florida" which they supposed to be, in part, at least, an attachment of Louisiana. When the Americans earnestly opened the negotiations at Paris, they found to their surprise and pleasure, that Napoleon was willing to sell the whole of the great territory.

The instructions of the American envoys, as finally decided on, had been to "procure * * * a cession to the United States of New Orleans and of West and East Florida, or as much thereof as the actual proprietor can be prevailed upon to part with." It was also proposed that "the navigation of the river Mississippi, in its whole breadth from its source to the ocean, and in all its passages to and from the same, shall be equally free and common to citizens of the United States and of the French Republic." If the Floridas could not be obtained, the envoys were next to try to buy the "Island of New Orleans;" and if all of that could not be had, they were to secure enough territory at or near the mouth of the Mississippi on which to build a large commercial city and port.

The critical condition of affairs between England and France had reached the breaking point, the vast naval power of England, a portion of which was then lying in wait in the West Indies, made it plain to the First Consul that if he did not at once sell the country he would quickly lose it to Great Britain. With these circumstances confronting him he said to his confidential ministers:

> "They [the English] shall not have the Mississippi, which they covet. * * * The conquest of Louisiana would be easy if they only took the trouble to make a descent there. I have not a moment to lose in putting it out of their reach. * * * I think of ceding it to the United States. * * * They only ask of me one town in Louisiana, but I already consider the colony as entirely lost; and it appears to me that in the hands of this growing power it will be more useful to the policy, and even to the commerce, of France, than if I should attempt to keep it."

As the American envoys had been authorized to buy only New Orleans and the whole or part of the Floridas at a price not exceeding two million dollars, their surprise on learning this may be imagined.

Napoleon had determined to sell Louisiana and, notwithstanding the diplomatic indifference affected in 1802, when it was first suggested by the United States, was now anxious to sell, and this brought the negotiations rapidly to a close. The preliminary advances made by Mr. Livingston in that year, had been received in a manner causing him so much discouragement that he declared to Mr. Monroe upon the latter's arrival:

> "Only force can give us New Orleans! We must employ force. Let us first get possession of the country and negotiate afterwards."

That Mr. Jefferson contemplated seizing New Orleans in the event of failure to purchase it, is shown by the following extract from his later instructions to Mr. Livingston, which also shows that an Anglo-American alliance was then contemplated:

> "The day that France takes possession of New Orleans fixes the sentence which is to restrain her forever within her low-water mark. It seals the Union of two nations who in conjunction can maintain exclusive possession of the ocean. From that moment we must marry ourselves to the British fleet and nation. * * * This is not a state we seek or desire. It is one which this measure, if adopted by France, forces on us as necessarily as any other cause, and by the laws of nature, brings on its necessary effect."

France had not yet taken possession of New Orleans and Louisiana under the treaty of St. Ildefonso, and "this measure" referred to by Mr. Jefferson, was that treaty and the occupation of the Louisiana country by France, under it. Spain was still in possession and authority at New Orleans, and remained in control, practically up to the time the United States acquired the country, as we shall presently relate.

When France had again acquired the Province by re-cession from Spain in 1800, the First Consul conceived plans for a great French colonial empire in America, but these ambitions failed of fruition. The Spanish people in the territory were very offensive and troublesome to their French neighbors, France was involved in grave difficulties with England, war between them was impending, and British vessels were threatening New Orleans.

At the outset of the active negotiations, Barbe-Marbois, with frankness uncommon at such times, said to Livingstone and Monroe:

> "We should not hesitate to make a sacrifice of that which is about slipping away from us. War with England is inevitable. Shall we be able with inferior naval forces to defend Louisiana against that Power?"

Although the First Consul's preliminary "asking price" was one hundred million francs, as he earlier stated to Barbe-Marbois, he was prepared to take an even less price than was eventually agreed upon. Marbois, in his history of the transaction, states that just prior to the arrival of James Monroe in Paris, Napoleon confidentially said:

> "I renounce Louisiana. It is not only New Orleans that I will cede; it is the whole colony without any reservation. I know the price of what I abandon, and have sufficiently proved the importance that I attach to this province, since my first diplomatic act with Spain had for its object its recovery. I renounce it with the greatest regret. To attempt obstinately to retain it would be folly. I direct you to negotiate this affair with the Envoys of the United States. Do not even await the arrival of Mr. Monroe; have an interview this very day with the Envoys of the United States. But I require a great deal of money for this war, and I would not like to commence it with new contributions. For a hundred years France and Spain have been incurring expenses for improvements in Louisiana, for which its trade has never indemnified them. Large sums which will never be returned to the Treasury, have been lent to companies and to agriculturists. The price of all these things is justly due to us. If I should regulate my terms according to the value of these vast regions to the United States, the indemnity would have no limit. I will be moderate in consideration of the necessity in which I am, of making a sale. But keep this to yourself. I want fifty millions [francs] and for less than that sum I will not treat; I would rather make a desperate attempt to keep these fine countries. To-morrow you shall have full powers."

The negotiations were conducted and concluded by statesmen of world-wide reputation; on the side of France by Napoleon, Talleyrand and Barbe-Marbois; and on the part of the United States by President Jefferson, James Madison, then Secretary of State, Robert R. Livingston of New York, who was then the United States Minister Plenipotentiary to France, and James Monroe, who was appointed by the President as Minister Plenipotentiary and Envoy Extraordinary for the special purpose of assisting in the negotiations. The negotiations at Paris were mainly carried on by Talleyrand on the part of France, and by Mr. Livingston and Mr. Monroe on the part of the United States. For the final negotiations and acts, Napoleon had substituted Barbe-Marbois, Minister of the Public Treasury, in the place of Talleyrand, because he was afraid the latter would be bribed by the British government to defeat the proposed treaty.

When Livingston first addressed Talleyrand on the subject, that Minister responded verbally, according to Livingston's account:

> "He told me he would answer my note, but that he must do it evasively, because Louisiana was not theirs."

Even when questioned as to the eastern boundary, after the treaty was concluded, Talleyrand gave evasive answers. "What are the eastern bounds of Louisiana?" asked Livingston. "I do not know," replied Talleyrand; "you must take it as we received it." "But what did you mean to take?" asked Livingston. "I do not know," answered Talleyrand. "Then you mean that we shall construe it our own way?" suggested Livingston; to which Talleyrand finally said: "I can give you no direction. You have made a noble bargain for yourselves, and I suppose you will make the most of it."

There appears to have been some shuffling on the part of Spain in her connection with the affair. When she made the re-cession to France in 1800, she probably included "West Florida," for the clause in the St. Ildefonso treaty subjecting the transfer to treaties she had made with "other States," presumably related to the one made between Spain and the United States in 1795, by which the boundary between "West Florida" and the United States was agreed upon. At that time our territory did not touch the Gulf of Mexico at any point. From this view of the matter, Spain's later claims to "West Florida" would seem to have been clouded.

The language of the first article of the treaty so far as it relates to the territory ceded to the United States, is as follows:

> "Article I. Whereas, by Article III of the Treaty concluded at St. Ildefonso, the 9th Vendemiaire, An.9 (1st Oct., 1800) between the First Consul of the French Republic and his Catholic Majesty, it was agreed as follows:—
>
> "His Catholic Majesty promises and engages on his part to cede to the French Republic six months after the full and entire execution of the conditions and stipulations herein relative to the Duke of Parma, the Colony of or Province of Louisiana, with the same extent that it now has in the hands of Spain; and that it had when France possessed it and such as it should be after the treaties entered into between Spain and other States; * * * * The First Consul of the French Republic desiring to give to the United States a strong proof of his friendship, doth hereby cede to the United States, in the name of the French Republic, forever and in full sovereignty, the said territory, with all its rights and appurtenances, as fully and in the same manner, as they have been acquired by the French Republic, in virtue of the above-mentioned treaty concluded with his Catholic Majesty."

The reference to the Duke of Parma was in consequence of the agreement of France to cede certain territory that would enable that individual to elevate his rank to that of a petty king.

The price paid for Louisiana is usually, but erroneously, stated to have been twelve millions of dollars. It was eighty millions of francs, then the equivalent of fifteen millions of American dollars. Of this sum sixty millions of francs, or eleven million, two hundred and fifty thousand dollars, were paid France in the form of United States six per cent bonds. The other twenty millions of francs, equal to three million, seven hundred and fifty thousand dollars, were to be paid to citizens of the United States, direct by the United States, on account of debts due them by France, but which included none of the American claims growing out of French spoliations in 1797-98.

Napoleon's first proposition was that the United States should give "one hundred millions [francs], pay their own claims, and take the whole country." Barbe-Marbois, the French Minister of Finance, who subsequently signed the treaty on behalf of France, next proposed that the payment should be eighty millions of francs, without any provision for the debts. They finally agreed on the amount stated with the provision that one fourth of it should be applied to the debts.

As early as the first of April, 1802, President Jefferson wrote to Mr. Livingston, at Paris, urging him to take steps at once for the acquisition of New Orleans, as it would give free access to the ocean by way of the Mississippi. Mr. Jefferson said:

> "There is on the globe one single spot, the possessor of which is our natural and habitual enemy. It is New Orleans, through which the produce of three-eighths of our territory must pass to market, and from its fertility it will ere long yield more than half of our whole produce, and contain more than half our inhabitants."

After the confirmation of the treaty on Novemvember 1, 1803, he said in a letter of that date, to Dupont De Nemours, a personal friend, and a distinguished statesman and scientist of France:

> "The treaty which has so happily sealed the friendship of our two countries has been received here with general acclamation. For myself and my country I thank you for the aid you have given it, and I congratulate you upon having lived to give those aids in a transaction replete with blessings to unborn millions of men."

It appears that President Jefferson conceded the point raised that the constitution did not warrant the acquisition of foreign territory, still less its incorporation into the Union. In a letter to Senator Breckenridge, of Kentucky, written August 12, 1803, Mr. Jefferson said:

> "But I suppose they [the two Houses of Congress] must then appeal to the nation for an additional article to the Constitution, approving and confirming an act which the nation had not previously authorized. The Constitution has made no provision for our holding foreign territory, still less for incorporating foreign nations into our Union. The executive, in seizing the fugitive occurrence which so much advances the good of their country, have done an act beyond the Constitution. The Legislature, in casting behind them metaphysical subtleties, and risking themselves, like faithful servants, must ratify and pay for it and throw themselves on their country, for doing for them, unauthorized, what we know they would have done for themselves, had they been in a situation to do it."

After the treaty had been signed, Mr. Livingston said:

> "We have lived long, but this is the noblest work of our whole lives. The treaty which we have just signed has not been obtained by art or dictated by force; equally advantageous to the two contracting parties, it will change vast solitudes into flourishing districts. From this day the United States take their place among the powers of the first rank * * * The instruments which we have just signed will cause no tears to be shed; they prepare ages of happiness for innumerable generations of human creatures. The Mississippi and the Missouri will see them succeed one another, and multiply, truly worthy of the regard and care of Providence, in the bosom of equality, under just laws, freed from the errors of superstition and the scourges of bad government."

Thomas Jefferson at the age of 60.

Napoleon is represented to have said, when he was informed that the treaty had been concluded:

> "This accession of territory strengthens forever the power of the United States; and I have just given to England a maritime rival that will sooner or later humble her pride."

Upon signing the ratification of the treaty, the

First Consul is said to have theatrically flung down the pen with the exclamation:

> "I have signed away an empire!"

Another remark, attributed to Napoleon by Barbe-Marbois, was as follows:

> "Perhaps it will also be objected to me that the Americans may be found too powerful for Europe in two or three centuries; but my foresight does not embrace such remote fears."

The home opposition to the purchase came chiefly from the northern or New England States, which generally opposed the incorporation of Louisiana into the United States. Their representatives declared that the accession of so large a territory in the south and west would be to the advantage of the south politically and commercially, at the expense of New England.

In a speech opposing the treaty, Representative Griswold, of Connecticut, said on October 25, 1803:

> "It is, in my opinion, scarcely possible for any gentleman on this floor to advance the assertion that the President and State may add to the numbers of the Union by a treaty whenever they please, or, in the words of the treaty, may incorporate in the Union of the United States a foreign nation who, from interest or ambition, may wish to become a member of our government. Such a power would be directly repugnant to the original compact between the States, and a violation of the principles on which that compact was formed."
>
> "It is not consistent with the spirit of republican government that its territory should be exceedingly large; for, as you extend your limits you increase the difficulties arising from a want of that similarity of customs, habits and manners so essential for its support."
>
> "The vast, unmanageable extent which the accession of Louisiana will give to the United States, the consequent dispersion of our population, and the distribution of the balance which it is so important to maintain between the Eastern and Western States, threatens at no very distant day, the subversion of our Union."

Senator Plumer, of New Hampshire, vehemently declared, with a threat of secession—the first in the nation's history:

> "Admit this Western world into the Union, and you destroy at once the weight and importance of the Eastern States, and compel them to establish a separate independent empire."

Senator Tracy, of Connecticut, thus expressed his protesting opinions:

> "We can hold territory; but to admit the inhabitants into the Union, to make citizens of them, and States, by treaty, we can not constitutionally do; and no subsequent act of legislation, or even ordinary amendment to our Constitution can legalize such measures. If done at all, they must be done by universal consent of all the States or partners to our political association."

Senator Pickering, of Massachusetts, in a speech on November 3, 1803, after ratification of the treaty, said:

> "It is declared in the third article of the treaty that "the inhabitants of the ceded territory shall be incorporated in the Union of the United States." But neither the President and Senate, nor the President and Congress, are competent to such an act of incorporation. I believe the assent of each individual State to be necessary for the admission of a foreign country as an associate in the Union."

Representative Griffin, of Virginia, feared the effect of the vast extent of our empire; he feared the effects of the increased value of labor, the decrease in the value of lands, and the influence of climate upon our citizens who should migrate thither. He did fear (though this land was represented as flowing with milk and honey) that this Eden of the New World would prove a cemetery for the bodies of our citizens.

Senator James White, of Delaware, viewed the transaction with the gloomiest forebodings. He said:

> "But as to Louisiana—this new, immense, unbounded world—if it should ever be incorporated into the Union, of which I have no idea, and which can only be done by amending the Constitution, I believe it will be the greatest curse that could at present befall us. It may be productive of innumerable evils, and especially of one that I fear to ever look upon. * * * Thus our citizens will be removed to the immense distance of two or three thousand miles from the capitol of the Union, where they will scarcely ever feel the rays of the general government—their affections will become alienated; they will gradually begin to view us as strangers—they will form other commercial connections, and our interests will become distinct. * * * And I do say that under existing circumstances, even supposing that this extent of territory was a desirable acquisition, fifteen millions of dollars was a most enormous sum to give."

In defense of the treaty Representative Randolph, of Virginia, speaking in the House, said:

> "The treaty which we are now called upon to sanction has been hailed by the acclamation of the nation. It is not difficult to foresee, from the opinions manifested in every quarter, that it will receive the cordial approbation of a triumphant majority of this House. If such be the general opinion—if we are not barely satisfied with the terms of the treaty, but lost in astonishment at the all-important benefits which we have so cheaply acquired, to what purpose do we ask information respecting the detail of the negotiations? Has any one ventured to hint disapprobation of the conduct of the ministers which have effected the negotiation? I should rather suppose the eagerness of gentlemen would be ready to outstrip the forms of law in making themselves masters of their country, than that, now, when it is offered for our grasps, they should display an unwillingness, or at least an indifference, for that which so lately was all-important to them."

President Jefferson had convened Congress on October 17, and on October 31, 1803, the day before the treaty's ratification, a bill was enacted authorizing the President to take possession of Louisiana according to the conditions of the treaty and after its ratification. On November 1, 1803, the treaty was duly ratified.

But the anxieties and troubles were not yet at an end, nor the purchase secure. Up to this time Louisiana still remained in the possession and under the government of Spain. There had been no formal transfer to France under the treaty of St. Ildefonso, of October 1, 1800, though three years had elapsed, and France was not in the possession necessary to compliance with her American treaty, without causing some friction with Spain. Spain protested against the treaty, and the Spanish minister at Washington served notice on our government—

> "That he had orders to warn the Federal Government to suspend the ratification and execution of the treaties of cession of Louisiana, as the French Government in securing the Province had contracted an engagement with Spain not to retrocede it to any other power. * * * France not having executed that engagement, the treaty cession was void.

England was thought to be behind this Spanish movement, and the French Government had given orders that both transfers of authority should take place at New Orleans at the same time—that is, of Spain to France, and of France to the United States—so as to hasten the surrender to the United States before England could interfere.

In a letter written to Mr. Livingston by President Jefferson in December, 1803, with relation to Spain's contentions, he said that "France and Spain must settle their own difficulties in their own way themselves," and that he had, four days before, given orders to General Wilkinson, and the Governor of Mississippi Territory, to move down the troops at hand to New Orleans, and to receive possession from Laussat, then Colonial Prefect of New Orleans, and that "if he is not disposed to give possession, we shall take possession."

Regardless of Spanish protests, the French representative at Washington transmitted to the representative of his government at New Orleans instructions for the transfer, which reached there November 23, 1803. After a conference between the French and Spanish officials at New Orleans it was decided to make the change without delay, which was done.

The Spanish Commissioners, the Marquis De Caso Calvo, and Manuel De Salcado, formally notified Governor Don Carlos Dehault Delassus that on November 30, 1803, they "delivered to Pedro Clemente Laussat, Commissioner of the French Republic, the Province of Louisiana." On Tuesday, December 20, 1803, Laussat delivered, at New Orleans, the Province of Louisiana to General James Wilkinson, of the United States army, and Governor William Charles Cole Claiborne, then Governor of Mississippi Territory, who were the Commissioners of the United States.

France's second period of actual authority over Louisiana thus lasted for the brief period of twenty days. There were appropriate official formalities, military parades, and some speech-making in these ceremonies. The Spanish troops were all drawn up, and the people assembled with them. The French Commissioner presented to the Spanish Commissioners the order of the King of Spain, dated more than one year previous, for the delivery of the country to France, and with it also presented the direction of Napoleon to receive possession in the name of France. The Spanish Governor then surrendered the keys of the city, the Spanish colors were lowered, the flag of France went up in their place, and the cannon boomed. The existence of the Spanish King's old order and the later conduct of Spain was never very satisfactorily reconciled.

The formalities attending the French transfer to the United States were much the same as the foregoing. Flag lowering and raising, official demonstrations, American troops marching in, and the assembled populace. The French Prefect made a speech in which he said:

> "In conformity with the treaty, I put the United States in possession of Louisiana and its dependencies. The citizens and inhabitants who wish to remain here and obey the laws are from this moment exonerated from the oath of fidelity to the French Republic."

Governor Claiborne made a characteristic American speech, filled with patriotic fervor, in the course of which he said:

> "This cession secures to you and your descendants the inheritance of liberty, perpetual laws, and magistrates whom you will elect yourselves."

Claiborne became the first American Governor of the Territory of Louisiana, and later the first Governor of the State of Louisiana. In 1805, General Wilkinson became Governor of Louisiana Territory or District, and while in that position disclosed to President Jefferson the plot of Aaron Burr to invade Texas with an armed force, take possession of that and adjacent country, and establish a new republic in the southwest. Burr's arrest, trial on the charge of treason, his acquittal, and his whole career form a conspicuous chapter in our National history. Wilkinson was undoubtedly involved in the plot, and he soon disappeared from public view.

Circumstances of the times delayed full possession of Louisiana being assumed by the United States until the following spring, when, in March, St. Louis and upper Louisiana formally passed under the control and government of the United States. The official document of this transfer is dated "St. Louis de Illinois, 9th March, 1804," and is signed by Governor Don Carlos Dehault Delassus, and General (then Captain) Amos Stoddard of the United States army, who also acted as commissioner for the French Republic. The witnesses were Meriwether Lewis, of Lewis and Clarke exploring fame; Antonio Soulard, and Ch. Gratiot.

The originals of all these old transfer documents on the French side are now in St. Louis. In one of his letters to the editor of this History of Denver, Mr. William J. Seever, Secretary of the Missouri Historical Society, said:

"The documents are the originals and, as was the custom in olden times, are entirely written by the signers. Fortunately the greater portion of Governor Delassus' papers, both official and private, were never returned to Spain or France, and are now in St. Louis, and in possession of this Society and one of its members."

The tracts of the Missouri Historical Society, and information received directly from its Secretary, have been of the utmost usefulness to us with relation to the complicated history of Louisiana, and in connection with that of other old events we have undertaken to record.

The early American annals of the new domain were illumined by the remarkable victory of General Andrew Jackson, on January 8, 1815, near New Orleans. With six thousand Tennessee and Mississippi volunteers, he crushed the British army of twelve thousand veterans under General Sir Edward Pakenham. General Pakenham was killed and his army had a loss of two thousand five hundred killed and wounded. General Jackson had eight killed and thirteen wounded—a result to be classed with the victory of Admiral Dewey at Manila Bay, and that of Admiral Schley at Santiago. The peace treaty of Ghent had been signed December 24, 1814—more than two weeks before the battle; but news traveled slowly in those days.

When, as we have heretofore narrated in detail, Congress created the Territory of Orleans, partly from real estate of doubtful ownership, it also constituted the remainder of the great Louisiana region, the Louisiana Territory. In 1805, this name was changed to Louisiana District. On June 4, 1812, after the State of Louisiana was admitted, the old Territory was organized as the Missouri Territory. In its subsequent disintegration, every name, except that of Orleans, given any part of it by law in the various changes caused by creating new commonwealths, has been retained by some one of the existing States that were organized from its territory. But the popular name for the great domain long continued to be the "Louisiana Purchase."

From this splendid empire twelve States and one Territory have been created in whole or part, in order as follows:

Louisiana, (nearly all), 1812; Missouri, 1820; Arkansas, 1836; Iowa, first in 1845, and with enlarged limits in 1846; Minnesota, (nearly all), 1858; Kansas, (except a small section in the southwest corner), 1861; Nebraska, 1867; Colorado, (about two-fifths), 1876; South Dakota, 1889; North Dakota, 1889; Montana, (nearly all), 1889; the Indian Territory, (as at present organized, including Oklahoma, but excepting the narrow strip extending westward from the northwest corner of the main area), 1889; and Wyoming, (about three-fifths), 1890.

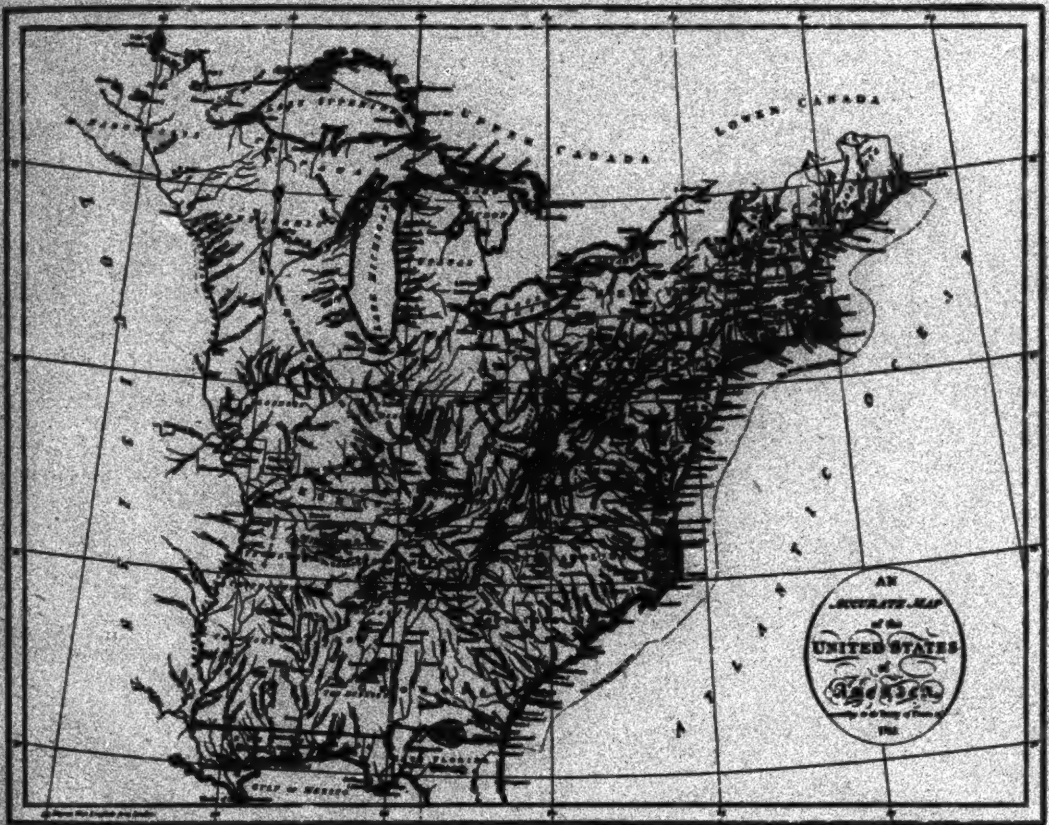
One of the questions—the great question then—which sprang out to the front soon after the purchase, was that of slavery. Should the new territory be slave or free? Slavery existed around the mouth of the Mississippi when the purchase was made. The State of Louisiana came into the Union with slavery in the first year of our second war with England, for reasons more military than civil, and little was said of its attendant human servitude. The next proposition to create a State in the new domain was that of Missouri, which applied for admission in 1818 with a constitution sanctioning slavery. Immediately the country was torn by dissensions and the disruption of the Union threatened. Two years of strife ensued when Congress adopted what was known as the "Missouri Compromise," and Missouri went in as a slave State. The "Compromise" prohibited slavery in any of the Louisiana territory north of the latitude thirty-six degrees and thirty minutes, excepting in the State of Missouri, that latitude being the State's southern boundary line. Under this arrangement Arkansas, the next new State created from the Territory, was admitted, but with many mutterings of discontent throughout the north. Texas, an independent organization, was annexed in 1845—the last slave State admitted, but none of its territory was clearly established to have been permanently included in the Province of Louisiana. Iowa followed, free, because its people wanted it that way. Then, shortly, came the act that precipitated some tremendous events. Congress in May, 1854, enacted a law creating the Territories of Kansas and Nebraska, and suspending—practically repealing—the "Missouri Compromise" provision so far as it applied to those Territories. This, it may be stated by the way, left no legal restrictions in the way of men bringing slaves to Denver in the pioneer days, if any had chosen to do so. In thus suspending the "Compromise," Congress declared its purpose to neither establish nor prohibit slavery, but to leave the question to the decision of the people of those Territories when they applied for admission as States. This soon set the country aflame. Minnesota next became a State, free by the unanimous choice of her people. Kansas, after sore turmoil and many struggles, was admitted as a free State; but the great civil war ensued, and after the four years of strife and blood and sorrow, the cause of all that untold misery to white and black humanity, was torn out by the roots and destroyed forever.

The boundary lines of the great Province were never clearly laid down as such things are done in our own times. Up to the year in which it passed to the United States, no survey of it had ever been attempted, nor was much in that direction accomplished for a long time after. In all the geographies, and on the maps made by the United States government, the Province was shown to extend west of the Rocky Mountains between the forty-second degree of north latitude and the British boundary line, to the Pacific ocean. This view of its limits had been accepted as correct until within a few years last past.

At this time it is not, of course, of any material importance whether "Louisiana" extended to the Pacific ocean, or not. The United States now extends there and far beyond, and the old Province long since disappeared from view. At the beginning of the Nineteenth Century knowledge of this western country was thin, scattered and confused, and it took a long time to clear away the vagaries growing out of ignorance. Before that time, the beliefs bordered on the absurd—or, they seem so now.

In the early days the people who were settling on the Atlantic coast had what we can not help considering rather comical notions of the extent of this continent, and of the area now embraced within the United States. China was supposed to lie not far out in the west, and many preparations were made to get there. The commission of Virginia's Captain John Smith, of Pocahontas fame, authorized him to sail up the Chickahominy river to find a passage to China.

The French when they began to colonize Canada entertained the same views. When they got well into the St. Lawrence they felt confident that by following that magnificent river they would soon reach the Flowery Kingdom. A reminiscence of this belief lingers in the name they gave the rapids near Montreal. When the explorers reached that obstruction to navigation they firmly believed they were fairly on their way to China; so they named it "La Chine Rapids"—or "the China Rapids," since expressed as "Lachine."



An English Official Map of the United States according to the Peace Treaty in 1783; published in London in 1794.

Marquette and Joliet were first led to believe that the Mississippi flowed into the "Sea of California." They had derived some information of it from the Indians in whose stories there appears to have been a little confused knowledge of the Colorado river. When La Salle began his career as an explorer in 1669, he supposed the Ohio river went into the "South Sea," and his first enterprise was for the purpose of learning where it did go.

France's original title to "Louisiana" was founded on La Salle's exploration of the Mississippi, his discovery of its mouth, and his extravagant declaration that for the King of France he took possession of the great river "and all the rivers which enter it, and of all the country they watered." This was followed by French occupation and settlement. La Salle knew nothing about the Oregon country; nor that the region watered by the tributaries of the Mississippi terminated in the northwest on the summit of the Rocky Mountain range, which divides the rainfall into the waters that find their way to the Pacific and those which flow eastward to the Mississippi.

When France made the cession to Spain in 1762, northwestern boundaries were not mentioned, because neither party had the faintest idea where they were. France merely ceded the territory, whatever and wherever it might be, and no hint of it extending to or toward the Pacific was given. She merely transferred such rights as she had acquired and held under La Salle's discovery and declaration.

In 1800 when France received the territory back from Spain, it was, in the language of the treaty, "with the same extent that it now has in the hands of Spain, and that it had when France possessed it, and such as it should be after the treaties subsequently entered into between Spain and other States." This last reference has already been explained as probably relating to adjustment of the "West Florida" boundary with the United States, in 1795.

France, now again in possession of the region, nominally, at least, with the rights and limitations in the northwest that had attached to it from La Salle's time, without any attempt or pretense of change in them ever having been made, ceded the territory to the United States, simply as the "Province of Louisiana," specifying no definite boundary lines, and conveying only such title and rights as she originally possessed.

Barbe-Marbois, related that he directed Napoleon's attention to the great obscurity of the boundaries of the Province and mentioned the difficulties it occasioned. Napoleon, he said, replied: "If the obscurity were not there, it would perhaps be good policy to put it there;" an opinion characteristic of the great Corsican's methods.

Barbe-Marbois, in his "History of Louisiana," said "the shores of the Western Ocean were certainly not comprised in the cession, but the United States have already established themselves there."

More than to any other man, credit for correcting this long-standing geographical error, is due Colonel James O. Broadhead, of St. Louis. A few years ago he became interested in it, and determined to remove it, if that were possible. After much labor, and a most painstaking investigation which thoroughly digested the old treaties, documents and records, he embodied his conclusions in an exhaustive paper which, in 1897, was published and widely disseminated by the Missouri Historical Society. In his introductory statements, Colonel Broadhead said:

> "When at Washington a few weeks ago, I saw hanging upon the walls of a room in the Interior Department, a new map of the United States, just published, upon which was printed in large letters, with marked boundaries, the different sections of our national territory and the sources from which the title to each was derived. The territory acquired from France by the Treaty of 1803, upon that map, was made to extend to the Pacific ocean, and to include the States of Oregon and Washington."
>
> "It is with some diffidence that I shall undertake to show that the territory acquired from France never did, expressly or by intendment, extend to the Pacific ocean, or in a western direction beyond the country watered by the Mississippi and Missouri rivers and their tributaries."

One result of Colonel Broadhead's services and researches is that the Interior Department has corrected its maps, and our government in its official publications and references no longer transmits an incorrect version of an important historical fact. It is singular that this one was misunderstood, erroneously represented and taught in the schools, and officially promulgated in a form radically wrong, for so many years. Unless Napoleon's suggestion to Barbe-Marbois about the obscurity of boundaries, had something to do with it in the beginning, the only available explanation seems to lie in the prevailing ignorance, even in the first quarter of this century, of what was then a far-away, practically unknown country.

Mr. Jefferson's foremost purpose was to get full possession of the Mississippi, and everything else attached to it was of secondary consequence. Therefore the distant boundaries in the far northwest, supposed to be in inaccessible localities in a worthless region, were regarded as of little importance wherever they might be. The later complications with Great Britain over the international boundary, and some of the claims advanced to sustain the American position at the beginning of that controversy, added to the confusion. Error, notorious for her persistence, established her false theories, and they flourished for nearly a hundred years.

England, prone to claim everything in sight, had demanded the Oregon country. Sir Francis Drake had voyaged along the California coast in 1579, and other English navigators followed him, but none of them established settlements. The early maps of North America set down "New Albion" as occupying a large territory bordering on the shores of the western ocean.

The claims of the United States to the Oregon region have been based on three propositions, discovery, purchase and occupation. The purchase was held to have been included in the acquisition of the Province of Louisiana, a conclusion altogether erroneous, for that Province never included any land over which water flowed to the Pacific. Spain nor France never had any valid claims to the territory west of the continental dividing range, between latitude forty-two degrees and the line of the British possessions. It is true that Spanish explorers went much farther north along the Pacific coast, but there were never any permanent Spanish occupation or settlements worth considering, north of forty-two degrees, and Spanish "occupation" of the region was far more a shadowy theory than an actual fact. Beginning in 1543, Cabrillo, a Portuguese in Spanish service, and his successors, Ferrell, Aguilar, Perez and others extended their voyages as far north as fifty-four degrees, forty minutes, but they made no stay nor did they attempt to penetrate the interior. De Fuca, a Greek navigator, was also up there, in 1592. The real basis of the title of the United States to the Oregon country was in its discovery, occupation and settlement.

Map showing Territorial Growth of United States on Continent of North America.

The first American knowledge of the Columbia river was through Captain Robert Gray, of Boston, who entered the mouth of the unknown, beautiful stream in his ship, the "Columbia Rediviva," in 1792. He named it after his vessel whose keel was the first which had ever cut its waters.

In November, 1805, the mouth of the river was reached by the United States overland exploring expedition under Captains Lewis and Clarke, of the United States army. This expedition was organized at St. Louis in 1804, to explore the new Louisiana purchase and the Columbia river country. It entered the mouth of the Missouri May 14 of that year, proceeding up that stream by boats to its headwaters; thence across the dividing ranges on foot to the headwaters of the Columbia, where they built other boats and proceeded to the river's mouth. The party returned by the same general routes, reaching St. Louis September 23, 1806, after an absence of two years, four months and ten days. This was a great, adventurous and notable undertaking for its time.

In 1810, the first American settlements were made, and in 1811 John Jacob Astor established the fur-trading post, Astoria, on the left bank of the river near its mouth. He dispatched two expeditions from the east in 1810, one by land and the other by sea. The overland party reached the destination first and began the settlement.

After the cession of the Province of Louisiana to the United States by France, Spain made some pretenses of having rights in the Oregon country, founding them, not on any extension there of the Province of Louisiana, but on what her explorers had done one hundred and fifty years before, and her alleged later occupation of the region. She did not press them very seriously, but kept grumbling and complaining about them. So, to clear away all doubts, to make assurance doubly sure, and to remove all possibility of future contention on the part of Spain, the treaty of 1819, by which she ceded the Floridas to the United States, contained a clause thus defining the boundaries between the United States and the remaining Spanish possessions (Mexico), in North America:

> "Beginning at the mouth of the Sabine river, north along the west bank of that river to the 32nd degree of latitude, where it strikes the Rio Roxo of Nachitoches or Red River; thence following the course of the Rio Roxo westward to the degree of longitude 100 west from London, and 23 from Washington; then crossing the said Red river and running thence by a line due north to the river Arkansas, thence to its source in latitude 42 north, and thence by that parallel of latitude to the South Sea. But, if the source of the Arkansas shall be found to fall north or south of latitude 42, then the line shall run from the said source due south or north, as the case may be, till it meets the said parallel of 42, and thence along said parallel to the South Sea."

That parallel was then established as the northern boundary of California, and so remains; later, it became the northern boundary of Nevada and Utah.

There was a curious sequence to the Spanish interest in Oregon, and a most inconsistent one on the part of a great many American people. After the treaty of 1819 with Spain, came the matter of settling boundary lines out there with Great Britain. Many Americans turned on the record, and insisted that the region's northern limit was latitude fifty-four degrees, forty minutes, basing the claim on the ancient voyages of the Spanish explorers, and the alleged later Spanish occupation, which were held to have established rights transferred to the United States by Spain's treaty of 1819—rights denied to Spain while that treaty was under consideration. Spain had tentatively urged that as navigators in her service had, in the sixteenth century, explored that coast as far north as fifty-four degrees, forty minutes, she had claims on the region, which she held had been strengthened by alleged settlements some of her people had made in more recent years, and which she assumed they still maintained. But the United States waived these pretensions aside.

England persisted in her claims to the Oregon country, certainly as far down as the mouth of the Columbia river; and was prepared to claim still more if prospects for getting it seemed good. The matter now became a great political question, and a party slogan, "Fifty-four, forty, or fight," menacing England, made memorable the Polk presidential campaign of 1844. Since 1818 the general region between latitude forty-two degrees and that of fifty-four degrees, forty minutes, had been by mutual consent, jointly occupied by the United States and Great Britain, pending the adjustment of the boundary, which was done by treaty in 1846, making latitude forty-nine degrees the boundary line, and dispensing with any fighting over it.

The territory of Oregon originally included all United States territory between the Rocky Mountains and the Pacific coast north of latitude forty-two degrees. When the movement to give it a territorial government was inaugurated, much opposition arose in Congress. The region was so wild, so remote, and so little understood, that the proposition seemed preposterous to many. Daniel Webster who, as we shall further see, had little knowledge of the great west, and still less faith in it, declared in one of his ponderous speeches, that Oregon was "so far off that a delegate to Congress could not reach Washington City until a year after the expiration of his term."

But Oregon got a Territorial government, and from its domain the State of Oregon was formed in 1859; Washington in 1889; Idaho in 1890; leaving smaller portions to become western sections of Montana and Wyoming.

In a speech in the Senate on January 25, 1843, Senator George McDuffie, of South Carolina, said with reference to the western country when a railway to the Pacific was under discussion:

> "As I understand it, there are seven hundred miles this side of the Rocky Mountains that are uninhabitable, where rain never falls, where there are mountains wholly impassable except through gaps. How are you going to supply steam? Have you made an estimate of the cost of a railway to the Columbia? The wealth of the Indies would be insufficient! What use would it be for agriculture? I would not give a pinch of snuff for the whole territory. I wish the Rocky Mountains were an impassable barrier. If there was an embankment of five feet to be removed I would not consent to expend five dollars to remove it and enable our population to go there. I thank God for his mercy in placing the Rocky Mountains at that place."

On the western boundary subject Senator Benton, of Missouri, said as early as 1825:

> "The ridge of the Rocky Mountains may be named as a convenient, natural and everlasting boundary. Along the ridge the western limits of the Republic should be drawn and the statue of the fabled god Terminus should be erected on its highest peak, never to be thrown down."

No part of the region now forming the State of Texas was included in the Province of Louisiana. In 1821, when Mexico threw off the Spanish yoke, all of Texas was Mexican territory. Texas declared its independence of Mexico in 1836, maintaining its position by arms, and remaining an independent government until 1845, when it became, by annexation, and against the vehement protests of Mexico which still claimed it, one of the United States. This brought on the Mexican war with its well-known consequences.

Chief among these was the accession by the United States under the treaty of Guadaloupe Hidalgo, in 1848, which formally ended the war, of the large area out of which the State of California was formed, with its existing outlines, in 1850; Nevada in 1864; and Utah in 1896. In addition to these it supplied territory for the southwest part of Wyoming, nearly one-half (the western part) of Colorado, and the larger portion of the Territories of New Mexico and Arizona.

The original area claimed by Texas was far larger than the present area of that State. It included more than half of New Mexico, a considerable corner in southwestern Kansas, and all of Colorado lying due southward from the Arkansas river. At the headwaters of the Arkansas, the claim took the form of a somewhat narrow strip extending due north some distance into what is now Wyoming. Mexico never recognized the Texan claim, but Texas persisted in asserting it even after the war with Mexico. But in 1850, for a consideration, she relinquished it to the general government and the settlement left her with her present boundaries.

By an act of Congress at this time (1850) the Territory of New Mexico was created. It embraced the region west of Texas, extending to California, and included a considerable section of what is now southern Colorado. In 1854, the area of New Mexico was materially enlarged by the United States purchasing from Mexico a strip along the southern part of the Territory, between the Rio Grande and Colorado rivers and south of the Gila river, commonly known as the "Gadsden Purchase." In 1863, Congress divided New Mexico, and made the western part the Territory of Arizona. In 1866, an angular section in the northwest corner was detached from Arizona and annexed to Nevada, leaving those divisions as now constituted.

The area of "Louisiana" as we have defined it here and as shown by the accompanying map, was eight hundred and eighty-three thousand and seventy-two square miles, containing five hundred and sixty-five million, one hundred and sixty-six thousand and eighty acres. This excludes any territory west of the "divide" of the Rocky Mountains and the disputed district east of the lower Mississippi.

This area is more than seven times that of Great Britain and Ireland; more than four times that of the German Empire, or of the Austrian Empire, or of France; more than three times that of Spain and Portugal; more than seven times the size of Italy, and twice that of Egypt; nearly ten times that of Turkey and Greece; nearly three times that of Norway and Sweden, and nearly six times that of the Japanese Empire. It is also larger than Great Britain, Germany, France, Spain, Portugal and Italy combined. It is about one-fourth less than the area of the thirteen original States and the old Northwest Territory. The property values existing in it would probably aggregate, on actual valuations, twenty billions of dollars.

In no part of this magnificent empire have more wonderful developments of its unsurpassed natural resources been made, from no part have come greater or more important additions to the wealth of the Nation, than Colorado presents. In July, 1898, Honorable Binger Hermann, Commissioner of the General Land Office at Washington, made a special and carefully prepared report to the Secretary of the Interior, entitled "The Louisiana Purchase and our Title West of the Rocky Mountains." This was primarily for the purpose of demonstrating the necessity for correcting the official maps with respect to the boundaries of the "Louisiana Purchase," and was incidentally made the means of presenting much other valuable information. In connection with his observations upon the development of the domain, Mr. Hermann singled out Colorado as the most conspicuous of all the "Purchase" States in results that have been accomplished. He said:

"I illustrate not with such older States as Louisiana, Iowa, Kansas, Arkansas, Missouri, or even Minnesota with her 60,000,000 bushels of wheat, ranking her as first among the producers of our nation's wheat yield of 530,000,000 bushels in 1897, not to mention her many other resources, but prefer rather to select the more remote and most recently developed portions of the Louisiana Purchase nearer the Rocky Mountain region, as here the record will read enough like a fairy tale to interest and delight, as well as amaze any well wisher of his country. The report of the State Commissioner of Mines of Colorado furnishes the following as the production and value of four metals mined in that State, for the year named."

Mr. Hermann then annexed a statement of the gold, silver, copper and lead production and values, for 1897, to which he added the value of sheep, of cattle, and of the coal yield, making a total under only these seven classifications, of nearly seventy-one millions of dollars. Inasmuch as something of these matters, and of later date, will appear elsewhere in this volume, we have not reproduced Mr. Hermann's statement in detail.

No act of the Executive of any Nation at any period in the history of the world, was followed by results so stupendous as those which have grown out of Mr. Jefferson's purchase of the Province of Louisiana. It was, to repeat his own prophetic observation, one "replete with blessings to unborn millions of men."

CHAPTER XIII.

Pioneer Americans in the Pike's Peak Country—Lieutenant Pike's Exploring Expedition—His Attempt to Ascend the "Grand Peak"—Trying Experiences in Crossing the Mountains—Capture of the Party by Spaniards—Detention at Santa Fe—Subsequent Release and Return to the East—Pike's Impressions of the Western Country—His Soldier's Death.

Previous to the dawn of the Nineteenth Century, the history of the human race in all this Denver region, was like the dim darkened landscape which the traveler sees at night, or fails to see, from the window of a swift-moving railway car. The few glimpses he catches, as he whirls along at a speed at which he can only guess, give him but little knowledge of the country through which he is passing. He cannot tell from anything he sees how far he has gone or how fast he has moved. But when the day breaks all is different. He can then observe everything in its proper light and true perspective. He then knows and comprehends how rapidly he moves from point to point. The coming of daylight has made all distinct and clear.

With the appearance and domination of the Anglo-Saxon man here, as everywhere he goes, arise records, tracts, annals, manuscripts, documents, letters—all shedding their light upon the new scenes that have burst into view; upon the events that so swiftly follow each other. The contrast between what was obscure, unknown, unexplored, at the beginning of the just ended century, and what was well-defined, positive in outlines, startling in change and advancement, and wonderful to behold in its closing year, is even greater than the contrast between the dim landscape, with its mere fantastic hints of itself, that greets the eye of the railway traveler, his face pressed against the pane, trying to catch a glimpse of what may be there in the night's deep gloom, and the same scenes rushing by in the full glare of mid-day.

But here and there in the historical landscapes of long past years, we have had the shadows partly dispelled and have passed places where some light fell upon the scenes. We have seen the misty columns of Spanish explorers—the adventurous, romantic, gold-loving Spaniards, God-fearing in their way—moving over the plains and winding through the mountains, eager for wealth and zealous for the faith. We have seen, in later glimpses, the heralds of the industrious, enthusiastic French, pushing their way up the rivers flowing from the west, and threatening the ancient, uninspiring Spanish authority then prevailing in our southwestern region.

A former common, though mistaken, impression was one which assumed that, aside from the early visits of the Spaniards, the organized exploring expeditions of the United States government brought the first companies of white men into this Colorado country. Some writers in exploiting the "Pathfinder," and treating lightly the work of Pike and Long, have gone so far as to convey by negation an impression that Colorado was practically an unknown region previous to the Fremont exploring expeditions, and that up to that period there was no knowledge by white men, outside of Spanish circles, of the hidden treasures in its rocks and the beds of its streams. We have already seen how greatly mistaken were such impressions and beliefs, and we will find much more to further confirm their inaccuracy. The Colorado plains and mountains were familiar places to many American white men before "Pathfinder" Fremont came along, and several had traversed them before Pike "discovered" the peak that bears his name.

The distinction of having been the first American white man to reach the Rocky Mountains at the point where Denver stands, appears to swing between James Pursley and Baptiste La Lande. Pursley, a carpenter by trade, originally hailed from Bardstown, Kentucky, and some of the narratives assuming to account for his presence in this part of the country at so early a date, are conflicting. One has it that he was hunting and trapping in the Osage river country of Missouri in 1802; that in the next year (1803) he was hunting and trading along the River Platte in company with a party of Missouri Indians, and that the mixed assemblage was chased into the mountains of this locality by other Indians, and afterward went down to Santa Fe.

Another account is that Pursley on a trading venture made his way to these mountains in 1803 or 1804, without associates, by way of the Platte river, following the south branch past the site of Denver; that he was made a prisoner by Indians who captured him somewhere here on the South Platte, and proceeding across to the South Park, afterward took him down to Santa Fe, where he was released.

The first of these is partly correct, but the other has little or no historical value. Pursley is credited with having found gold while on his travels through here, the circumstances of which will be related hereafter.

Lieutenant Pike, the explorer, in that part of his report which he designates as "Geographical Observations on the Interior of New Spain," gives the following account of Pursley, whom he encountered at Santa Fe, and which is, no doubt, a strictly accurate one:

"In the historical anecdotes of New Mexico it may not be improper to record the name of James Pursley, the first American who ever penetrated the immense wilds of Louisiana, and shewed the Spaniards of New Mexico, that neither the savages who surround the deserts which divide them from the habitable world, nor the jealous tyranny of their rulers, was sufficient to prevent the enterprising spirit of the Americans from penetrating the arcanum of their rich establishments in the New World. Pursley was from near Baird's Town [Bardstown], Kentucky, which he had left in 1799. In 1802, with two companions, he left St. Louis and traveled west on the head of the Osage river, where they made a hunt; from thence they struck for the White river of the Arkansaw, and intended to descend it to Orleans but while making preparations the Kanzes stole their horses; having secured their peltries they pursued them into the village. The horses were there, but the Indians refused to give them up; Pursley saw his horse with an Indian on him going to the water at the edge of the town. He pursued him, and with his knife ripped open the horse's bowels. The Indian returned to the village, got his gun and came and snapped it at Pursley, who followed him into the village with his knife; the Indian took refuge in a lodge surrounded by women and children. This conduct struck the chiefs with astonishment and admiration of the 'mad Americans,' as they termed them, and they returned the other horses to the hunters. Pursley and his companions now returned to the place where they had buried their peltries and determined to pursue the route by land to St. Louis; but some persons stole their horses a second time, when they were no great distance from the Osage river, on which they formed a rough canoe and descended that stream, nearly to its junction with the Missouri. Here they overset their canoe and lost their whole year's hunt, but saved their arms and ammunition, which are always the primary objects in a desert. On the Missouri they met Monsieur ——— in his barge, bound to the Mandanes [on the upper Missouri]. Pursley embarked with him for the voyage; his two companions preferred to return to their homes. On the arrival of the former at the point of destination, his employer dispatched him on a hunting and trading tour, with some bands of the Paducas and Kyaways, with a small quantity of merchandise. In the ensuing spring they were driven by the Sioux from the plains into the mountains which give rise to the Plate, Arkansaw, etc., and it was their sign which we saw in such amazing abundance on the headwaters of the Plate, their party consisting of nearly two thousand souls with ten thousand beasts. The Indians knowing they were approximate to New Mexico, determined to send Pursley with his companions and two of their body into Santa Fe to know of the Spaniards if they would receive them amicably, and enter into a trade with them. This being acceded to by the Governor (Allencaster) the Indian deputies returned for their bands; but Pursley thought proper to remain with a civilized people, among whom a fortuitous event had thrown him, a circumstance which he assured me he had at one time entirely despaired of. He arrived at Santa Fe June, 1805, and had been following his trade (carpenter) ever since, at which he made a great deal of money, except when working for the officers, who paid him little or nothing. He was a man of strong natural sense, and of undaunted intrepidity; and entertained me with numerous interesting anecdotes of his adventures with the Indians, and of the jealousy of the Spanish government. He was once nearly being hanged for making a few pounds of powder, which he innocently did, as he was accustomed to do in Kentucky, but which is a capital crime in these provinces. He still retained his gun, which he had with him during his whole tour, and spoke confidently that if he had two hours' start, not all the province could take him. He was forbidden to write, but was assured he should have a passport whenever demanded; he was obliged, however, to give security that he would not leave the country without the permission of the government. I brought letters out for him."

We have copied Pike's account of Pursley at length, partly for the purpose of clearly setting forth the circumstances that brought Pursley here at that time, and partly to show the venturesome intrepidity of the man; but the statement about the number of Indians and horses that were with him in the South Park is surprising. The Mandan villages whence he started southward on the trading expedition were on the upper Missouri far toward its exit from the mountains. Pursley made a long journey and had a hard time between his departure from St. Louis and his arrival at Santa Fe.

Baptiste La Lande, an American of French extraction, was sent from Kaskaskia, Illinois, in 1804, by William Morrison, a merchant of that place, with a stock of goods for frontier trade in this then remote region. He had another white man as an assistant and companion, but who he was and what became of him, no account has been retained; he appears to have dropped completely out of sight in all subsequent parts of the story. La Lande was under instructions to go as far as Santa Fe in search of business. He came up the South Platte, and proceeding southward, finally reached Santa Fe, where he disposed of his goods at fabulous prices. There Baptiste succumbed to the charms and blandishments of certain brunette beauties, pocketed the whole proceeds of his employer's venture, and remained in the New Mexican country.

When merchant Morrison learned of the destination of Pike's western expedition he thought his derelict employee might be encountered and made to return the proceeds of the goods he had sold. Of this Pike says:

> "When I was about to sail, Morrison conceiving that it was possible that I might meet some Spanish factors on the Red river, intrusted me with the claim, in order if they were acquainted with La Lande, I might negotiate the affair with them."

But there is no record that Baptiste was ever called to account and made to disgorge. When Pike was in Santa Fe Governor Alencaster was advised of the case and in a few days, according to Pike's narrative, "informed me that he had made inquiry as to the abilities of La Lande to discharge the debt, and found that he possessed no property, but that at some future period he would secure the money for me." This, however, appears to have been the last of it.

According to Pursley's statement to Pike that he reached Santa Fe in June, 1805, that unfaithful steward, the susceptible Baptiste, would seem to have been a year ahead of the Bardstown carpenter in traversing the banks of the South Platte through this region.

In 1817, August Pierre Choteau and Jules Demun, citizens of St. Louis, with twenty other men in their party, made an expedition from St. Louis to the country around the headwaters of the South Platte, to trade with the Indians. Later they went down upon the foot-hill tributaries of the Arkansas. While in that locality they got over into Spanish territory, of which that stream was then held to be a boundary, where they were all arrested by a Spanish military force or guard, taken down to Santa Fe and kept in close confinement, some of them in chains, for forty-eight days. They had a troublesome time in recovering their property and getting out of that country.

Several years before Long's expedition other traders visited this region and a profitable trade existed, though no permanent establishments were attempted. A considerable commerce was carried on between merchants of St. Louis and the inhabitants of New Mexico which, at that time, included the larger part of what is now Colorado, the definite boundaries between the two countries not having been agreed on until 1819. The French pioneers in the fur business, as we have seen, had been operating as far west as the Missouri River borders of Kansas and Nebraska, nearly a hundred years before Pike explored this part of the country.

The first expedition sent out by the government to penetrate the then newly-acquired Louisiana Territory, was that of Lewis and Clarke to the mouth of the Columbia river and back, in 1804-05-06, of which some account has been given in the history of the Louisiana Province. It followed the Missouri river going and returning, and was at no time near this part of the country.

The next one was that of Lieutenant Zebulon Montgomery Pike, in 1806. He had been along the upper Mississippi the previous year on an enterprise that was partly for exploring and partly to make friendly advances to the Indians up there, and to apprise them of their changed allegiance by the transfer of "Louisiana" to the United States.

In the first decade of that century there was great and constant friction between the United States and Spain, and affairs began to wear a very serious aspect. In 1806 troops of the two governments almost came to actual hostilities on the frontiers of New Spain and our old Territory of Orleans, and war was expected to occur between the two nations. It was, indeed, regarded as inevitable. The southwest boundary of the Louisiana Purchase was one of the prominent causes of the trouble. It was in dispute and much jealousy was manifested on both sides. Each power claimed Red river, and with it Spain claimed a great deal more. She had previously asserted her dominion to the northeast of the Arkansas over the plains to an undetermined distance, and to the north of it here along the base of the mountains far beyond the site of Denver.

The United States expected to make the Red river part of the southwestern boundary, as it did become when the quarrel was settled by the treaty of 1819; and in May, 1806, had dispatched the "exploring expedition of Red river," a small force under the command of Captain Sparks, instructed to ascend the river "to the country of the Pawnee Indians." There he was to buy horses from the Pawnees, to be used in transporting his men and effects "to the top of the mountains," considered to be distant about three hundred miles. The party was met while on the Red river by one of the Spanish commands then guarding their frontier, which largely outnumbered the Americans, which fact and the probability of a collision, induced the latter to turn back.

Because of these strained relations and in consequence of the desire to avoid imperilling Pike's expedition, and to prevent Spanish protests against it, there was some diplomacy employed in organizing and dispatching it, and the publicly announced purpose of the enterprise was made to appear somewhat different from the alleged ultimate purpose had in view—that of learning something definite of the geography of the southwestern part of "Louisiana." However, the Spanish authorities were apprised of the objects of the undertaking before Pike left St. Louis. Of this he says in a foot-note in his "Account:"

"I was fitting out my expedition from St. Louis, when some of the Spanish emissaries in that country transmitted the information to Major Merior, and the Spanish consul at that place, who immediately forwarded the information to Captain Sebastian Roderiques, the then commandant at Nacogdoches, who forwarded it to Colonel Cordero, by whom it was transmitted to the seat of government. This information was personally communicated to me, as an instance of the rapid means they possessed of conveying intelligence relative to the occurrences transacting on our frontier."

At this time there was at St. Louis a considerable party of Osage Indians of both sexes and all ages, who had been taken prisoners by their hereditary enemies, the Pottawatomies from east of the Mississippi. They had been rescued from their captors by some United States troops, and to convoy them to their people in the Osage country, was one of the nominal purposes of Pike's expedition—"the primary object," as General Wilkinson puts it. They were the "passengers" mentioned in Wilkinson's order which appears herein a little further along. In addition to these captives, there were several Osage chieftains who had been to Washington on a visit to their new Great Father, and who were also to go to their tribes with Pike's company.

Zebulon M. Pike.
(From the steel engraving in his "Account," etc.)

After the conspiracy of Aaron Burr was exposed, many of the American people associated Pike's expedition with it and asserted that it was a part and parcel of it. To this day the reasons for that belief have not been wholly dispelled; that is to say, certain peculiar circumstances connected with it, which need not be considered here, have not been relieved from suspicion. The expedition was not undertaken by order of the President, nor of the Secretary of War, but by that of General James Wilkinson, the commander of the army. Wilkinson's relations with Burr, as later revealed, made his every act at that time a suspicious one in the minds of the people; and his order to Pike to proceed to the far southwest part of Louisiana Territory, in connection with collateral circumstances, appeared to make the enterprise a movement in the interest of the conspiracy.

Pike, upon his return vehemently denounced, as absolutely untrue, these calumnies upon himself; and it is certain, that no matter what assumed grounds there were for them, he was personally ignorant of their cause and innocent of any wrong intent. One of the accusations was that Pike's expedition was intended to precipitate a conflict with New Spain in Burr's interest, but the smallness of Pike's force makes such a purpose highly improbable. He was a deeply and sincerely patriotic man, and his integrity and fidelity were of the loftiest character. He did no more than obey the orders he received from his commander.

The following is General Wilkinson's order to Pike, in full, and the reader will observe that it enjoins upon the explorer a wide range of duties:

"To Lieutenant Z. M. Pike.

"St. Louis, June 24th, 1806."

"Sir,"

"YOU are to proceed without delay to the cantonment on the Missouri, where you are to embark the late Osage captives, and the deputation recently returned from Washington, with their presents and baggage, and are to transport the whole up the Missouri and Osage rivers to the town of the Grand Osage. The safe delivery of this charge at the point of destination constitutes the primary object of your expedition, and therefore you are to move with such caution as may prevent surprise from any hostile band, and are to repel with your utmost force any outrage which may be attempted. Having safely deposited your passengers and their property, you are to turn your attention to the accomplishment of a perfect peace between the Kansas and Osage nations, for which purpose you must effect a meeting between the head chiefs of those nations, and are to employ such arguments, deduced from their own obvious interests, as well as the inclinations, desires, and commands of the President of the United States, as may facilitate your purpose and accomplish the end. A third object of considerable magnitude will then claim your attention; it is to effect an interview, and establish a good understanding with the Ietons or Camanches. For this purpose you must interest White Hair of the Grand Osage, with whom and a suitable delegation, you will visit the Pawnee Republic, where you may find interpreters and inform yourself of the most feasible plan by which to bring the Camanches to a conference. Should you succeed in this attempt, and no pains must be spared to effect it, you will endeavor to make peace between that distant and powerful nation and the nations which inhabit the country between us and them, particularly the Osage; and finally you will endeavor to induce eight or ten of their distinguished chiefs to make a visit to the seat of government next September, and you may attach to this delegation four or five Pawnees, and the same number of Kansas chiefs. As your interview with the Camanches will probably lead you to the head branches of the Arkansaw and Red rivers, you may find yourself approximated to the settlements of New Mexico, and therefore it will be necessary you should move with great circumspection, to keep clear of any hunting or reconnoitering parties from that province, and to prevent alarm or offense, because the affairs of Spain and the United States appear to be on the point of amicable adjustment; and, moreover, it is the desire of the President to cultivate the friendship and harmonious intercourse of all the nations of the earth, and particularly our nearest neighbors, the Spaniards."

"In the course of your tour you are to remark particularly upon the geographical structure, the natural history, and population of the country through which you may pass, taking particular care to collect and preserve specimens of everything curious in the mineral and botanical worlds, which can be preserved and are portable. Let your courses be regulated by your compass, and your distances by your watch, to be noted in a field book; and I would advise you, when circumstances permit, to protract and lay down in a separate book the march of a day at every evening's halt."

"The instruments which I have furnished will enable you to ascertain the variations of the magnetic needle, and the latitude, with exactness; and at every remarkable point I wish you to employ your telescope in observing the eclipses of Jupiter's satellites, having previously regulated and adjusted your watch by your quadrant, taking care to note with great nicety the periods of immersion and emersion of the eclipsed satellite. These observations may enable us after your return, by application to the appropriate tables, which I cannot now furnish you, to ascertain the longitude. It is an object of much interest with the executive to ascertain the direction, extent, and navigation of the Arkansaw and Red rivers; as far, therefore, as may be compatible with these instructions, and practicable to the means you may command, I wish you to carry your views to those subjects, and should circumstances conspire to favor the enterprise, you may detach a party with a few Osages to descend the Arkansaw, under the orders of Lieutenant Wilkinson or Sergeant Ballinger, properly instructed and equipped to take the courses and distances, to remark on the soil, timber, etc., and to note the tributary streams. The party will, after reaching our post on the Arkansaw, descend to Fort Adams, and there wait further orders. And you yourself may descend the Red river, accompanied by a party of the most respectable Camanches, to the post of Natchitoches, and there receive further orders. To disburse your necessary expenses, and to aid your negotiations, you are herewith furnished six hundred dollars' worth of goods, for the appropriations of which you are to render a short account, vouched by documents to be attested by one of your party. Wishing you a safe and successful expedition,"

"I am, Sir, with much respect and esteem,
Your very obedient servant,"
(Signed) "JAMES WILKINSON."

Besides obtaining "such geographical knowledge of the southwestern boundary of Louisiana, as to enable the government to enter into a definite arrangement for a line of demarkation between that territory and North Mexico," Pike recorded in his diary that his further object was to "obtain information founded on scientific pursuits, and with a view of entering into a chain of philanthropic arrangements for ameliorating the condition of the Indians who inhabit those vast plains and deserts."

In an official report, made by Pike immediately after his return in 1807, he gives the names of all the members of his party when it started on the journey. In other official records of the expedition Pike figures as a Lieutenant, but in his roster he attaches the rank of Captain to his name. In his language his company "consisted of the following persons, to wit:"

Captain Z. M. Pike,
*Lieutenant James B. Wilkinson,
Doctor John H. Robinson,
Sergeants* Joseph Ballenger
and† William E. Meek;
Corporal† Jeremiah Jackson,
Privates
*John Boley,
Henry Kennerman.
*Samuel Bradley,
John Brown,
†Jacob Carter,
†Thomas Dougherty,
William Gordon,
*Solomon Huddleston,
Theodore Miller,
Hugh Menaugh,
†John Mountjoy,
Alexander Roy,
†John Sparks,
†Patrick Smith,
Freegift Stout,
*John Wilson,
Interpreter, Baroney Vasquez.

"*Those marked thus descended the Arkansas river, and arrived at New Orleans about the —— of February, 1807. †Those marked thus are still detained in New Spain. The remainder arrived at Nachitoches on or about the 1st of July 1807; but it may probably be better to leave the whole time undefined, to be regulated by the honorable secretary of war."

"Z. M. PIKE, Major."

Pike left St. Louis on July 11, 1806, and went to Belle Fontaine, a small cantonment or military post on the Missouri river near its mouth. From this point, in the afternoon of July 15, he and his command, accompanied by fifty-one Indians, started up the Missouri river in boats—the beginning of the long and memorable journey.

The assemblage proceeded up the Missouri to the Osage and thence by that stream to the point nearest the Osage town, where the company left the river and went by land west the short distance to the town, having been six weeks on this part of the journey. The captives were received by their people with many demonstrations of rejoicing over the chagrin the Pottawatomies must have felt for having been deprived of the pleasure of burning them at the stake.

Here at the "Grand Osage" Pike procured horses which he loaded with his equipment, provisions and presents, and started across the country. The incidents of his journey there and his dealings with the Indian tribes he encountered, are not essential to the purposes of this narrative, and will be passed over. He met with no resistance nor hostility from the Indians, nor with any adventures of great importance. He describes the plains he traversed as having been "black with buffalo."

Pike reached the Arkansas river at a point near the Pawnee fork on October 27, 1806. Here he detached from his small command Lieutenant Wilkinson and five privates to make a reconnoissance to the mouth of the Arkansas, which was successfully accomplished, as suggested in the foregoing extract from his report.

Pike now crossed the Arkansas with the remainder of his party and proceeded westward along the southern bank of the stream. He was on territory which the Spaniards vehemently claimed as their own. At this time, in consequence of advices from St. Louis, the Spanish authorities had a detachment of troops scouring the country down there in search of the party of Americans. Pike had not gone far along the river until he came upon one of their camping places, and he kept coming upon them in every day's march, the command apparently being but a few days ahead of him. But the Spaniards did not find him in that part of his journey, and we may dismiss them for the present. Pike went forward with much caution toward the great mountains of the west, still on the south side of the river, notwithstanding an agreement made that same year between the United States and Spain that pending a final definition of boundary lines down there, parties from either side should keep away from the debatable territory of the other.

In the afternoon of November 15th Pike noticed in the distant horizon what he first thought was a small cloud. In his "Account" he says of this:

"At two o'clock in the afternoon I thought I could distinguish a mountain to our right, which appeared like a small, blue cloud. Viewed it with the spy-glass, and was still more confirmed in my conjecture, yet only communicated it to Dr. Robinson, who was in front with me; but in half an hour, they appeared in full view in front of us. When our small party arrived on the hill, they with one accord gave three cheers for the Mexican mountains."

The party eagerly moved forward, but the mountains appeared to be as far away as ever. Under date of November 17th Pike thus records, an experience which has puzzled many a traveler since his time:

"Marched at our usual hour, pushed with an idea of arriving at the mountains; but found at night no visible difference in their appearance from what we did yesterday."

On November 23rd, Pike arrived at the mouth of a small tributary of the Arkansas—the St. Charles, or San Carlos—and went into camp, still on the south side of the larger stream. The next day he built a rude fortification or log breastwork which he says was "five feet high on three sides, and the other was thrown upon the river." This was undoubtedly the first structure reared by Americans in what is now Colorado. Pike had named the cloud-like eminence which first attracted his attention the "Grand Peak," though it now bears his own familiar name.

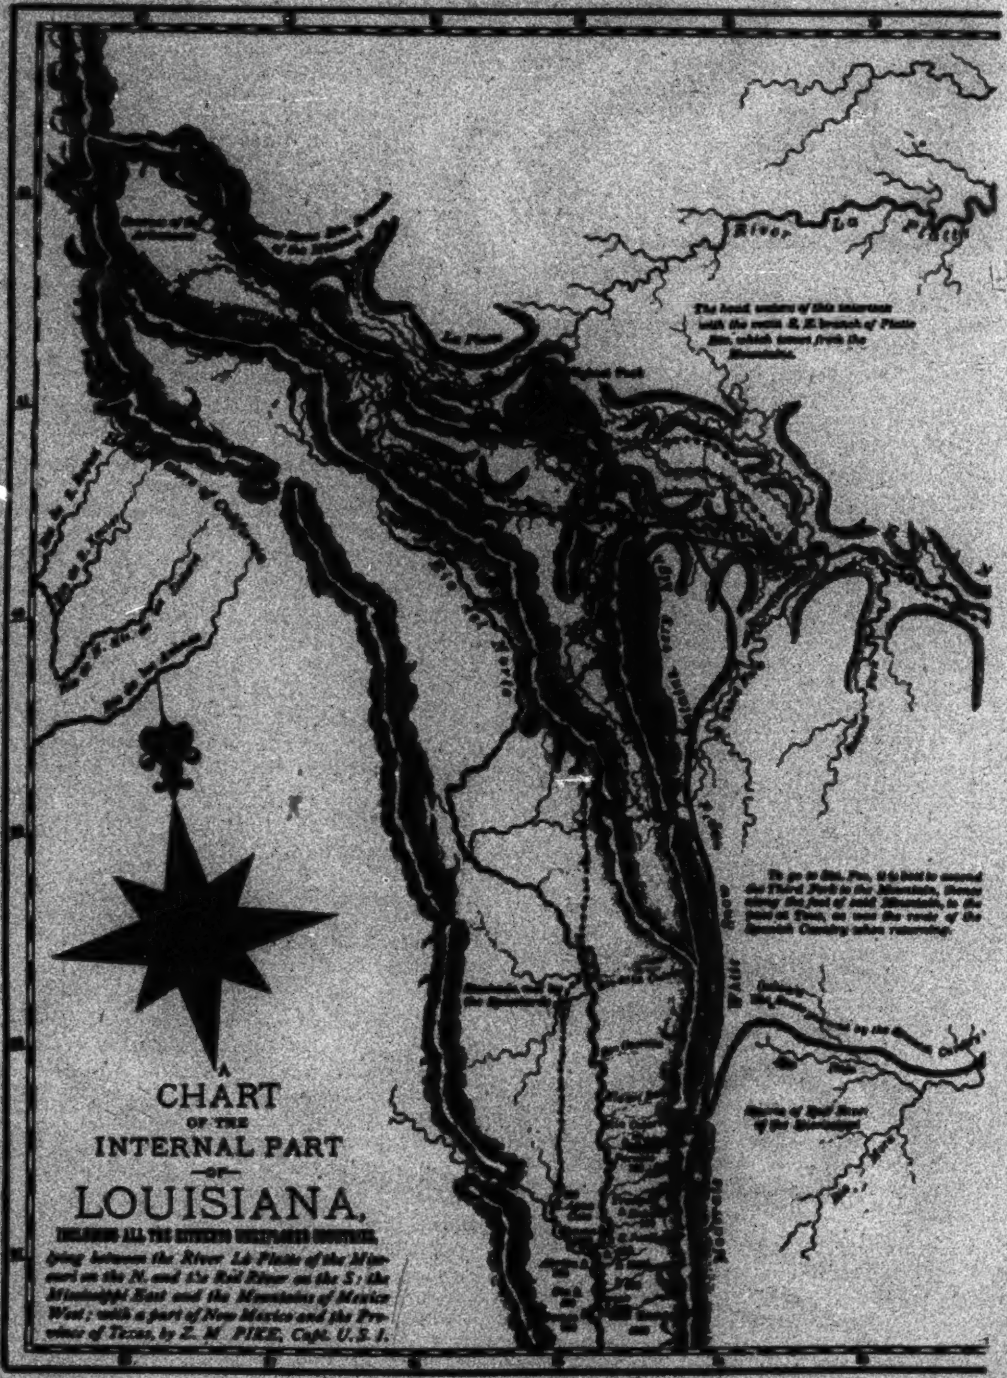
On November 24, after completing the "fort" and leaving a portion of his company to guard it and the supplies, Pike crossed the Arkansas and proceeded in a northwesterly direction toward the peak, expecting to reach it that day, but got only one-third of the way to it. Under date of November 25, he recorded:

"Marched early with expectation of ascending the mountain, but was only able to camp at its base, after passing over many small hills, covered with cedars and pitch pines."

They had reached the eastern ridge of the Colorado ranges, and the cold and snows of winter were now upon them. But, instead of having camped at the base of the great peak, they were at the base of Cheyenne mountain in front of it, and that mountain's base was about thirty-five miles from their "fort." The next day, the 26th, they commenced climbing the Cheyenne, supposing they were on the way to the top of the "Grand Peak." Of this day's experience Pike says:

"Expecting to return to our camp that evening we left all our blankets and provisions at the foot of the mountain. We commenced climbing up rocks, sometimes almost perpendicular; and after marching all day we encamped in a cave without blankets, victuals, or water."

The following day they reached the summit of Cheyenne and Pike was astonished when he found that he was not on the "Grand Peak," and that that lofty elevation was still some distance away. Of the prospect and conditions surrounding them he made the following record on November 27th:



River La Platte
A CHART
OF THE
INTERNAL PART
OF
LOUISIANA,
INCLUDING ALL THE HITHERTO UNEXPLORED COUNTRIES,
lying between the River La Platte of the Missouri on the N. and the Red River on the S.; the Mississippi East and the Mountains of Mexico West; with a part of New Mexico and the Province of Texas, by Z. M PIKE, Capt. U.S.I.

Western Part of Pike's Map.
(Dotted line indicates his wanderings in the Colorado Mountains; crosses marking his camping places. Small circles along Arkansas River mark camping places of Spanish cavalry.)

"Arose hungry and dry, and extremely sore from the inequality of the rocks on which we had lain all night, but were amply compensated for the toil by the sublimity of the prospect below. The unbounded prairie was overhung with clouds, which appeared like the ocean in a storm—wave piled on wave, and foaming, while the sky was perfectly clear where we were. Commenced our march up the mountain, and in about one hour arrived at the summit of this chain. Here we found snow

> middle deep; no sign of beast or bird inhabiting the region. The thermometer, which stood at nine degrees above zero at the foot of the mountains, here fell to four below. The summit of the Grand Peak, which was entirely bare of vegetation, and covered with snow, now appeared at the distance of fifteen or sixteen miles from us, and as high again as what we had ascended, and would have taken a whole day's march to arrive at its base, where, I believe, no human being could have ascended to its pinnacle."

Abandoning his intention to ascend the "Grand Peak" Pike and his companions started back to their "fort" on the San Carlos which they reached on the 29th, after two days' march.

The party left their "fort" at the mouth of the San Carlos on November 30th, and proceeded up the Arkansas, crossing to the north side of the river on December 2d. The weather turned very cold, and the men suffered severely. Pike says, under dates of December 1st and 3d, respectively:

> "The storm still continuing with violence we remained encamped; the snow was one foot deep. Our horses were obliged to scrape away the snow to obtain their miserable pittance, and to increase their misfortunes, the poor animals were attacked by magpies, who, attracted by the scent of their sore backs, alighted on them, and in defiance of their wincing and kicking, pecked many places quite raw. The difficulty of procuring food rendered these birds so bold as to light on our men's arms, and eat out of their hands."
>
> "The hardships of my last voyage now began to be again experienced, and had the climate been as severe as that to which I was then exposed, some of the men must have perished, for they had no winter clothing. I wore myself cotton overalls, for I had not calculated on being out at this inclement season of the year."

Nevertheless he went on that cold and stormy 3d of December and measured the "Grand Peak's" altitude. Of this he says:

> "Dr. Robinson and myself went out and took the altitude of the north mountain, on the base of a mile. * * * * The perpendicular height of the mountain, from the level of the prairie, was 10,581 feet, and admitting the prairie was 8,000 feet from the level of the sea, it would make the altitude of this peak 18,581 feet."

Both these elevations, as later ascertained, were much exaggerated, but wholly without intention. The error was more than three thousand feet. Pike was really not the discoverer of the peak. It had long been known by the Spaniards and, of course, by the Indians. Of this he says:

> "The mountain was so remarkable as to be known to all the savage nations for hundreds of miles around, and to be spoken of with admiration by the Spaniards of New Mexico, and was the bounds of their travels to the N. W. In our wanderings in the mountains from the 14th November to the 27th January, it was never out of our sight, except when we were in a valley."

While in that region Pike does not appear to have discovered the soda springs, as he does not mention them. He notes some springs which he says were "very strongly sulphurated," but says nothing of the "fontaines-qui-bouille."

From early in December, until the 5th of January, 1807, the party was almost aimlessly wandering around in the mountains, part of the time looking for traces of the Spanish force which was looking for them, and occasionally encountering their trail. The party became scattered, provisions gave out and, owing to the adverse chances of hunting, was, upon several occasions, without food for as long as two days. They were looking, also, for the Red river—which none of them found—down which they expected to return to the east. One of the small parties, coming unexpectedly upon the Arkansas again, took it to be the Red and cut the name of that stream in the rocks on the bank.

Pike had been charged with the discovery of the sources of the Red river, and during these four weeks, with the few of his now scattered command that were in his fraction of the party, he moved northward into the South Park region along or near the present traveled route until he came to a stream some forty yards in width, flowing northeast. This was the south fork of the South Platte, though Pike does not appear to have known what it was. He crossed it on December 13th and went ahead northwestward until he came to another stream, about seventy-five feet wide which "ran with great rapidity, and was filled with rocks." This stream, which he reached December 18th, he at first thought to be the Red river, but later concluded it was what we now know as the Yellowstone, and mapped and named it the "Pierre Juannor." It was one of the several mountain branches of the South Platte river.

Pike had only the exceedingly limited geographical knowledge of his time concerning the great west, none of which with relation to the Rocky Mountains region amounted to anything, and floundering around in the snow covered mountains and snow-drifted canons did not add rapidly to his store, nor was his failure to find the Red any discredit to him. In most of the localities he traversed that December he and his men were the first Americans who had set foot. While in the South Park he discovered that both white men and Indians with large numbers of horses, had very recently been there. Later, while at Santa Fe he learned something about who they were, but at that time this circumstance caused him some uneasiness. He appears to have anticipated that he would not be the gainer by falling in with the Spanish force with which he was playing a kind of hide-and-seek game.

However, on the 9th of January the party was re-united and back at the site of the camp of December 10th, from which it had separated into small groups on that day. Of this the leader says:

"The whole party was once more joined together, when we felt comparatively happy, notwithstanding the great mortifications I felt at being so egregiously deceived as to the Red river."

Pike now decided to build there "a small place for defense and deposit, and leave part of the baggage, horses, my interpreter and one man; and with the remainder, with our packs of Indian presents, ammunition, tools, etc., on our backs, to cross the mountains on foot, find the Red river, and then send back a detachment to conduct the horses and baggage after us." Accordingly "some were put to constructing block-houses, some to hunting," and otherwise preparing to carry out the new plan. This post was built on the north bank of the Arkansas river, a short distance below the mouth of Grape creek, and not far from the present site of Canon City.

On the 14th of January Pike started across the mountains, "our party, consisting of eleven soldiers, the Doctor, and myself, each of us carrying forty-five pounds, and as much provisions as he thought proper; which, with arms, etc., made on an average seventy pounds, leaving Baroney and one man, Patrick Smith, behind." They proceeded up the Wet Mountain valley or canon, and there in mid-winter, with neither clothing nor provisions sufficient to the conditions they encountered, had a hard time of it. Some of the men disabled by badly frosted feet, gave out, and Pike was compelled to leave them along the way in improvised shelters and with such provisions as could be spared, while he and the others pressed forward. He kept on up to the summit of the Sangre De Christo range where the San Luis Park and the Rio Grande lay before him down below; and Pike firmly believed he had found the Red river.

He descended to the valley and proceeded along the base of the mountains until he struck the Rio Grande where it sweeps inward toward them, and not far from the present site of Alamosa. Crossing that river he proceeded southward to the Conejos which he also crossed and went into camp on its southward bank at a point about five miles from its confluence with the Rio Grande, where Pike expected to remain until his scattered men could be re-united, and where he built another of his "forts"; its site having been on the present ranch of former Governor McIntire. The party reached this place on January 31st, most of the men in bad condition from frost-bites, exposure, fatigue from their long, rough journey with heavy burdens, and from hunger; for, while the place was alive with game, but few had been physically able to go hunting, and those who were, had a remarkable run of "bad luck."

Nevertheless, Lieutenant Pike was a firm believer in the maintenance of discipline. On one of the closing stages of this part of the journey where "the snow became so deep as to render it impossible to proceed," one of the men gave vent to his feelings. "It was," says Pike, "the first time I heard a man express himself in a seditious manner. One had exclaimed, 'that it was more than human nature could bear to march three days without sustenance, through snows three feet deep, and carry burdens fit only for horses.' As I knew very well the fidelity and attachment of the majority of the men, and even of this poor fellow, only he could not endure fasting, and that it was in my power to chastise him when I thought proper, I passed it over for the moment, determined to notice it at a more auspicious time."

The Doctor and Pike managed to kill a buffalo that evening before they made camp, "to the joy of our brave lads, who immediately feasted sumptuously." After the feast Private Brown received the attention of his commander for his previous expression of dissatisfaction with some features of the excursion. We quote from Pike:

> "After our repast I sent for the man who had presumed to speak discontentedly during the day, and addressed him as follows:
>
> 'Brown, you this day presumed to make use of language which was seditious and mutinous; I then passed it over, pitying your situation and attributing your conduct to your distress, rather than your inclination to sow discontent amongst the party. Had I reserved provisions for ourselves, whilst you were starving; had we been marching along light and at our ease, whilst you were weighed down with your burden, then you would have had some pretext for your observations; but when we were equally hungry, weary, emaciated and charged with burdens which I believe my natural strength is less able to bear than any man's in the party; when we are always foremost in breaking the road, reconnoitering and enduring the fatigues of the chase, it was the height of ingratitude in you to let an expression escape which was indicative of discontent. Your ready compliance and firm perseverance I had reason to expect, as the leader of men who are my companions in misery and danger. But your duty as a soldier called on your obedience to your officer, and prohibition of such language, which for this time I will pardon; but I assure you, should it ever be repeated, by instant death will I revenge your ingratitude and punish your disobedience. I take this opportunity likewise to express to you, soldiers, generally, my thanks for your obedience, perseverance, and ready contempt of every danger, which you have in common evinced; and assure you nothing shall be wanting on my part to procure you the rewards of our government and the gratitude of your countrymen.'
>
> "They all appeared very much affected, and retired with assurances of perseverance in their duty."

We quote this to show the determined character of Pike rather than for any importance the incident possesses. However, and perhaps in defiance of the need for discipline in military affairs, the sympathies of the commiserating reader will probably go out to poor Private Brown, and find some justification for his discontent.

Pike built his "fort" there on the north bank of the Conejos—which he enters on his map as the "Rio de la Culebra." The structure was to serve him until he was prepared to begin his descent to the Mississippi by way of the Red river which he supposed the Rio Grande to be. He describes it thus:

> "The stockade from the center of the angles of the bastions was thirty-six feet square. There were heavy cottonwood logs about two feet in diameter, laid up all around about six feet, after which lighter ones until we made it twelve feet in height. * * Lastly, we had dug a ditch around the whole four feet wide, and let the water into it; the earth taken out being thrown against the work, formed an excellent rampart against small arms, three or four feet high. * * Thus fortified, I should not have had the least hesitation in putting the hundred Spanish horse at defiance until the first and second night, and then to have made our escape under cover of darkness; or made a sally and dispersed them, when resting under the full confidence of our being panic struck by their numbers and force."

Pike ran up his flag over his "fort," and his account is the first record of it having floated over any of the soil now included in the limits of Colorado.

On February 7th Dr. Robinson left the party and set out alone for Santa Fe; "having," as Pike puts it, "some pecuniary demands on the Province of New Mexico, conceived this to be the most eligible point for him to set out from, in order to return previously to all my party having joined me from the Arkansaw, and before I could be prepared to descend to Natchotoches." The "pecuniary demands" were the claims against La Lande, which Pike also endeavored afterward to collect while a semi-prisoner at Santa Fe. On this same day Pike "dispatched Corporal Jackson with four men to recross the mountains, in order to bring in the baggage left with the frozen men, and to see if they were yet able to proceed."

Pike now had but four men with him on the Conejos "thinking we were on the Red river, and of course in the territory claimed by the United States."

On the 16th of February two Spanish cavalrymen who were scouting around looking for the party, came to the "fort," and after being kept over night went away again without having caused their host any trouble. On the 17th the Corporal and three of the men arrived, and two more came in the next day. Two of those left on the trail were unable to travel. Pike says:

> "They sent on to me some of the bones taken out of their feet, and conjured me by all that was sacred, not to leave them to perish far from the civilized world. Oh! little did they know my heart if they could suspect me of conduct so ungenerous! No, before they should have been left I would for months have carried the end of a litter."

Pike immediately sent two men back over the long journey to the old camp on the Arkansas where two men, the horses and supplies had been left, with orders to bring everything across to the Conejos and to pick up the disabled men as they came along.

On the 26th of February a troop of one hundred Spanish cavalry made its appearance at the "fort" and took charge of the expedition. There was no conflict over the change of jurisdiction. We quote again:

> "The commanding officer addressed me as follows: 'Sir, the Governor of New Mexico, being informed that you had missed your route, ordered me to offer you in his name, horses, mules, money, or whatever you may stand in need of, to conduct you to the head of Red river; as from Santa Fe, to where it is sometimes navigable, is eight days' journey, and we have guides and the routes of the traders to conduct us.'"
>
> "'What,' interrupted I, 'is not this the Red river?' 'No, sir, it is the Rio del Norte.' I immediately ordered my flag to be taken down and rolled up, feeling how sensibly I had committed myself in entering their territory, and was conscious that they must have positive orders to take me in."

So ended the notable expedition of Lieutenant Zebulon M. Pike. Leaving two of his men and a squad of the Spanish cavalry to await the arrival of those who were still behind on the trail, Pike and the rest set out for Santa Fe that day, escorted by their polite captors. Pike was courteously received and hospitably entertained by Governor Alencaster, the Spanish Executive for New Mexico, but felt that he was a prisoner. We shall not undertake a narrative in detail of his subsequent experiences down there. From Santa Fe he and part of his men were sent to El Paso, and from there to Chihuahua. Then they were taken northeastward through Mexico—with assurances all the time that they would be escorted safely to the American frontier—up through what is now Texas to the Spanish post Nacogdoches, whence they passed across to Natchitoches on the Red river, and in what was then Orleans Territory, which they reached on July 1, 1807.

Pike was well treated, and his detention was marked more by courtesies due a guest than harshness often shown a prisoner. But many of his valuable papers were lost, or retained by the Spaniards, and whatever were the motives of his superior in ordering him to the undertaking, it would seem to have resulted in nothing of great consequence. For some time afterward it was the subject for acrimonious discussion, and some circumstances associated with it were never cleared from the taint of suspicion. However, these things became reminiscences when the second war with England engaged the attention of the Nation.

The exact route Pike followed from his block house on the Arkansas across the Sangre De Christo Mountains is difficult to certainly identify. His original geographical notes having been lost after he fell into the hands of the Spaniards, his map was drawn partly from the entries in his diary, and partly from rough Spanish maps which he adapted to the purpose. His maps shows his route to have been up the Wet Mountain valley. Whether the pass by which he crossed the summit was the Mosca or the Modena—the latter also known as the "Sandhill," or whether it was one still farther north, is not certainly known. The Mosca was frequently followed by the Southern Utes before and after Pike's time on their visits to the plains, and their "hieroglyphics," of which Pike speaks, were to be seen cut in the trees. But as Pike, after reaching the San Luis valley, went for some distance between the mountains and the sand dunes on his march southward, it would seem that he went through the Modena pass. But, according to old Spanish and Mexican accounts, the capturing party understood that Pike crossed by what is now known as the Sangre-de-Christo pass.

Pike's report on the physical character of the country was generally favorable. Of the beautiful San Luis Park he said:

> "From a high hill south of our camp we had a view of all the prairie and rivers to the north of us. It was, at the same time, one of the most sublime and beautiful inland prospects ever presented to the eyes of man. The prairie, lying nearly north and south, was probably sixty miles by forty-five. The main river, bursting out of the western mountain, and meeting from the northeast a large branch which divides the chain of mountains, proceeds down the prairie, making many large and beautiful islands, one of which I judge contains 10,000 acres of land, all meadow ground, covered with innumerable herds of deer. In short, this view combined the sublime and beautiful. The great and lofty mountains, covered with eternal snows, seemed to surround the luxuriant vale, crowned with perennial flowers, like a terrestrial paradise shut out from the view of man."

Of the country east of the Rocky Mountains down to the Mississippi, he recorded these opinions:

> "In the western traverse of Louisiana the following general observations may be made, viz: That from the Missouri to the head of the Osage River, a distance in a straight line of probably three hundred miles, the country will admit of a numerous, extensive and compact population. From thence, on the Rivers Kanzes, La Platte, Arkansaw, and their various branches, it appears to me to be only possible to introduce a limited population on their banks."

He then recounts most intelligently the value of the great plains for stock-raising, mentions the disadvantages to result from the lack of timber, and goes on to say:

> "But from these immense prairies may rise one great advantage to the United States, viz: The restriction of our population to some certain limits, and thereby a continuation of the Union; our citizens being so prone to rambling and extending themselves on the frontiers, will through necessity be constrained to limit their extent in the West to the borders of the Missouri and Mississippi, while they leave the prairies, incapable of cultivation to the wandering and uncivilized aborigines of the country."

Notwithstanding the instructions from General Wilkinson that he should "collect and preserve everything curious in the mineral and botanical worlds," the possibility of the "Grand Peak" region containing gold or silver does not appear to have suggested itself to Pike while he was in it, and he gave none of his time and attention to such matters; nor does he seem to have regarded Pursley's story afterward told him as of any great significance or consequence. He mentions it more as an incident of his journey than as a discovery that it might be well to investigate; and when his report was published the incident occasioned little public comment.

For its time Pike's expedition was a great undertaking, and called for intrepidity and endurance. While in United States territory he encountered no white men, the hunters and trappers not yet having established themselves in the region. The Indians do not appear to have given the party any trouble.

Pike was the son of Zebulon Pike, of New Jersey, a Revolutionary officer, and was born at Lamberton, near Trenton, New Jersey, January 5, 1779. His father continued in military service, and the son at the age of twenty became an Ensign in his father's company. He was afterward, at the age of twenty-six, made a Lieutenant, and when he started on his noted expedition was serving under General Wilkinson, with headquarters at St. Louis.

In recognition of his services, Pike was promoted to be a Major in the United States army, after his return. In later years when the facts of his expedition became generally known the great mountain which he called the "Grand Peak" became by common consent and popular approval "Pike's Peak." When Fremont came to the mountains he found the frontier people calling it "Pike's Peak," notwithstanding that it had in the meantime been designated as "James' Peak."

Major Pike served capably in the first and second years of the war of 1812 with England, and by promotions through various gradations became a Brigadier General, March 12, 1813. He was with General Henry Dearborn who was in command of the American forces which invested and captured York (now Toronto,) Upper Canada, in that year; and at that place, in action, lost his life by the explosion of a powder magazine.

His narrative of his expedition to the sources of the Mississippi, and of this more trying one to the Rocky Mountains, bears, after the quaint fashion of his time, the long title: "An Account of Expeditions to the Sources of the Mississippi and through the Western part of Louisiana [etc.] in the years 1805, 1806 and 1807." It is one of the notable narratives of explorations made in the early years of that century.

CHAPTER XIV.

Long's Exploring Expedition—Its Arrival at the Mountains—Passing the Site of Denver—At the "Grand Peak"—Return Homeward—Adverse Impressions Arising from Reports of the Expedition—Bonneville's Expedition—Fremont's Celebrated Expeditions—Disasters that Befell the Fourth—Subsequent Military and Other Expeditions Into the Rocky Mountains—Frontier Military Posts.

After the Spanish treaty of 1819 ceding Florida to the United States and defining the Spanish boundaries here in the west-southwest had been agreed upon at Washington, the third exploring expedition to the Rocky Mountain country, under official auspices, was organized by John C. Calhoun, then Secretary of War. It was more complete in its preparations and equipment than either of the preceding ones, and in the company were several army officers, a contingent of naturalists, botanists, topographers and geologists, pieced out with one corporal, and six privates of the United States army, a couple of French Canadian frontiersmen, and several other civilian employees.

It was commanded by Major Stephen H. Long, of the United States army, and with him were Major Biddle, Lieutenant J. D. Graham, and Cadet W. H. Swift. Among the professional contingent were Dr. Baldwin, Dr. Thomas Day, and Dr. E. James who became the historian of the enterprise and was also a botanist. The purposes of the expedition were to explore the Mississippi above the mouth of the Missouri, then the Missouri and its main tributaries, and finally the country of the headwaters of the Arkansas and Red rivers so as to learn something definite about the region on our side of the newly-established Spanish boundary line.

The expedition left Pittsburgh on a steamboat, May 30, 1819, voyaging down the Ohio and up the Mississippi to St. Louis. The operations of the party during the summer months are not of consequence in this account, and may be omitted here. In the autumn the expedition had reached a point on the Missouri about twenty-five miles north of the mouth of the Platte river, which was called Council Bluffs, but it was not at the later site of the Iowa city of that name, being some fifteen miles farther up, and on the Nebraska side. The place was later occupied by old Fort Calhoun. There the company made quarters for the winter and stayed until the following spring, in the meantime making friendly acquaintance with the Indians and learning what could be learned of the western country from them, as it had been deemed inexpedient to attempt even the preliminary stages of the journey across the plains with winter coming on. The Indians near their encampment regarded the proposed enterprise as a most hazardous one and predicted every kind of misfortune for it.

The spring of 1820 was what is called a "late" one, and it was not until the 6th of June that Major Long left his winter encampment and started across the plains. He proceeded to the Platte river which he followed westward by easy stages to its great forks and then turned off this way along the South Platte; and by midsummer was nearing the site of Denver. The first view these people had of the magnificent mountain ranges was on June 30th, in the morning of a most beautiful day. Long's Peak, or the one that was soon named for the commander, was ahead of them, and far to the southward the snowy summit of Pike's "Grand Peak" glistened in the rays of the morning sun.

On the 3d of July the company went into camp on the bank of the South Platte, opposite the mouth of the Cache-a-la-Poudre river. The great peak to the west of them and which was the first they had observed from the plains, holding its whitened head in the clouds, was then named in honor of Major Long. In his report Long says the South Platte's tributary opposite the mouth of which he made camp, was then called the "Pateros" in remembrance "of a Frenchman of that name who is said to have been bewildered upon it, wandering about for twenty days, almost without food. He was found by a band of Kiowas who frequent this part of the country, and restored to his companions, a party of hunters at that time camping on the Arkansas." The identity of that Frenchman was never ascertained.

From the "Pateros" the company moved up the South Platte, and on the 5th of July went into camp at the place which subsequently became the site of Fort Lupton—a trading post. Up to this time no attempt had been made to approach nearer to Long's Peak, but now Dr. James and several others of the party started toward it. They were as much surprised as Pike had been by his similar experience, for, after tramping a half day, they seemed but little nearer its base than when they started; so they went back to camp, and the peak was left unexplored.

They left the Lupton camp on the 6th of July, continuing up the South Platte, over the ground on which the east side of Denver is built, and on to the mouth of Platte canon where the river breaks away from the mountains. Here they made a brief stop, and then followed Plum creek to the summit of the divide and thence along Monument creek to the Fontaine-qui-Bouille which Long at once named the "Boiling Spring creek," which is simply the English for its present and preferable French name. Passing over to the site of Manitou the company went into camp again.

From this Manitou camp Dr. James and two other members of the party started to ascend the "Grand Peak." They failed to reach its summit, as they encountered a mass of "slide rock" when almost at the top, and could not find a way to get over the obstruction. Upon the return of Dr. James from this adventure Major Long named the peak in his honor. The Doctor then measured its altitude, and assuming a point on the Fontaine-qui-Bouille, twenty-five miles below the springs, to be three thousand feet above the sea level, made the peak's height eleven thousand, five hundred and seven feet. He, as will be seen, was in serious error in so greatly underestimating the elevation of his base.

Leaving the Manitou camp the party went on down to the mouth of the Fontaine-qui-Bouille where "the Pueblo" was built about twenty years later. Turning up the Arkansas its course was followed to the mineral springs above the site of Canon City where camp was again made. While on the Fontaine and the Arkansas up to their camp, search was made for traces of Pike's visit to the region, but all evidence of his former camping places had disappeared.

On the 19th of July Major Long and his company left the mountains on their homeward journey. They proceeded down along the northward side of the Arkansas river until they came to longitude one hundred degrees, west, which, intersecting the Arkansas, became part of the Spanish boundary. Turning southward and keeping on the American side of the line they passed over to the Red river, down which they made their way to the end of their long and most interesting expedition, without having had any misfortunes, and avoiding all trouble with the Indians through whose countries they had passed.

The Long expedition acquired much valuable geographical and scientific knowledge of the western country, but the official reports growing out of it and the subsequent distorted and exaggerated versions of them given to the public, delayed for years the settlement and development of the great domain between the Missouri river and the Rocky Mountains. The reports stated that practically everything east of the mountains and nearly to the river in the broad belt between the thirty-ninth and forty-ninth parallels of latitude, was a desert of sand and stones, worthless for agricultural purposes, and having no other value to compensate for that deficiency. The beauty and grandeur of the mountains were extolled, but they were not represented as having any desirable qualities other than those of being grand and beautiful in the pleasant days of summer.

Stephen H. Long. (Photographed in 1862.)

Then followed the distortions and exaggerations. The "Great American Desert," blanking about all the country from the Missouri to the Rockies, appeared on the maps and in the schoolbooks. Imaginative writers wrote weird stories of its desolate aspects, on the basis of the Long reports; and the same documents inspired picture-makers to some most extraordinary performances. The whole country drained by the Missouri, the Platte, the Arkansas, and their tributaries was represented as a hopeless waste, uninhabitable and worthless. The few people who were still sanguine that some good might be found in it, were overwhelmed and silenced by the vast majority which believed that Major Long's scientific expedition, and its scientific observations and conclusions had settled its fate forever.

The unscientific men who came into it later, thought they saw things differently, and bravely went to work on that theory. To this day there are people living along the Atlantic sea-board who inherited the adverse impressions, and are not yet convinced that western folks are not concealing that "desert" for some bad purpose.

Although Major Long named the "Grand Peak" in honor of Dr. James, and that it was so referred to in the official reports, the name did not withstand the popular preference for that of General Pike, by which, after the traders came to the country, it soon became generally known. Dr. James wrote and published an interesting account of the expedition but copies of the four small volumes in which it appeared are now very rare. His memory is still further preserved in another fine peak of the Rockies which was bestowed upon it in later years; and that of Lieutenant Graham, of the Long party, in the name of another lofty eminence in the Colorado ranges. To Major Long a magnificent mountain monument looks down in grandeur over the region of which he formed such mistaken conceptions, and to which he gave, in his official accounts, an undeserved evil reputation that afflicted it for many years. He died in Washington in September, 1864.

In 1832 an expedition fitted out by the American Fur Company was sent to the Rocky Mountains under command of Captain B. L. E. Bonneville, of the United States army, who was granted leave of absence for that purpose. This was more of a commercial prospecting enterprise than of exploration for exploration's sake, though its commander was an enthusiast on the great natural resources he believed the western country possessed. He crossed the plains of Kansas and went to the Platte river which he struck at Grand Island. He followed the Platte by way of the north fork into the mountains and then continued westward. His leave was for eighteen months, but as he was gone three years, he and his party were supposed to have been extinguished by the Indians, and his name was dropped from the army rolls. Captain Bonneville claimed to have been the first man to prove that the great rivers flowing east and west from the Rocky Mountains, had their sources very near together. From Bonneville's account of his expedition Washington Irving derived inspiration and information for one of his interesting volumes.

In 1830 Irving visited the Arkansas river country in company with a large party of hunters which went to Fort Gibson, then a remote frontier army post on the Neosho river, and from there to the Canadian river. But the enterprise was without significance or importance.

After Long's, the United States government sent no more exploring expeditions to the Rocky Mountains until 1842, when the first of the series made by John C. Fremont entered this western country. Fremont's brilliant career covers many pages of National history. At this time he was a Lieutenant of Engineers in the United States army, having been appointed from civil life by President Jackson.

The ostensible purpose of his first expedition was to discover a shorter and better route, than any then known, to the Oregon country; to select locations for a chain of military posts along it, for the protection of the American fur companies from the persistent encroachments of the Hudson's Bay Company, and to encourage American emigration to the Columbia river country, the beginnings of which had already been made, by affording proper military protection along the route.

As an exploring expedition there was, in one sense, not much for it to do, for the whole region had previously been tramped over by the trappers, traders, and adventurers. But Fremont was afterward tremendously exploited throughout the east, and a halo of romantic and perilous adventures was thrown around this and his subsequent achievements. He was called the "Pathfinder," but Kit Carson, who was the chief guide of this and another of Fremont's undertakings, had, as had the other scouts and guides, found the paths years before, and therefore there was little trouble in showing the leader where they were.

But Fremont and his people braved many dangers, and endured great hardships on one of his expeditions, all of which, however, grew out of climatic conditions that should have been avoided. Each of his expeditions was thoroughly organized and as well-equipped as foresight and a liberal appropriation could make it. This first one comprised twenty-two men, most of them experienced frontiersmen. It made no discoveries of importance in Colorado, because it did not go where any had been left to be made.

Fremont departed from St. Louis, going up the Missouri river by boat, to Choteau's Landing, near the mouth of the Kansas river. From that place he started westward on June 10, 1842, proceeding along the south bank of the Kansas several days march, when he crossed to the Blue river, from which he soon diverged northwestward to the Platte, which he reached near Grand Island, and where he halted for several days. From this point he went westward along the Platte until he came to the great forks of the river, where he arrived about the 1st of July.

Here Fremont divided his command, sending the larger portion of it onward to Fort Laramie, then a trading post of the American Fur Company, which had been built in 1834 by William Sublette and Robert Campbell, and which they first called Fort St. John. With the remainder of his command Fremont proceeded up the South Platte, coming within sight of Long's Peak on July 8th, when he was about sixty miles distant from the mountains' base. He continued up the South Platte to St. Vrain's trading post, which was as near as he came to the site of Denver on that expedition, and where he remained three days.

On July 12th he started northward to Fort Laramie, having barely touched what is now Colorado. On the way to Laramie he met "Jim" Bridger, a famous frontiersman, who warned him of the probability of serious trouble with the Indians, and alarmed most of the company; but there was no trouble.

On Fremont's operations in the Laramie region that summer, Bancroft in his "History of Wyoming," makes the following biting comments:

> "He was to connect his explorations with those of Wilkes on the Pacific coast, but did nothing further this year [1842] than to make a summer jaunt to the South Pass, which, being a military officer and not a private citizen, trader, trapper, missionary, immigrant, or what not, he "discovered," naming its altitude and ascending the highest peak in the Wind River range, 13,570 feet, planting thereon the United States flag. This mountain he named Fremont's Peak; and considering that the government paid all the costs, and that he had an experienced mountain-man, Kit Carson, for a guide, it must be admitted that the eternal mountains might be put to nobler use than to perpetuate such achievements."

Old Senator John W. Nesmith, one of Oregon's first pair of United States Senators, in speaking of Fremont's "discovery" of the South Pass to some friends in Washington soon afterward, said the old Oregon and Utah trail through the Pass at the time of the "Pathfinder's" first visit was a roadway as plain and well-defined as Pennsylvania Avenue; that he encountered Fremont in the Pass, and saw the "explorer-discoverer" lolling in a covered ambulance drinking lemonade which his colored attendant prepared for him, and being fanned by the same considerate person.

Fremont returned by way of the North Platte to the Platte, down which he went to the Missouri, and thence to St. Louis, and on to Washington, where he made his report. Not without criticism and objections, he received authority for a second expedition.

This one was organized at Westport Landing, now included in Kansas City, in the spring of 1843, and comprised thirty-nine persons. It was lavishly equipped, and provided with a small piece of artillery. Soon after he had left Westport, an order was issued at St. Louis, recalling him; but his wife, a daughter of Senator Benton, of Missouri, into whose hands it fell, suspecting its purport, prevented it being forwarded to her husband. Fremont proceeded across the plains by way of the Kansas river valley and that of the Republican fork, and thence almost directly west to Fort St. Vrain, along the well-worn trails of the fur companies, arriving at St. Vrain on July 4, 1843.

Soon after he had left Westport Landing Fremont was joined by William Gilpin, our later Territorial Governor of Colorado, who as Fremont states, "intending this year to visit the settlements in Oregon, had been invited to accompany us, and proved a useful and agreeable addition to the party."

On the 6th of July Fremont and his party left St. Vrain and started up the South Platte, observing Pike's Peak, covered with new-fallen snow, on the morning of the 10th. When they came to the mouth of Cherry creek they halted and made camp, several hundred Arapahoe Indians being encamped here at the same time, and receiving the visitors with every mark of friendly Indian hospitality. From here Fremont proceeded up Cherry creek, and crossed over to the Bijou, whence he went to the Fontaine-qui-Bouille and followed that stream to its mouth, where he camped near the old Pueblo, the dwellers in which received him and his company with most hospitable welcome. At the Pueblo, he found Kit Carson who again became his guide and counsellor.

John C. Fremont. (From a civil-war-time photograph.)

From the Pueblo he returned northward along the Fontaine and followed it to the present site of Manitou where he found the famous springs, the waters of which delighted him and all his company. From there Fremont passed into the South Park and on into the North Park, from which he went down to St. Vrain. Leaving St. Vrain he proceeded northward to the North Platte, thence across the mountains, on to Salt Lake and from there to the Columbia river country.

While Fremont and his party were at the "Pueblo" and in the mountains, they, also, searched for some traces of Pike's expedition but saw nothing that could be identified.

In 1844, on his return journey, his course brought him into what is now the northwestern corner of Colorado, through the North Park, which he called "New Park," through the South Park, which he found "alive with buffalo and other game," and down to the Arkansas river, along which he proceeded eastward, reaching St. Louis in the autumn of that year. In recognition of his services in so successfully conducting this expedition, President Tyler advanced him to the rank of Captain of Engineers.

Fremont measured the elevation of the Ute Pass when he passed through it and found it, according to his calculations, to be eleven thousand, two hundred feet. He also measured the height of Pike's Peak, making its altitude fourteen thousand, three hundred feet, which agreed very well with the measurement made by Dr. Parry in 1862, and was but one hundred and twenty-eight feet in excess of the present accepted altitude of fourteen thousand, one hundred and seventy-two feet.

About the only white people Fremont encountered in the Colorado mountains on this expedition were the few remaining traders and trappers and their former employees, some of whom were then trying to be settlers and were living with their Mexican or Indian "wives" and mongrel children, in a most primitive mode of life, usually in rude structures which they proudly called "forts."

In this undertaking, and in those which he afterward set on foot, Fremont was never seriously troubled by the Indians, although several of the tribes were disposed to be hostile in all of those years.

Though much was made of this mountain-crossing achievement of Fremont's well-found expedition, other men had done the same thing before his time, some without special preparations and under the hard conditions of winter. In the first decade of the century two Americans made the passage a little to the south of Fremont's route, the circumstances of their journey appearing in the succeeding chapter. In the dead of the previous winter, that of 1843-44, Rufus B. Sage, an old mountain-man, with a small party of other trappers, crossed from the west on about the same route as this one followed by Fremont. On the Arkansas about thirty miles above the Fontaine-qui-Bouille, and somewhere near the site of Canon City, these men came across a settlement of fifteen or twenty families of white men, Indian squaw mothers, and numerous half-breed children. These expatriated men were not disposed to be friendly with semi-occasional visitors of their own kind and color, and most of them were of the same class as those Fremont encountered in several places along his route.

In the spring of 1845 Fremont set out on his third expedition. This one, like the others, was finely equipped and provided for by the government. The object was to explore the great interior basin west of the Rocky Mountains, and it did not involve any very important work in what is now Colorado. The ulterior purposes back of this and the enterprise of 1843-44 were to learn if a railroad possibly could be built through the Rocky Mountains, an undertaking which was in those years, beginning to be seriously considered. Fremont crossed the plains to Bent's Fort on the Arkansas, thence up that stream to its headwaters and across into Utah.

After his return from this third expedition Fremont resigned his position in the army. At that time the people of St. Louis were intensely interested in the probability of a railroad being built across the continent, and were ambitious to have it constructed on a general line due west from that city. Therefore they determined to make a practical survey through these mountains, on their own account. Fremont's services as leader were enlisted and he organized the expedition, the expense of supplying and equipping it being paid by contributions from St. Louis merchants and business men, with a liberal donation from his own private resources.

This fated expedition left St. Louis about the first of October, 1848, crossing the plains on a route farther to the south than those followed by Fremont's previous enterprises, and which brought it to Bent's Fort on the 17th of November. Fremont at once prepared to push forward into the mountains, notwithstanding the warnings of the severe conditions existing even that early in the wintry season, that he received from mountain-men and Indians then at Fort William—"Bent's Fort." But Fremont determined to go on, and after obtaining fresh supplies and additional pack animals there, he left that post with thirty-three men in his company, and one hundred and twenty pack-mules carrying supplies and equipage. He moved up the Arkansas river into the mountains, but instead of Kit Carson, he this time had for a guide, the old trapper, Bill Williams, who joined him at Fort William. Perhaps if he had had Carson the consequences would have been less disastrous, but Williams claimed afterward that his advice and judgment were disregarded by Fremont.

Into the mountains Fremont and his party plunged and were soon floundering in deep snows, with the weather bitterly cold. They crossed the divide and headed to the southwest. On the 19th of December they were, as Fremont afterward stated, "at the north of the Del Norte canon where that river [the Rio Grande] issues from the St. Johns [San Juan] mountains, one of the highest, most rugged and impracticable of all the Rocky Mountain ranges, inaccessible to trappers and hunters, even in the summer time." This in the dead of an unusually cold and stormy winter, with the snow waist-deep almost everywhere.

Losing their way, they had wandered aimlessly around whenever they could do so, trying to find it. Many of the men were badly frozen, pack animals died, and despair settled down on the devoted company storm-bound there in the mountain elevations twelve thousand feet above the sea.

Finally they broke their way out and down to or near to the Rio Grande, with the remnant of their supplies and outfit borne by the few pack-mules that had survived the ordeal, and went into camp at a point believed by many Colorado pioneers to have been well up on what is now known as Embargo creek, an affluent of the Rio Grande a few miles above Wagon Wheel Gap. While it is not certainly known that Fremont's "Camp Starvation" was situated on that creek, it is more than probable that it was. Supplies had run very low by reason of so much of the outfit having been abandoned along the route. Four men volunteered to go to the nearest Mexican settlement for assistance, and started down the valley of the Rio Grande. After waiting for sixteen days and not hearing from them, Fremont and his party started southeastward to search for them. Six days later he came up with three of them, emaciated and almost dead from hunger and exposure. It appeared that the four men had lost their way, consumed the small stock of provisions with which they started, and the leader, named King, had subsequently perished from cold and starvation. His surviving companions were most pitiable looking objects when Fremont found them.

Fremont then determined to push on southeastward to the Mexican settlements, and finally reached Taos, where Kit Carson and his family were then living, and who gave him a warm welcome. The survivors came straggling into Taos for several days after their leader's arrival there, hungry, frost-bitten, and tattered. Eleven of the company of thirty-three that had marched away from Fort William about three months before, had been left dead in the storm-swept mountains; and the trail was littered with the wreckage of abandoned property and frozen carcasses of pack-mules.

Ceran St. Vrain, the frontier trader, was then at Taos on his way from Santa Fe to the Missouri river, and bore away Fremont's famous letter to his wife in which was so eloquently and thrillingly told the story of the party's frightful experience and suffering in the Rocky Mountains in that memorably severe winter of 1848-49.

Fremont went from Taos, accompanied by some of the survivors of his party, through New Mexico and on to California by a route farther to the south than the one on which he had with the utmost difficulty escaped with his life. After his arrival there he became identified with political affairs, with consequences that made him a conspicuous figure in that new land of gold, and which were historic events in the annals of that State and of those of the Nation. He died in Washington July 13, 1890.

Fremont's route after crossing the divide has never been satisfactorily determined. His records made on those stages of his journey were lost in the mountains, and with them went his instruments and other paraphernalia. The party became bewildered so far as definite knowledge of localities was concerned, except that it was known by Fremont to be near the headwaters of the Rio Grande.

The report of a brief interview with a citizen of Monte Vista, in which this obscurity of Fremont's trail was mentioned by him, being printed in the Denver Times in its issue of March 1, 1899, brought the following interesting communication from a gentleman residing at Ouray, and which he thought might throw some light on the obscurity to which we have alluded. This is from the Denver Times, of date March 10, 1899:

"POSSIBLY FREMONT'S CAMP."

"Ouray, Colo., March 3.—To the Editor of The Times:—The statement of H. W. Green, quartermaster at Monte Vista, published in your issue of March 1, that Fremont's route, or camping place that winter would likely never be known, induces me to write you this description of a camp we found seven miles below Ouray on the west side of the Uncompahgre river, and at the mouth of what is now Coal creek, early in the spring of 1876. Built around a circle fifty feet in diameter were six stone fireplaces, the arches of some of them still standing at that time. The spaces between were filled in with logs set on end, the burnt stumps of which were still there, while scattered round were water troughs, feed troughs, camp stools, bowls, etc., hewn out of logs, and many other rough utensils; also quite a number of pieces of iron and woodwork belonging to wagons, such as tires, broken wheels, in fact everything that would belong to a large, well equipped party such as Fremont's. In the mouth of Coal creek we also found a rough rocker, where the party had done some prospecting for gold. If you think this would help throw any light on the matter, use it as you please. Respectfully yours.

JOHN BUCKLEY."

But the fact that Fremont had no wagons with him on that expedition across the mountains, indicates that the camp wreckage observed by Mr. Buckley had been left by some other party, though the wagon relics might have been added by some later visitors to that locality, which is some distance to the west of Wagon Wheel Gap. Captain Gunnison was in that general region on his surveying expedition a few years after Fremont, and this camp may have been one of his. Fremont carried his supplies and equipage into the mountains on pack-mules.

Furthermore, it is possible that this old camp may have been one occupied by Lieutenant J. H. Simpson's expedition. In the years 1846-47-48, at the close of the Mexican war, Simpson made a military reconnoissance out into the west which led him into southwestern Colorado. In his report of this expedition we have the first record of the ruined habitations in that region having been visited by Americans. Simpson moved leisurely on his way, making topographical and geological observations as he proceeded, as collateral additions to the military character of his enterprise. Aside from his observations of some of the less important remains of the Cliff Dwellers' structures, his expedition was without results of much historical value or importance.

Buffalo Hunt by Fremont's Party. (Fremont's Memoirs.)

In 1851-52 the Comanche Indians were troublesome, and in the spring of the last named year a regiment of mounted United States troops under command of Colonel Sanborn was sent to their country to curb their depredations, which were, to a great extent, upon other tribes. Colonel Sanborn proceeded from Fort Leavenworth across to the Santa Fe trail, thence to its Arkansas river crossing. He then followed the river up to the Pueblo, thence up the Fountaine-qui-Bouille to the springs, where he made camp. He had had no encounters with the Comanches, and after a rest in camp started northward, crossing the Platte-Arkansas divide to Cherry creek, and came down here to its mouth where he again made camp for several days. From this point he proceeded northward to Fort Laramie which he reached without noteworthy adventures.

In 1853 Fremont conducted a government survey for a Pacific railroad along the upper Arkansas and practically over the same mountain route on which he had encountered the hardships of that winter 1848-49. He returned from Europe to take charge of this work, and found a practicable line for a railway between the thirty-eighth and thirty-ninth parallels. The details of this undertaking are not of special interest as a part of this volume.

Under the same Congressional enactment authorizing and directing trans-continental railroad surveys to be made, from the Missouri to the Pacific ocean, another one between the thirty-eighth and thirty-ninth parallels was entrusted to Captain J. W. Gunnison, of the Topographical Engineers. Captain Gunnison began his work at the mouth of the Kansas river, proceeding westward to Bent's Fort, thence up the Arkansas to the Apishapa and Huerfano affluents, through the Sangre De Christo pass into the San Luis park, through the Saguache valley and Cochetopa pass, down the Gunnison river to its junction with the Grand, and thence westward across Utah to the valley of Sevier lake and river, where he, with several of his party, was murdered, October 26, 1853, by Pah Ute Indians. His survey rendered it obvious that the great depression about the forty-second parallel, traversed by the bulk of the California and Oregon emigration, afforded the better route for a railway.

In 1854, Colonel Steptoe, of the United States army, with three hundred troops passed through the southwestern part of what is now Colorado on his way from New Mexico to Salt Lake, and surveyed portions of the country. He made some efforts at road-building, and some overland mail was afterward carried over his route until the civil war compelled the adoption of the central route for its transmission.

After the founding of Denver the region of the Rocky Mountains was quickly over-run by the gold-hunters, and instead of official exploring expeditions, many official surveys, and scientific researches in detail soon followed. When the professional surveyor put in an appearance with his sections, towns, and ranges, the romance of the former days of exploring and adventure disappeared. Soon after him came the railroad builder; and the topographical engineer and his dependent, the locomotive, are exceedingly practical propositions.

In 1827 the United States government established Fort Leavenworth, an important frontier post, on the west bank of the Missouri river, twenty miles above the mouth of the Kansas river, near where the flourishing city of Leavenworth, Kansas, now stands. For many years Fort Leavenworth was the objective point of much of the plains travel and enterprises, as the city became of similar importance in later years when the rush to Denver was inaugurated. The Fort is still a military post.

In those early days the United States had neither military posts nor forces of any kind in this Colorado country, nor for long afterward. The fearless and adventurous traders, trappers and frontiersmen went ahead on their own account, built their own forts, and depended on themselves for protection from the Indians when the latter took a notion to be hostile, which happened often enough. The fur trade was pursued with such persistence and by so many that in a comparatively few years the valuable fur-bearing animals were almost exterminated. By 1840 the business had dwindled until it had lost most of its former great importance.

In the summer of 1852, the United States established Fort Massachusetts—the first Federal military post in what is now Colorado—on Ute creek at the western base of the Sangre De Christo mountains and in what is now Costilla county; that site having been chosen that raiding bands of Utes might more readily be intercepted. It was occupied until June 24, 1858, when it was dismantled and abandoned; Fort Garland, seven miles farther south, and near the confluence of Ute creek with Trinchera creek, having been built to serve the former purposes of Fort Massachusetts. After the Mexican war Fort Union, to the eastward from Santa Fe, was built and became a permanent military post of the United States. The American Fur Company's old Fort Laramie, far to the north, was bought by the United States in 1849, and troops were immediately stationed there. In the summer of 1858 a detachment of United States troops built in Cheyenne Pass in what is now southeastern Wyoming, a small military post which was called Fort Walbrach. It was of little importance to any one in the Pike's Peak country. To the east there were Forts Riley and Kearney, respectively in what are now eastern Kansas and Nebraska. This was the extent of the military protection in this region for hundreds of miles around the site of Denver, when our pioneers came to the mouth of Cherry creek in 1858.

CHAPTER XV.

Development of the Fur Trade—Early Traders and Trading Posts—Establishments Near the Site of Denver—Santa Fe Trail—Extinction of the Fur Trade—"The Lost Trappers," a Remarkable Story of Western Adventure—Noted Frontiers-Men and Traders—Improvidence of the Trappers—Death of Espinoza.

While it is true that white men, other than the Spaniards who came from the southward, reached the Rocky Mountain country in the region of Denver more than one hundred and sixty years ago, and that others approached it on several occasions within a few years, both before and after that time, it was not until the Nineteenth century was advanced to near its first quarter that occupation of the country, by more or less transitory pioneers, may be said to have begun.

Immediately after the United States acquired the Province of Louisiana, St. Louis became the center of a large trade in the west and southwest. Dealing in furs was the dominant portion of the business, and was the foundation of many large fortunes in that city. In 1805 the Missouri Fur Company was organized there, and in a few years its motley collection of French, American, and Canadian trappers, agents and couriers, two or three hundred in number, spread out over the western country, following the Missouri and its tributaries. Some of the old accounts state that employees of this company went as far as the Rocky mountains before 1810, but whether they came to the locality of Denver, is not known.

Three years after the organization of the Missouri Company, a branch of Astor's Northwest Fur Company was established at St. Louis, but its operations were upon the headwaters of the Missouri, and not in the direction of Denver.

The American Fur Company was another organization that began business about the same time that the Northwest Company did, and its traffic grew to enormous proportions. In later years it had its men in nearly all the territory drained by the Missouri river and its tributaries, including the North Platte and the South Platte country. Most of the trading posts ostensibly owned and operated by individuals, were practically agencies of these fur companies.

Following these enterprises, William H. Ashley, a prominent early citizen of St. Louis, engaged in the fur business in 1822 and continued in it several years. He sent out a force of about three hundred men, and most of his operations were in the Rocky Mountains country, chiefly in the region north of Colorado. It was with this company that "Jim" Bridger and William Sublette, two frontiersmen afterward noted in this region, came to the mountains. In later years, after Ashley's retirement, the business was carried on by the Rocky Mountain Fur Company under the direction of Sublette, and its transactions extended down this way and to the Arkansas river.

Beside Pursley and the few other traders who passed through here in earlier years, mention of whom we have already made, the survivors of a considerable party which first met disaster at the hands of the Indians on the headwaters of the Missouri, came southward past the site of Denver, in 1807. To these men and their adventures we will again briefly refer.

In the year 1812 Robert Stewart, who was identified with the fur trade on the Pacific coast, with two trapper companions named McLellan and Crook, made the long overland journey from the coast to St. Louis. When they were in the Utah basin they met a man named Joseph Miller who was going alone to the mouth of the Columbia river. Miller stated to them that before he entered the mountains from the great plains he encountered some Arapahoe Indians who stole his horses and everything else he had, but considerately spared his life. Stewart and his associates crossed the Rockies by way of the South Pass, but before they got over, a band of Crow Indians came up with them and treated them to the same experience Miller had received at the hands of the Arapahoes. Stewart and his companions escaped from the Crows without bodily harm, made their way down the Platte to the Missouri, and thence to St. Louis.

It was not until after 1820 that the trappers and traders entered what is now Colorado in any considerable numbers and with the view of remaining in the country with some degree of permanence. Aside from those to whom we have referred in a preceding chapter, some wandering Frenchmen and French half-breeds had strayed through this locality, but no definite trading posts or habitations were located until a few years after Long's expedition.

The first traders who established themselves in the region now within the limits of Colorado, were the Bent brothers, of St. Louis; and Ceran St. Vrain, a young French Canadian. There were six of the Bent brothers—John, Charles, William, Robert, George, and Silas, of French Canadian descent. They had been employed almost from boyhood by the American Fur Company, and until they entered the business for themselves. John and Silas were not engaged in it personally here in the west, but remained at St. Louis most of the time. The other four were conspicuous and active men in this part of the country for many years.

In 1826 the Bents and St. Vrain built a primitive trading post on the northward bank of the Arkansas river, about half-way between the present cities of Pueblo and Canon City. It was a rude kind of stockade made by setting heavy stakes or small logs upright in the ground, and within the structure were the business and living quarters.

In 1828 this place was abandoned, and its owners moved farther down the Arkansas valley where, at a point about twelve miles from the modern town of Las Animas, a new and more imposing station was built of adobe, and named Fort William, after William Bent. It was four years in building, and after completion became a busy place as the headquarters for a large territory roundabout. Ordinarily the baptismal name of the post was neglected, and it was commonly called "Bents' Fort." Here the owners carried on a large trade with the Mexicans, the Comanche, Cheyenne, Arapahoe, Pawnee, and Ute Indians, and the hunters and trappers of the region. Their operations made them men of note and of great influence.

Charles Bent.

This Fort William was a most pretentious establishment. Its dimensions were one hundred by one hundred and fifty feet, and its walls were about six feet thick at the base, and eighteen feet high. Some sixty persons were employed there, and in the busy seasons it was a place of great activity. In Farnham's "Travels in the Great Western Prairies" (1839), the following mention is made of some of the conditions at Fort William:

"In the months of June, August and September there are in the neighborhood of those traders from 15,000 to 20,000 savages, ready and panting for plunder and blood. If they engage in battling out old causes of contention among themselves, the Messrs. Bent feel comparatively safe in their solitary fortress. But if they spare each other's property and lives, there are great anxieties at Fort William; every hour of day and night is pregnant with danger."

In 1852, exasperated by the tedious, red-tape negotiations of the War Department which contemplated buying it, its owners blew up Fort William, completely wrecking it. William Bent then determined to erect another and still more important structure. The site selected was at the Big Timbers, on the Arkansas, about forty miles to the westward of the destroyed station. This was a favorite locality with the three mutually friendly tribes of plains Indians—the Arapahoes, Cheyennes and Kiowas—and they usually established their winter villages there because of the supply of wood and other necessities the place afforded. This new and historic structure was quite a military establishment. It was one hundred by one hundred and thirty-five feet, walls four feet thick and fifteen feet high, built of stone and adobe. On the northeast and southwest corners were bastions in each of which were placed two brass cannon, and the walls were pierced in proper places for musketry. It was finished and occupied in 1854, and used as a trading post until the autumn of 1859, when the government leased it, added barracks and officers' quarters, and named it Fort Wise, after the Governor of Virginia. In 1861 the name was changed to Fort Lyon, after General Nathaniel Lyon, who was killed at the battle of Wilson Creek, Missouri. In the spring of 1866 a freshet in the Arkansas flooded it, undermined its walls, and made it useless for military purposes. A new Fort Lyon was built by the government about nine miles east of the present town of Las Animas; and later, part of the old one was repaired and used as a stage station on the line between Kansas City and Santa Fe.

But the old business had long since vanished, the trappers and traders of the early, picturesque, and often perilous days, were nearly all gone, and the old life and old scenes had ended forever. Nothing is left of the two Forts William but some heaps and ridges, the remains of their once massive but now crumbled adobe walls.

Robert and George Bent died in 1841. Immediately after the United States took possession of New Mexico as one of the consequences of the war with Mexico, Charles was appointed its first American Governor. He perished in the massacre at Taos on January 19, 1847, which followed an uprising of the Pueblo Indians, who were instigated to revolt and led on by Mexican conspirators. William, who had married a Cheyenne squaw, had continued as a trader, and later became a government freighter. He survived, the last of the noted old firm, until May 19, 1869.

In 1830, a French trader named Maurice, all the way from Detroit, established a small trading post on Adobe creek in what is now Fremont county, and in a few years several Mexicans located near it and engaged in farming in a small way. There was some trouble with the Arapahoe Indians over a Ute squaw living at this post in 1838, and the Arapahoes went on the war-path to get her. Maurice, with French tact, held them off in parley, in the meantime sending a messenger to a strong party of Utes who were encamped over in the Wet Mountain valley. The Utes came whirling across to the post, fell on the Arapahoes, and after killing a lot of them, put the survivors to flight. The cause of the trouble remained at the post unharmed, and not afterward molested. Maurice maintained his little establishment there for several years.

At this time there were small numbers of Mexican settlers located on the Greenhorn and Huerfano rivers, in what are now Pueblo and Huerfano counties and the hunters and trappers for the fur-trading people frequented that section of the country. In 1840, St. Vrain, the Bents, Maxwell and others started a settlement on Adobe creek, in what is now Fremont county, intending it to be permanent, but it proved a failure, and was abandoned in 1846.

Another important early trading post to the southward of Denver was "the Pueblo," of which the flourishing modern city of that name is, in one sense, the successor. The exact date of the beginning of "the Pueblo" can not be stated with certainty. A collection of Mexicans, and traders and trappers appears to have been located there as early as 1840. The old Pueblo structure, itself, was claimed to have been built in 1842, by George Simpson, who will further figure in our story, and two other frontiersmen named Doyle and Barclay. James P. Beckwourth also claimed to have built it, in 1842, and is on record as having said while he sojourned in Denver in 1860:

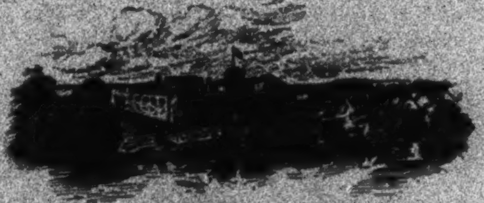
> "On the first of October, 1842, on the upper Arkansas, I erected a trading-post and opened a successful business. In a very short time I was joined by from fifteen to twenty free trappers, with their families. We all united our labor and constructed an adobe fort sixty yards square. By the following spring it had grown into quite a little settlement, and we gave it the name of Pueblo."

Beckwourth's reputation for telling the truth was very bad, and his statement is open to many doubts. In 1843 there were about a dozen American men located there, married to or living with Mexican or Indian women, and otherwise engaged in hunting, trapping and trading.

Ruxton, in his "Adventures in Mexico and the Rocky Mountains," and who was at "the Pueblo" in 1847, on his return from Mexico, describes the place and people as—

> "A small square fort of adobe with circular bastions at the corners, no part of the walls being more than eight feet high, and around the inside of the yard or corrall are built some half-dozen little rooms inhabited by as many Indian traders and mountain men. They live entirely upon game, and the greater part of the year without even bread, since but little maize is cultivated. As soon as their supply of meat is exhausted, they start to the mountains with two or three pack animals and bring them back in two or three days loaded with buffalo or venison. In the immediate vicinity of the fort game is very scarce, and the buffalo have within a few years deserted the neighboring prairies, but they are always found in the mountain valleys, particularly in one called Bayou Salado in the South Park, which abounds in every species of game, including elk, bears, deer, big horns or Rocky Mountain sheep, buffalo, antelope, etc."

"The Pueblo" would seem to have been a fated establishment, and with its other misfortunes, fell into great disrepute; and that meant a very bad state of affairs, for this then remote region was not a great stickler for conventionalities. Major Thomas Fitzpatrick, an old and experienced frontiersman, who was one of William H. Ashley's men in the fur trading enterprise of 1822, and who at this time was an Indian Agent, writing from Fort Bent in 1847, says of it:



Fort Bent.

> "About seventy-five miles above this place, and immediately on the Arkansas river, there is a small settlement, the principal part of which is composed of old trappers and hunters; the male part of it are mostly Americans, Missouri French, Canadians and Mexicans. They have a tolerable supply of cattle, horses, mules, etc., and I am informed that this year they have raised a good crop of wheat, corn, beans, pumpkins and other vegetables. They number about one hundred and fifty souls, and of this number, about sixty men, nearly all have wives and some have two. These wives are of various Indian tribes as follows, viz: Blackfeet, Assiniboines, Arickarees, Sioux, Arapahoes, Cheyennes, Snake, Simpitch (from west of the Great Lake), Chinook (from the mouth of the Columbia), Mexicans and Americans. The American women are Mormons, a party of Mormons having wintered there, and on their departure for California [?] left behind them two families. These people are living in two separate establishments, near each other, one called "Punble" and the other "Hardscrabble." Both villages are fortified by a wall twelve feet high, composed of adobe. These villages are becoming the resort of all idlers and loafers. They are also becoming depots for the smuggling of liquors from New Mexico into this country."

This writer was in error in locating the two villages "near each other." "Hardscrabble" was in what is now the southeastern part of Fremont county, at the mouth of the creek now bearing the same name, and about thirty miles west of "the Pueblo."

These old-time settlers at "the Pueblo" appear to have had a varied assortment of Indian wives, if Major Fitzpatrick were correct in his report, and the place would seem to have been one of a general bad odor. But a great misfortune later befell the people who were then its inmates. On Christmas day of 1854, there were seventeen trappers and mountain-men congregated there, celebrating, with the aid of a good supply of Mexican whiskey, that holiday. Of course they soon were drunk on "Taos lightning," and while in that condition a band of Ute Indians came along. The Utes were invited to join in the celebration, and joyfully accepted the hospitable invitation of their tipsy hosts. The "Taos lightning" affected the Indians as it did the whites, and soon all hands were "fighting drunk." In the free fight between white and red, which at once ensued, every white man was killed. A teamster who had left the place in the morning, came back in the evening and discovered the dead bodies of his former comrades. A Mexican girl and two children were carried off, and were afterward rescued by some trappers and Mexicans.

The particulars of the affair were subsequently learned from some of the Utes who were engaged in it. For several years after this tragedy a report that "the Pueblo" was haunted by the spirits of the victims of the affray, was current among whites and Indians, and both races avoided the place. The old structure was not again occupied, and fast went to ruin. Hardscrabble had disappeared several years before, and with such a name and fame as it had, it was well that it did so.

It was not until 1832 that a trading establishment was located up here on the South Platte in Denver's vicinity. In that year Louis Vasquez, a French-Canadian, built one of cottonwood logs, opposite the mouth of Clear creek, which, at that time, was given the name of Vasquez Fork. By way of the Platte Vasquez's post was about six miles from the mouth of Cherry creek, and its site is near the present northern limits of the city. Beckwourth, already mentioned in connection with "the Pueblo," was a nephew of Vasquez, and was employed at the post which remained there many years. Later in his life Beckwourth became a conspicuous character in and around Denver in the pioneer days, though he did not long flourish in the town. Some further account of him appears in the next chapter.

Soon after Vasquez established his post at the mouth of Clear creek, Peter A. Sarpey erected another on the Platte river, about five miles farther down-stream. Sarpey was a French trader from St. Louis, who spent most of his life among the Indians and accumulated a considerable fortune. His post was not so important as that of Vasquez's. He was an irascible man, but got along much better with the red men than he did with the white ones.

Following Sarpey's establishment, "Fort Lancaster," another trading post, was built on the right bank of the Platte, about ten miles farther north, and was maintained a few years. Then, as the tradition has it—for there is no definite record—"Fort Lupton," farther north and just within the southern part of what is now Weld county, succeeded Lancaster; its name still attaching to the place. It is of tradition that these posts were built by a trader named Lancaster Lupton, who divided his name between them; but of this we found no certain record. Both were comparatively temporary and unimportant, and exact dates of the beginning and end of their careers are lacking.

In 1838 the Bent brothers and Colonel Ceran St. Vrain built the famous old station, Fort St. Vrain, on the eastward side of the Platte nearly a mile below (north) of the mouth of St. Vrain creek, and about forty miles north of the site of Denver. In most historical accounts its location is erroneously given as having been at the mouth of the Cache-a-la-Poudre. The historic old structure was maintained as long as the fur business and Indian trade afforded profit to its owners. It was built principally of adobe, but little or nothing of it now remains. The Cache-a-la-Poudre tributary of the Platte received its name from the circumstance of a party of French trappers "caching," or concealing by burial, in the bank of the stream, a quantity of powder in the early days.

St. Vrain was French Canadian, a large, powerful man, who was a frontier trader nearly all his life. He was a prominent figure in southwestern affairs in pioneer times, and was much of a leader of men. He came up from New Mexico to build his station on the South Platte, and for many years operated between it and the country down that way, being associated with the Bents in many other enterprises. After the exhaustion of the fur business he returned to New Mexico, where he died at his home in Mora, in October, 1870.

In 1842 a weekly express was established between Fort St. Vrain and Fort Bent, the route being along the South Platte, then by way of Cherry creek southward. R. L. Wooton, who later became a pioneer in Denver, was a courier on this express line for several years. At the same time, a line was maintained from Fort Bent to Taos, and these enterprises were really the originals of the pony express business in the Rocky Mountain country.

Thus it will be seen that for nearly twenty years, prior to Fremont's first expedition, this country around Denver had been tramped over by many white men. Each of these trading posts was the resort of hunters, trappers and peripatetic traders who roamed the plains and mountains, and in the aggregate probably constituted a regiment or two.

Ceran St. Vrain

In the winter of 1858-59, Captain (afterward General) R. B. Marcy, of the United States army, while crossing the mountains with a detachment of troops on the way from Fort Bridger, Utah, to Taos, New Mexico, came across the remains of one of these early trading posts, in the distant recesses of the Rockies. He says:

> "On the 8th of December we struck Grand River near the confluence of its two principal branches, the Uncompadre and the Bunkara. We forded them, but with much difficulty, as the water was deep and rapid, and filled with floating ice, and encamped at the base of 'Elk Mountain,' near the remains of an old Indian trading establishment which had formerly been occupied by a man named Robedeau, of St. Louis, who wandered out into this remote wilderness many years ago, but was subsequently driven away and his buildings burned by the Indians."

So, even in so remote a region as that, a trading post had existed "many years ago." Roubideau, the man to whom General Marcy referred, was one of the early comers to the Colorado mountain country.

Choteau, who came out in 1817, and got into entanglement with the Spanish authorities of New Mexico, as we have mentioned in a preceding chapter, later established a trading station on the island in the Arkansas river, which still bears his name. It was the center of much activity in fur-trading times.

During those years the old Santa Fe Trail became a great highway of travel and commerce between the Missouri and New Mexico. As an established route for travel it dates from 1822. Pack animals were used at first, but in 1824 wagons were brought into service, and from that time until the railways supplanted it, it was continuously traveled by wagon trains, stage coaches, and mounted companies of people.

The traffic over the Santa Fe trail in the beginning started from the old and forgotten town of Franklin, Missouri, on the Missouri river, about one hundred and sixty miles west of St. Louis, to and from which city the way was by steamboat navigation. In a few years later the old town of Independence near Kansas City, and a few miles back from the river, became the headquarters for the trade.

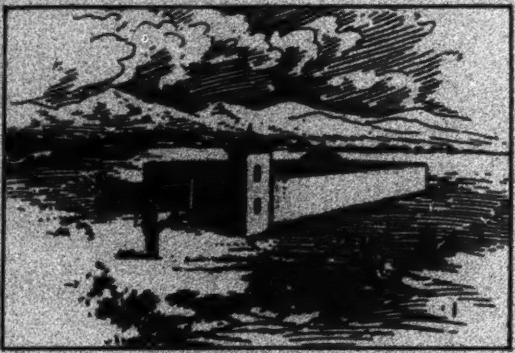
Before Denver was founded there was some of this plains caravan travel, bound for Utah, which came up this way and went to its destination, by way of Bridger Pass, across the mountains.

Referring to the halt of his command at the mouth of Cherry creek, during the first week of May, 1858, Captain Marcy says:

> "There was at that time but one white man living within one hundred and fifty miles of the place, and he was an Indian trader named 'Jack' Audeby, upon the Arkansas."

Although this statement would seem to be inaccurate, as there were still some of the old hunters and trappers in the country who were "living" hereabout so far as such rovers could live anywhere, it shows how near complete extinction the old fur business of the region had been reduced. The "Audeby" mentioned by Marcy was one of two noted trapper brothers of French extraction, named Autobees.

On a preceding page of this chapter we mentioned some men who made their way through this part of the country in 1807. They were the survivors of a party, the experiences of which so well present the dangers and hardships of life here in the early years of the Nineteenth Century, and reflect so much of the character of the pioneers of this region, the chances they were willing to take, and the risks they would assume, that some account of the adventures of these men, thoroughly characteristic of those which later befell hundreds of others, is fitting here. The narrative is condensed from a little book, "The Lost Trappers," published in 1847.



Fort St. Vrain.

When Lewis and Clarke returned from their expedition to the mouth of the Columbia river they took with them to St. Louis, as guests, a small party of Mandan Indians including one of their chieftains, with the understanding that they would be safely returned to their homes after their visit.

In 1807 these Indians left St. Louis on their return, escorted by a company of twenty white men under Captain Ezekiel Williams. Williams and his men intended engaging in trapping and expected to make their way across the continent to the mouth of the Columbia river. It was the first private intentional overland enterprise to the Pacific, north of the Spanish country, anyway.

The mixed assemblage reached the Mandan villages without noteworthy incident and after a brief stay there Williams and his men started off up the Yellowstone river. They stopped at a place where beaver and game were plenty, and ten of the party went out to kill some buffalo. A band of Blackfeet Indians got after these men and killed five, the other five escaping to camp. The remaining fifteen now put off in haste to the southward until they fell in with the Crows, who happened to treat them so well that one of their number, named Rose, who had turned out to be an outlaw of a fellow, decided to remain with his dusky hosts.

Now, Williams had fourteen men left, including himself, and they made way toward the South Pass. When they reached the vicinity of the North Platte they encountered another party of Crows, who, less hospitable than their brethren, killed another five of Williams' men, but lost about twenty of their own number in doing it. The Williams party had started from the Mandan country on horses but these Crows captured all the horses, and Williams with his eight survivors hastened away on foot, after caching their furs and other belongings they could not carry. Winter was now upon them, and they had to get through it the best way they could.

In the spring of 1808 they found themselves on the South Platte, close to the mountains and probably somewhere near where Denver now stands. As they proceeded southward one after another was cut off by the Indians until but three were left—Williams, the leader, and James Workman and Samuel Spencer. These survivors determined to get back to St. Louis if they could, and from Pike's Peak started across the plains. But, after all their troubles, in the face of the gravest peril, they soon quarreled and divided. Williams found his way to the Arkansas, which he thought was the Red river, and by voyaging down it by night in an improvised boat, reached the friendly Kansas Indians who directed him to Fort Cooper, on the Missouri, whence he safely reached St. Louis.

Workman and Spencer also went to the Arkansas, and they, likewise, mistook it for the Red river. Following it up stream they found the trail of Lieutenant Pike's expedition of the previous year. Pike, or some one of his party, had taken the Arkansas for the Red and had, as we have told, cut the name of the latter in the rocks near by, which confirmed the error of the two wanderers. Hoping to find the river's headwaters in a range which, once crossed, would put them near Santa Fe, they followed on up stream until they were again in sight of Pike's Peak, which they afterwards said seemed so high "that a cloud could not pass between its top and the sky." They boldly entered the mountains and for weeks were trying to find the sources of the Rio Grande, but finally came upon those of the Colorado, which they followed in the hope that it would lead them to Santa Fe; being the first Americans to float on the waters of that stream.

They went on down the river until they came to a trail, which they decided to follow. After two days on the trail they encountered a Spanish caravan going to Los Angeles, California, which they joined and proceeded with it to its destination. It returned the following year and Workman and Spencer came with it to Santa Fe where they remained as successful traders fifteen years.

They were probably the first Americans to cross the Continental Divide south of Lewis and Clarke's pass. Williams, nothing daunted by his extraordinary experience, in 1809 organized another party for the mountains, came out, and recovered the furs and other property he and his first party had cached two years before.

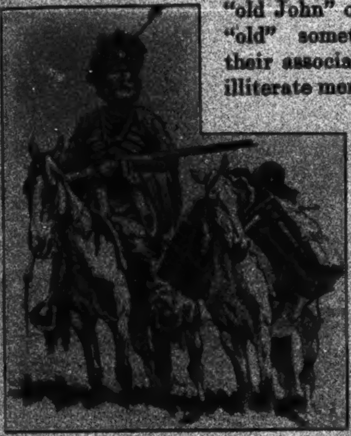
Among the more prominent frontiersmen—hunters, trappers, scouts, guides, and Indian fighters in this region during the early occupation period, and for many years thereafter, were Carson, Bridger, Wooton, Baker, Williams, John Smith, Claymore, Poisel, Beckwourth, Wiggins, Pfeiffer, Pattie, Nugent and the Autobeas brothers, Charles and Thomas. All these men were noted figures from the Black Hills to the Rio Grande.

St. Vrain, the Bents, Chambonard, Sarpey, Vasquez, Chouteau and Roubideau were traders rather than Indian-fighting frontiersmen, although their business required them to be both upon many occasions.

The men whom we have mentioned here are only a few of those who figure in the early annals of the Far West, but they were the more conspicuous pioneers in this part of the country. Of the aggregate numbers of such men, there is now no basis for even an approximation. They dropped out one by one in the vicissitudes of their life, and when the fur business was worn out, and the Indian fighting later came to an end, they were well along toward extinction, too. In the first half of the century there were many of them; the party with which Pattie came to the Colorado mountains in 1824 numbered one hundred and twenty men, and thereafter, other companies of varying sizes crossed the plains and scattered over the region of fur-bearing animals.

Many of the trappers were either directly employed by the fur companies, or were working under contracts with them which made them something like peons. Obtaining all their supplies from the companies, their reckless improvidence kept them continually in debt to the corporations and in such relation toward them in consequence thereof, that they were hardly to be considered as free men. Others, who operated independently, on their own account, selling their peltries wherever they chose and buying their supplies in the same way, were known as "free trappers."

Most of these mountain men as they advanced in years came to be called "old John" or "old Jim," or "old" something else, by their associates. They were illiterate men, rough in their manners and habits, reckless and improvident, and with a few exceptions, they died in poverty. Their occupation in the early days was a very profitable one, beaver skins alone bringing them from six to eight dollars a pound. But it was not unusual for them to squander in a few days at a trading post the proceeds of an entire season's peril, hardships and labor.



Trapper Ready for Business.

But they were devoted to each other in these periods of hardship and times of peril. The rude but rigid ethics of their class demanded of every man that he should share his store with an unfortunate on the plains or in the mountains, and that he should imperil his own life in the defense or rescue of a beleagured or endangered fellow-being not an enemy. It would be difficult to find records of many violations of this unwritten law.

By some queer process the name of the Autobees brothers became twisted around to "Tobin," and they were finally commonly known as Charley and Tom Tobin. It was Tom Tobin who at a later time shot the younger and worse of the two notorious Mexican bandits "the Espinozas," who were long the terrors of the region around the headwaters of the Arkansas and Rio Grande rivers. One of them was killed by a party of avengers, but the younger escaped at that time. This one had murdered twenty-three men, and a bounty of one thousand dollars was offered for his head. Tom Tobin hunted him down, killed him and cut off his head as evidence of right to the reward, which Tobin afterward claimed was never paid in full. He was in Denver in January, 1884, and the Denver Times of the 23d of that month, after referring to his visit, says:

> "Regarding the relics of the Espinoza affair, he said he had seen since he came to Denver the knife which he took out of the bandit's belt after he shot him. But as for the knife with which he cut off the robber's head that could not be found. He has commissioned State Treasurer Fred Walsen to find the knife in question and also the skull of the bandit which he asserts positively is still in the 'State House.'"

It may be worth while to state that Espinoza's skull is still in Denver, but it is not in the Capitol. Tobin, the bandit's slayer, who is now eighty-eight years old and the last of his intrepid class in Colorado, lives in an adobe house about four miles southwest of the town of Fort Garland, in Costilla county.

CHAPTER XVI.

HUNTERS, TRAPPERS, AND TRADERS—"KIT" CARSON—"DICK" WOOTON—"JIM" BRIDGER—"JIM" BAKER—"BILL" WILLIAMS—JOHN S. SMITH—AUGUSTE CLAYMORE—JAMES P. BECKWOURTH—AVERSION TO CIVILIZED CONDITIONS—CHARACTER AND HABITS—METHODS OF TRADERS—EQUIPMENT OF TRAPPERS—REMARKABLE RECUPERATIVE POWERS.

First and foremost among all the rude but heroic figures in the Rocky Mountain pioneer history, was Christopher—"Kit"—Carson, the hero of countless juvenile stories of adventure, and the ideal hunter and Indian fighter, of unnumbered boyish imaginations. He well-deserved the lofty position accorded him in the youthful fancies of every American now browsing through the middle ages of his life. He stood at the head of a long line of celebrated frontiersmen, Indian slayers, trappers, scouts, and guides, and distinguished himself in every capacity in which he served.

Carson was born in Madison county, Kentucky, on December 24, 1809. His father removed to Missouri when Kit was a small boy, and settled in Howard county. In 1826, when about seventeen years of age, Kit, already an expert with the rifle, joined a west-bound caravan which passed near his father's home, and entered upon his remarkable career of adventure on the great plains and in the Rocky Mountains. For eight years he was the hunter for Bent's Fort on the Arkansas, keeping it supplied with buffalo beef; after which he followed the occupation of trapper, trader, woolgrower, scout, and guide, all of which incidentally involved conflict with predatory Indians. Later he became an officer in the Union army.

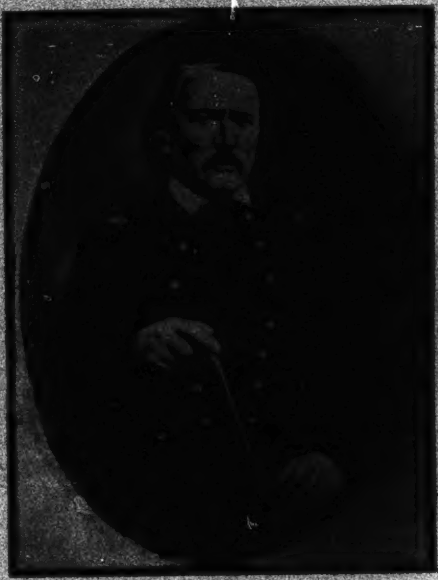
We shall not undertake to recount here his many adventures. This volume would no more than contain the briefest outlines of them if every page were devoted to only their more conspicuous incidents. The story of his life is a history of the exploration and of much of the development of all this region.

The service which first brought him prominently before the country was that which he rendered General Fremont as a guide to two of the exploring expeditions of the government under that officer. This gave him fame second only to that of his commander, and thereafter he was a conspicuous figure in the annals of the frontier, and in many important civic and military undertakings. While with Fremont the second time, he held a commission as Lieutenant in the United States army. Upon the outbreak of the civil war he warmly espoused the Union cause, rising to the rank of Brigadier General, and rendering valuable and highly important services in the southwest, which was then much isolated, and practically left to take care of itself. He also served as Indian Agent from 1854 to 1859, the Utes having been under his particular charge, and he won additional renown as having been one of the comparatively few men in such positions who were strictly and unswervingly honest in all their dealings with the government and the Indians, between which they stood.

Carson was a man of fine natural abilities, but of little education. He read with difficulty, and beyond signing his name, was unable to do much writing. His accounts and reports betray the handiwork of several penmen more skillful in such craft than the noted frontiersman. He fluently spoke the somewhat erratic English used on the frontier in his times, and with it, French, Spanish, and several Indian tongues, all acquired orally. Notwithstanding his defective education, he was quick, shrewd and accurate in his business transactions. Personally he was the incarnation of fearlessness, though of singularly retiring, modest manners. He participated in scores of rescues, defenses, and other bloody encounters with the Indians, in which he was always the leader in counsel and in fighting. His almost reckless bravery, his indifference to the gravest peril, and his many remarkable escapes from what appeared to be impending death, led his associates to believe he bore what they called a charmed life; an opinion in which many of the Indian tribes also joined. Ruxton's "Life in the West," published fifty years ago, thus refers to Carson:

"Kit Carson, paragon of mountaineers! small in stature, and slenderly limbed, but with muscles of wire, with a fair complexion, and quiet, intelligent features. To look at Kit none would suppose that the mild looking being before him was an incarnate devil in the Indian fight, and had raised more hair [scalped] from the heads of red-skins than any two men in the western country; and yet thirty winters had scarcely planted a line or furrow on his clean-shaven face. No name, however, was better known in the mountains, from Yellow Stone to Spanish Peaks, from Missouri to Columbia river; than that of Kit Carson, 'raised' in Boonlick county of Missouri state, and a credit to the diggins that gave him birth."

Before the civil war, the old conditions of far western life having even then almost wholly passed away, Carson established his home at Taos, New Mexico. His wife was a comely Mexican woman of many accomplishments, and by her he had several children. In 1867 he had established his home at Boggsville, near Las Animas, in Bent county, this State, his health having become impaired by the strain and hardships of his remarkable career. In the winter of 1867-68 he went to Washington in charge of a delegation of Ute Indians. His health broke down while thus engaged, and upon his return he lay ill here in Denver several days at the Planters' House which then stood at the corner of Sixteenth and Blake streets. He rallied sufficiently to be taken to his home, where he continued to improve. But soon afterward while at Fort Lyon on business connected with his long service as an officer in the army, (which had terminated at the close of 1867) he suddenly became fatally ill, and died at the Fort on May 24, 1868. His death was ascribed to a complication of physical disorders among which was an affection of the heart. The death of his wife a short time before had greatly depressed him. Both were buried at Boggsville, but subsequently their remains were taken to Taos where an appropriate monument now marks their resting place. In the Plaza at Santa Fe his name appears among others on a cenotaph raised to commemorate the services of the Union soldiers of that Territory. Of one of the circumstances associated with his death, Senator Casimero Barela, of Trinidad, wrote us:



Kit Carson. (From a civil-war-time portrait.)

"Kit Carson's death was hastened, it was generally believed at the time, by grief over the death of his wife, Doña Chepita Jaramillo of Carson; one month after the death of his wife he died."

Of others of these intrepid men, we can further refer to only a few, who were in some degree identified with this locality. One of these, well known in his time all along the front range of the Colorado mountains, was Richens L. Wooton, or "Uncle Dick," as he was more familiarly called. He was a man far above the average frontiersman, was fairly educated, and of some ability and force of character. As one of the pioneer business men of Denver, we will have occasion to frequently allude to him hereafter. He was born in Mecklenburg county, Virginia, in May, 1816, his father later removing to Kentucky, whence young Wooton made his way to the west at the time he was about twenty years old. He reached Independence, Missouri, in 1836, where he found a wagon train of Bents' and St. Vrain's about to start across the plains. Joining it he entered upon a long and adventurous career as a hunter, trapper, trader, merchant and ranchman, his wanderings making him familiar with New Mexico, Colorado, Wyoming, and much of the region beyond the Rocky Mountains.

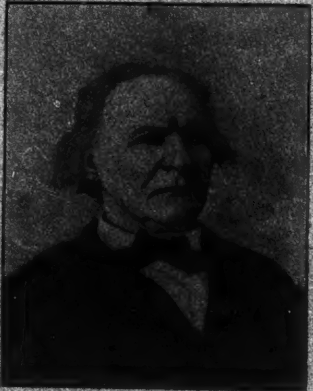
He was a contemporary of Carson, and a comrade of that noted pioneer in many encounters with the hostile Indians. Contrary to the usual manifestations of Indian character, the Arapahoes were always his friends, and upon several occasions refuge with them saved him from the scalping for which his red enemies had made careful and overwhelming preparations. An Arapahoe squaw who had been made a prisoner by the Utes, escaped and attempted to make her way over the mountains to her own people. She had almost perished from cold and exposure when Wooton encountered her. He provided her with food and accompanied her to her people who, in consequence of his humanity, became his firm and lasting friends. From the scar of a bad knife-wound on one of his hands he was known among the Indians as "Cut-Hand."

After more than twenty years of hunting, trapping, trading, and fighting with the Indians, he came to Denver in December, 1858, with one of the pioneer stocks of merchandise brought to the settlement that year. He established himself in what was then Auraria, and became a citizen of considerable importance in the young community. In 1862 he discontinued his business here and engaged in ranching at "the Pueblo," the city of Pueblo now including his ranche land within its limits. Here he unsuccessfully attempted to breed and rear buffalo, a venture which he had long held to be practical as a business enterprise. Disposing of his Pueblo ranche he acquired another near Trinidad where he spent the remainder of his life, which ended August 21, 1893.

In many of his earlier trading enterprises he was an associate of the Bents and St. Vrain, and unlike the majority of the frontiersmen, was prudent in caring for his earnings and profits, with the result that he acquired and retained a competency.

He was one of the bravest of men, and his unflinching courage was proved in many desperate encounters with the Indians. As a volunteer leader in suppressing the Indian uprising at Taos, in 1847, he was one of the most conspicuous of the daring men who prevented further massacre of Americans in New Mexico.

In 1890 Wooton's recollections of his long and adventurous career, edited by Howard Louis Conard, were published in a most entertaining volume, in which life on the frontier is depicted in a manner that commands the reader's interest.



"Uncle Dick" Wooton.
(Photographed 1889.)

James Bridger, "Old Jim Bridger," was a compeer and comrade of Kit Carson, and as a mountain man one of the leaders of his kind. Learning and traversing the plains and mountains was the business of his life. He was born in Washington, D. C., in 1807, and came to this part of the country when a mere boy with Ashley's company of trappers. He spent his whole life as a frontiersman, and an account of his adventures would make another large volume. He discovered the way through the mountains, known as Bridger's Pass, and later established in that region a trading post which, still later, was occupied by General Albert Sidney Johnson's army during the "Mormon War," and became Fort Bridger now in southwestern Wyoming. Later in his life he acted as guide for the engineers making preliminary surveys for a railroad to the Pacific. He served the government for years as a scout and is said to have been the first American white man who saw the Great Salt Lake. He was frequently in Denver in the pioneer times. It is related of him that he decided on the route for the Union Pacific railroad across the mountains in a few minutes, disposing of a problem that had bothered the engineers for a whole season. The circumstances are mentioned by Inman as follows:

"At one time early in the 60's, while the engineers of the proposed Union Pacific railway were temporarily in Denver, then an insignificant mushroom hamlet, they became somewhat confused as to the most practicable point in the range over which to run their line. After debating the question, they determined, upon a suggestion of some of the old settlers, to send for Jim Bridger, who was then visiting in St. Louis. A pass, via the overland stage, was enclosed in a letter to him, and he was urged to start to Denver at once, though nothing of the business for which his presence was required was told him in the text."

"In about two weeks the old man arrived, and the next morning, after he had rested, asked why he had been sent for from such a distance."

"The engineers then began to explain their dilemma. The old mountaineer waited patiently until they had finished, when, with a look of disgust on his withered countenance, he demanded a large sheet of paper, remarking at the same time,—"

" 'I could a told you fellers all that in St. Louis, and saved you the expense of bringing me out here.' "

"He was handed a sheet of manilla paper, used for drawing the details of bridge plans. The veteran pathfinder spread it on the ground before him, took a dead coal from the ashes of the fire, drew a rough outline map, and pointing to a certain peak just visible on the serrated horizon, said,—"

" 'There's where you fellers can cross with your road, and nowhere else, without more diggin' an' cuttin' than you think of.' "

"That crude map has been preserved, I am told, in the archives of the great corporation, and its line crosses the main spurs of the Rocky Mountains just where Bridger said it could with the least work."

To make sure of a refuge in his old age, Bridger in 1857 purchased a farm near Westport (Kansas City), Missouri, to which he withdrew about 1870 after his long and adventurous career on the plains and in the mountains, and on which he died and was buried in 1881.

James Baker, another "Old Jim," was a contemporary of these men in the old mountaineering days. He was, also, familiar to many Denver people of the present time, for he was frequently here through the closing years of his adventurous life which ended in 1898. He was a native of Illinois and came to the mountain country when he was eighteen years old, entering the service of the American Fur Company. From that time his career was that of hunter, trapper, trader, scout, guide and Indian fighter, until between the advance of civilization and the infirmities of hardships and age, he and his occupation fell into disuse together.

Baker had as many adventures, as many hairbreadth escapes, as many thrilling encounters with wild men and wild beasts, as any of his calling. His earnings as a trapper and guide amounted to a fortune; but, like most of the others, he was liberal to a fault, dissipated at times, and recklessly improvident. He would throw away a season's proceeds in the carousal of a day or two. At one time, after a profitable period of trapping and trading, he had nine thousand dollars in cash.

He announced his determination to abandon his rough life, return to his birth-place, buy a farm and settle down for the remainder of his days. Accordingly he started out to bid his friends good-bye in the customary fashion of his kind, got to drinking, and then into a gambling den, and within twenty-four hours every dollar of his little fortune was gone. His return to his birth-place was a dream that never came true.

Next to Kit Carson, Baker was General Fremont's most trusted scout and guide, and served him faithfully in most of his exploring expeditions through the Rocky Mountains. He was in the service of the government in many other undertakings, and was noted for his trustworthiness in everything he was appointed to do. In common with all his class, and notwithstanding his weaknesses, which were also common to his type when in contact with the crude elements of civilization the region early afforded, he was as true as steel to the duties of his calling and to his associates. Devoid of fear, devoid of selfishness, he would not for an instant hesitate to risk his life to defend or save that of a companion; and he did so time and time again.

"Jim" Baker.
(Photographed 1890.)

Early in his frontier career, following the custom of the trappers and traders, Baker married an Indian squaw. She was of the Shoshones and he lived among her people a long time, cultivating many of their habits, customs and superstitions. Nevertheless, he had an ill opinion of Indians as a people. He is quoted as having said to General Marcy:

> "They ar' the most onsartainist varmints in all creation, an' I reckon thar not more'n half human; for you never seed a human, arter you'd fed and treated him to the best fixin's in your lodge, jes turn 'round and steal all your horses, or any other thing he could lay his hands on. No, not adzactly. He would feel kind o' grateful, and ask you to spread a blanket in his lodge, ef you ever come his way. But the Injun don't care shucks for you and is ready to do you a lot of mischief as soon as he quits your feed."

Notwithstanding his rough exterior, his rough life, and his frequently rougher manners, Baker was a most generous, noble-hearted man; an excellent example of a brave, hardy, extinct type of men who performed inestimable services for their contemporary fellow-beings. He was almost the last of his day and generation, having survived until May 17, 1898, when death, to which he had so often been near, finally laid its hand upon him. He died at his ranche on Little Snake river, in Routt county, northwestern Colorado, in his eighty-eighth year. After Denver was founded he built a cabin, which he long occupied, on Clear creek, beyond the present Jesuit College, where the road to Boulder crosses that stream, the bridge there still being known as "Baker's bridge." It was a toll-bridge in the "Sixties," and an enterprise of Baker's.

William Williams, commonly known in the later years of his career, as "old Bill" Williams, was a famous mountain man—scout, trapper, hunter, and fighter. He knew all the passes and every part of the mountains thoroughly. He was a guide for Fremont in his expedition of disaster and, had the old man's advice been followed, the explorer would probably have kept out of a trap he fell into and which then cost the lives of eleven men and the loss of much valuable property; and, indirectly, eventually of six more, including that of Williams, himself. The "Pathfinder" finally, as we have stated, got out of the impassable and storm-swept region into which he had plunged, and made his way, after much suffering and hardship, to Taos. After Fremont left Taos for California by a more southerly route, five of his men who had declined to accompany him, concluded to see if they could not recover some of the previously lost property; Williams accompanying them. They went to the mountains where disaster had befallen Fremont and were attacked by Ute Indians in ambush. All were killed except Williams who made his escape from the trap. He was followed by the Indians, who did not recognize him, and killed while cooking some food over a camp-fire. He had been a friend of the Utes and well-known by many of them. When they discovered who it was they had killed, they were grief-stricken. Old Shavanau, a Ute chief to whom Williams had previously given a fine Hawkins rifle was one of the attacking party. The Indians placed Williams' body in a sitting position against a tree and Shavanau stood the gift-rifle at his side in token of penitence; and so they left him. The body was afterward found in that position with the rifle at its side by a party of white men who buried the old man under the tree there in the mountain fastnesses.

John S. Smith, "Uncle John" as his frontier acquaintances later called him, was a famous character all along the Rocky Mountain ranges in the early times. He came to the far west in 1826, leaving his home in St. Louis when a boy, in the American Fur Company's service, and falling in with the Indians soon after he reached the plains. He finally attached himself to the Cheyenne tribe which roamed around here, married one of their squaws and became a chief of great authority among them. He subsequently abandoned his Indian chieftainship, and was a trader, trapper and guide.

During his chieftainship with the Cheyennes he was almost an autocrat in this region, and many of the traders paid him tribute for the privilege of doing business undisturbed by his braves. After his return to white associations he became a quiet, inoffensive old man. He was noted for his remarkable resemblance to President Andrew Johnson. Of the conspicuous part he bore in the founding of Denver we will later give a full account.

Auguste Claymore was another of the old-time scouts and trappers well-known at Denver and all over this region. In one of his many adventures with the Indians, his skull was so badly broken by clubs that portions of his brain exuded. His companions who came up and drove off the Indians before Claymore was scalped, made preparations for his burial, an event which seemed but an hour or two distant. To their astonishment Claymore revived, and in a few weeks recovered. He lived to see the country populated, and towns and cities built where once he placed his beaver-traps, and watched the hostile red man.

We have heretofore mentioned James P. Beckwourth. He was a familiar figure in and around Denver in its beginning and along until the early Sixties. His career was a strange one even for one of the class to which, by turns, he belonged. Probably no man ever met with more personal adventures, even among the mountaineers and trappers who early faced the perils of this region. He was at times a trader and trapper; at other times a chieftain among the Crow Indians, one of the most troublesome of the plains tribes.

He was born in Virginia of a slave mother, his father having been the Irish overseer of his native plantation. Following his mother's condition Beckwourth was a slave during his boyhood, but as soon as he was old enough to do so he ran off and made his way to St. Louis, and from there to the west with a party of trappers, finally reaching New Mexico. There he fell in with Vasquez, and with that trader came as an employe to Vasquez's post here on the South Platte, near the site of Denver. Subsequently he left his white associates and joined the Crows among whom he speedily became a leader, and engaged in many of their predatory enterprises. Growing tired of this occupation, he left them and became guide and interpreter for some of the government expeditions, which occupation took him to California. While there he fell afoul of a vigilance committee and left precipitately for Missouri. Early in 1859 he came to Denver with the tide of immigration, and built a cabin up the Platte at the "Mexican," or "Spanish," "diggings." Early in 1860 he married the daughter of a colored woman who was the first laundress, of her race, in the pioneer towns. Beckwourth then engaged in merchandising on the west side of Cherry creek, and remained here several years.

Richardson, who saw Beckwourth here in the summer of 1860, thus refers to him:

> "Here is a well-formed elderly man, with a devil-may-care expression, but a face full of character and of wonderful perceptive faculties; long black hair, complexion like a Mexican, and eyes like an Indian. It is James P. Beckwourth the half-breed, so long a chief among the Crow tribe, and the most famous Indian fighter of this generation. His body is scarred with wounds received
> 'In worst extremes, and on the perilous edge
> Of battle, when it raged.'
> But he is the very pink of courtesy, and specially devoted to a comely young wife whom he invariably dignifies with the title of 'Lady Beckwourth.'"

But "Lady Beckwourth" did not permanently remain in favor. Beckwourth finally left her and civilization, and returned to a roving life on the plains. His end was a somewhat extraordinary one. About 1867, he made a visit to his old friends and associates, the Crow Indians, in what is now Wyoming, intending it to be a farewell to them, as he had decided to resume civilized life. The Indians insisted that he remain with them, but when they learned he would not, they prepared a feast for him on the eve of his contemplated departure. They poisoned his food and he died in a few hours from the effects. In explanation of this gross breach of even Indian hospitality, the Crows afterward stated that Beckwourth had always been "good medicine" to their tribe, and that they were determined that if he would not stay with them alive, they would secure his body and keep it among them.

Beckwourth was an uncommon type of man, even for the far west during the first half of the Nineteenth Century. Parkman gave considerable attention to him, and also an evil reputation, as the following attests:

> "He is a ruffian of the worst class; bloody and treacherous, without honor or honesty. Such, at least, is the character he bears on the great plains. Yet in his case the standard rules of character fail; for though he will stab a man in his slumber, he will also do the most desperate and daring acts."

His contemporaries, Carson, the Bents, and others spoke differently of him, and still other accounts say that while he was ready for any desperate undertaking, and had many life and death encounters with other frontiersmen, he was honest and straightforward, and noted for the uprightness of his dealings with the Indians.

We are obliged to limit ourselves to the foregoing brief outline of this singular and noted frontier character, who was familiarly known either personally or by his fame, all over the plains and along the Rocky Mountains. Whatever sort of man he may have been—and he certainly was not what we would consider a good man—he appears to have had sound views on one question, at least. He is represented to have said while sojourning in Denver:

"The traffic in whiskey for Indian property was one of the most infernal practices ever entered into by man. Let the most casual thinker sit down and figure up the profits on a forty-gallon cask of alcohol, and he will be thunder-struck, or rather whiskey-struck. When it was to be disposed of, four gallons of water were added to each gallon of alcohol. In two hundred gallons there are sixteen hundred pints, for each one of which the trader got a buffalo-robe worth five dollars. The Indian woman toiled many long weeks to dress those sixteen hundred robes. The white traders got them for worse than nothing, for the poor Indian mother hid herself and her children until the effect of the poison passed away from the husband and father, who loved them when he had no whiskey, and abused and killed them when he had. Six thousand dollars for sixty gallons of alcohol! Is it a wonder with such profits that men got rich who were engaged in the fur trade? Or was it a miracle that the buffalo were gradually exterminated?—killed with so little remorse that the hides, among the Indians themselves were known by the appellation of 'A pint of whiskey.'"

While these frontiersmen knew they were instrumental in preparing the way for civilization, with its towns and cities, and knew that it would follow their footsteps, they were not comfortable amid the scenes and surroundings brought with it. The feelings of "Uncle Dick" Wooton were characteristic of his class, and serve well as an example to record here. In his book he thus mentions some of his reasons for leaving Denver, which was not at that time a very great city:

"I left Denver in 1862. Looking at it from a business standpoint, I can see now that this was a mistake. If I had remained there and grown up with the capital city, I might have become a rich man, and had a big hotel or an opera house, or something of that sort named after me. I reckon I shouldn't have felt right, though, after the buildings got too thick. There would have been a lack of room and breathing space, and I might have been expected to wear fine clothes. Anyhow I should have been jostled about on the streets instead of having the road all to myself, as I do now when I go out for a walk, and should have had the noise and dust of the city, instead of the singing of the birds, and the pure air of the mountains, that I have here."

During Bridger's first visit back to St. Louis, then a comparatively small city, an acquaintance saw him sitting on a box in one of the narrow streets, seeming disgusted with his situation. To the inquiry as to what he was doing there all alone, he replied:

"I've been settin' in this infernal canyon ever sence mornin', waitin' for some one to come along and invite me to take a drink. Hundreds of fellers has passed both ways, but none of 'em has opened his head. I never seen sech an onsociable crowd!"

It can not be truthfully said that many of such men were of saintly character, or that they led lives above reproach. With their good qualities many vices kept company, and with a result presenting most singular incongruities in the individuals. At the trading posts most of them would get drunk and carouse for days at a stretch, squandering their earnings, and then going forth, penniless and often in debt, to another season's work. Frequently upon these occasions they would fight among themselves; and encounters between such men especially when inflamed with liquor, were no mere bar-room brawls, ending in a bloody nose for one and a bruised shin for the other. Yet, either combatant, if both survived, would risk his life to save that of the other, when subsequently on the plains or in the mountains.

"Jim" Bridger.
(Photographed about 1870.)

Nearly all of them had Indian wives, or squaws whom they called their wives. Formal ceremonies, other than some deference to the flimsy customs of the Indians, were waived, and the union was always subject to the probability of the roving husband going away some day and forgetting to return to his dusky spouse. As a rule the male offspring of these marriages turned out badly, and many of the most diabolical wretches that ever cursed the frontier were the fruit of such unions. A half-breed son of Governor Charles Bent, though sent to St. Louis and educated, became the crafty leader of one of the most murderous and fiendish bands of Indians on the plains, which was not broken up until its merciless captain was systematically hunted down and shot as the most ferocious wild beast would have been.

To the uninitiated there would seem to be almost insurmountable difficulties in the way of white men, who knew nothing, or next to nothing, of Indian language, carrying on trade with the red people. An old trader thus told how the business was usually conducted:

"They knew nothing about money, and when they occasionally got hold of a silver dollar they used it to make some kind of an ornament. They knew, however, that a pony was worth more than a buckskin, and that a rifle was more valuable than a butcher knife. The trader always fixed the prices and the first thing to do was to arrange the schedule, if such a term can be used in connection with anything so primitive in style as Indian trading. I got together a parcel of sticks, each representing one of the articles I had to dispose of. The Indian laid down a buffalo robe, for instance, and then I commenced laying down the sticks, representing different things, that he wanted to trade for. When I put down sticks enough to represent, in my line of goods, what I thought was the value of the robe, I waited to see if the Indian was satisfied. As a rule, he wasn't. I don't know whether or not the Indian has descended from the Jew, but I know he has some of the same instincts in trade. He would insist on having sticks representing other articles added to the pile, and sometimes it would take a good while to reach an agreement. When the agreement was reached, however, it fixed the price on buffalo robes, and as fast as they were transferred to my side of the lodge in which the trading was carried on, I dealt out the articles traded for. In the same manner the prices were fixed on all the other Indian commodities, and we got through with our business very rapidly. In this way I have traded to the amount of a thousand dollars or two in a half-day, after we once got started."

Of the life of the trappers and mountain men generally, Kit Carson, while living at Taos in 1859, said:

"Our ordinary fare consisted of fresh beaver and buffalo-meat, without any salt, bread or vegetables. Once or twice a year, when supplies arrived from the States, we had flour and coffee for one or two meals, though they cost one dollar a pint. During the winter, visiting our traps twice a day, we were often compelled to break the ice, and wade in the water up to our waists. Notwithstanding these hardships, sickness was absolutely unknown among us. I lived ten years in the mountains, with from one to three hundred trappers, and I cannot remember that a single one of them died from disease."

The pure air of the plains and mountains gives to the human system remarkable power of resistance to wounds and disease. An authenticated example of this is the case of Mark Ralfe, a young Frenchman attached to Bent's Fort in the early days. Ralfe was overtaken on the Arkansas river by a band of hostile Kiowas who fell upon him, shooting him in three places and stabbing him in four. Believing him to be dead, as he certainly ought to have been, they scalped him with a dull knife, leaving no hair whatever except a little lock above each ear. After the Indians left, Ralfe recovered consciousness, revived sufficiently to regain his feet, and then with no nourishment except water, walked to the fort some forty miles distant. In a few months he was well again, and he lived many years after.

A young man—a mere boy, really—named Robert McGee, was captured by the Indians down on the Arkansas river in southeastern Colorado. The savages concluded to kill their captive. The chief struck him down with a blow from a tomahawk and then shot him, others drove three or four arrows deep into the back of the prostrate body, still others slashed the victim with knives, and then he was scalped and left for dead. He was afterward discovered by white men and, notwithstanding his frightful injuries, recovered, and through the years of his long life on the frontier took bloody revenge upon the people who had so cruelly mutilated him.

Baptiste Brown while fleeing on horse-back from pursuing Blackfeet Indians, in the mountains, attempted to make his animal leap a deep cleft or narrow gorge that confronted him. The poor beast failed to reach the other side, and horse and rider fell to the bottom. The horse was killed and Brown sustained compound fractures of both legs. When the Indians came up and peered into the gorge, Brown simulated death. The savages saw no way of getting down to scalp him, so they departed, leaving him with apparently poor prospects for living, or getting out of the chasm if he did. Fearing to discharge his rifle as a signal to his companions who were in the vicinity, lest the report might be heard by his red foes, he lay there twenty-four hours in agony. Finally he concluded to take his chances, and his rifle shots guided his associates to the cleft in which he lay. They got him out and set his broken limbs as best they could, for there was not a surgeon within five hundred miles. Brown got well, and physically was little the worse for his injuries.

Accounts of such examples of endurance, and recovery from apparently fatal injuries, might be added in numbers sufficient to cover many of these pages. Gun-shot and knife wounds, and other injuries regarded by these men as trifling, healed quickly and usually caused them little inconvenience. Their powers of endurance and recovery were remarkable. Most of the wounds and mutilations they survived, and seemingly without permanent disability would, in our own times and modes of life, be considered necessarily fatal, and in the majority of cases would be.

The history of no other country in the world affords any parallel to the American frontiersman; the rough, daring, fearless hero, who blazed the way westward from the Atlantic ocean, for the steadily advancing civilization that was more than two hundred years in reaching the Rocky Mountains. Nowhere in the world were such primeval conditions encountered as those which existed in this country; and nowhere in this country were adverse circumstances met and overcome by braver, more determined men, than these pioneers of the great plains and mountains of Colorado. When our State shall properly commemorate, in monuments and in statues, the deeds of men who laid the foundations and outlined the superstructure of our great commonwealth, the work will be poorly done if it makes not conspicuous the sturdy figure of the frontiersman, clad in buckskin garments, and leaning on the old, long-barrelled, deadly rifle.

CHAPTER XVII.

"Great American Desert"—Early Exaggerations and Misconceptions—Awful Tales of Travelers—Effect of Reports of Long's Expedition—Webster's Views—Public Opinion of Pacific Railroad Surveys—Persistence of the Delusions—Greeley's Impressions—Slow Death of the "Desert" Fiction—Lingering Misconceptions of the Western Country—Meteorological—Present Aspects of the "Desert" Region.

Few misbeliefs ever exceeded in their persistency and, we may say, in the enormity of their error, the one that for so many years attached to the great domain lying west of the Missouri river. Throughout the eastern portion of the United States, say east of the Mississippi, there was until a comparatively recent period, a deep-seated conviction, originally based on official but mistaken reports, that here in the west lay one of the two great desert regions of the world. Africa's Sahara was the other, and opinions were divided as to which presented horrors that entitled it to precedence. Each was believed to have distinctly frightful features peculiar to itself, but which were the more appalling was not determined, because nobody was willing to give up his life in trying to find out all about this one; and that such a sacrifice would be involved in such an undertaking, only a few people, who were pityingly held to be irresponsible, any way, had the boldness to doubt, after reading the many distorted versions of Long's accounts.

When the report of Long's expedition obtained general circulation through what there then was of the United States, it became fashionable to attribute every horrid aspect supposed to belong to great deserts, to the really unknown western country. That report was the foundation of all the mass of misconceptions, some of them of the most grotesque character, that a half century of years hardly served to dispel from the public mind. Incited to competitive efforts by Long's report, and possibly to win renown for having braved such dangers and come out alive, many of the early travelers into the west exhausted their vocabularies of shiver-producing adjectives in describing—or, as they frequently said, "in attempting to describe," the desolate, barren land of horrors constituting the "Great American Desert." Ensuing editions of school geographies took up the thrilling stories, incorporating them in text and pictures and maps, to the disturbance of many a youthful dream of the present population's older members.

This waterless, storm-swept land of sand; this howling, hopeless, worthless, cactus-ridden area, infested by savages of the most dreadful fierceness and cruelty, and haunted by prowling beasts of unexampled ferocity, ended in a mountain region of equal extent, where the peaks tore all the clouds to tatters, where snow that fell before Columbus landed still lay under all that had fallen since; where the naked granite sides of the mountains went straight aloft until lost to view; where shrieking gales forever blew over the frozen desolation that reigned supreme; and as they drove along wailed out the warning to rash mankind: "Abandon all hope, ye who enter here."

It is not strange that boys, especially bad ones, who read or heard these stories, failed of restful slumber in their attic beds when the wind and storm and snow were asweep through the winter nights.

This view had not always prevailed. In the first years of the century the great west was absolutely unknown to the English-speaking people of the United States. After the Louisiana Territory was acquired, the expeditions of Lewis and Clarke through the northwest, and that of Pike to this region, set out to see what sort of country it was. Their reports, while they were tinged with exaggerative color, perhaps natural to men visiting a new and so remarkable an empire, were neither distorted nor discouraging. But they were made at a time when news traveled very slowly, and means of disseminating information among the people exceedingly deficient. Only a very small proportion of the people ever learned the details of Lewis and Clarke's and of Pike's reports. Of those who did, many were disposed to take a hopeful view of the new territory and of its possibilities.

In 1807, there was published in Philadelphia by Mathew Cary a volume containing a most interesting account in diary form, of Lewis and Clarke's journeyings. It was written by one Patrick Gass, "one of the persons employed in the expedition." The publisher, in his preface, along with other things, said:

> "For if we take a view of the different discoveries and settlements previously made, we will find that those tracts through which the Missouri and Columbia rivers, and their branches flow, common-

> ly called unknown regions, were the only parts remaining unexplored, which could be considered valuable. * * * It will not be forgotten that an immense sum of treasure have been expended in the purchase of this country, and that it is now considered as belonging to the United States. Here, at no distant period settlements may be formed; and in a much shorter term than has elapsed since the first were made in America, from which hath arisen a great, powerful and independent nation, the posterity of the present inhabitants of the Union may unfurl the standard of independence on the plains of the Missouri and Columbia."

By the time the report of Long's expedition was made and published, circumstances and conditions had greatly changed. The animosities and strife engendered by the protracted struggle over the admission of Missouri as a slave State, were followed by a feeling of aversion toward the new domain in the west, that was rather general throughout the "north" of that day. If the new region were to be cut up into new slave States, anti-slavery men were ready and willing to believe anything and everything about it that was bad. At this juncture the Long report began circulating among the people, the newspapers quoted from it and commented on it, and everybody talked about it, with not a few saying "I told you so!" Long practically settled the character of the country in the minds of the people of his day and generation. He started the desert stories, and others revised them to suit their exaggerated fancies or ulterior purposes, and in a few years no fact of National interest was more firmly established in the minds of the people than that the greater portion of President Jefferson's purchase was probably the most extraordinary combination of mountain and plain desert anywhere in the world.

In 1838 an appropriation bill for the Post Office Department contained an item providing for a mail route from Independence, Missouri, to the mouth of the Columbia river. This was a wild, impossible proposition for those days. When the bill came before the United States Senate, Daniel Webster thought the recklessness involved in such use of public money called for his vehement disapproval. He made it the subject of a speech on the floor of the Senate, closing his remarks with these words:

> "What do we want with this vast, worthless area? This region of savages and wild beasts, of deserts, shifting sands and whirlwinds of dust, of cactus and prairie dogs? To what use could we ever hope to put these great deserts, or those endless mountain ranges, impregnable and covered to their very base with eternal snow? What can we ever hope to do with the western coast, a coast of three thousand miles, rock-bound, cheerless, uninviting, and not a harbor on it! What use have we for such a country? Mr. President, I will never vote one cent from the public treasury to place the Pacific coast one inch nearer to Boston than it now is."

In this tirade Mr. Webster did no more than voice the common beliefs of his time. He, along with the overwhelming majority, accepted the statements growing out of Long's well-organized, well-equipped scientific expedition, as literal, unqualified, all-embracing facts. They said the western plains were vast stretches of rocky, sandy surfaces, unwatered and worthless, and affording sustenance for but little vegetation except cactus and its allied plants. The mountains were practically impassable, excepting that they might be clambered over by hardy men during a few weeks in midsummer. In winter the entire country in and out of the mountains, was swept by fierce, devastating storms in the rigors of which the preservation of human life would be a grave problem, even to those who had made special preparation for the ordeal. Mr. Webster in his speech said little about this Colorado portion of the west that was not warranted and sustained by the then current versions of the report of Long's expedition.

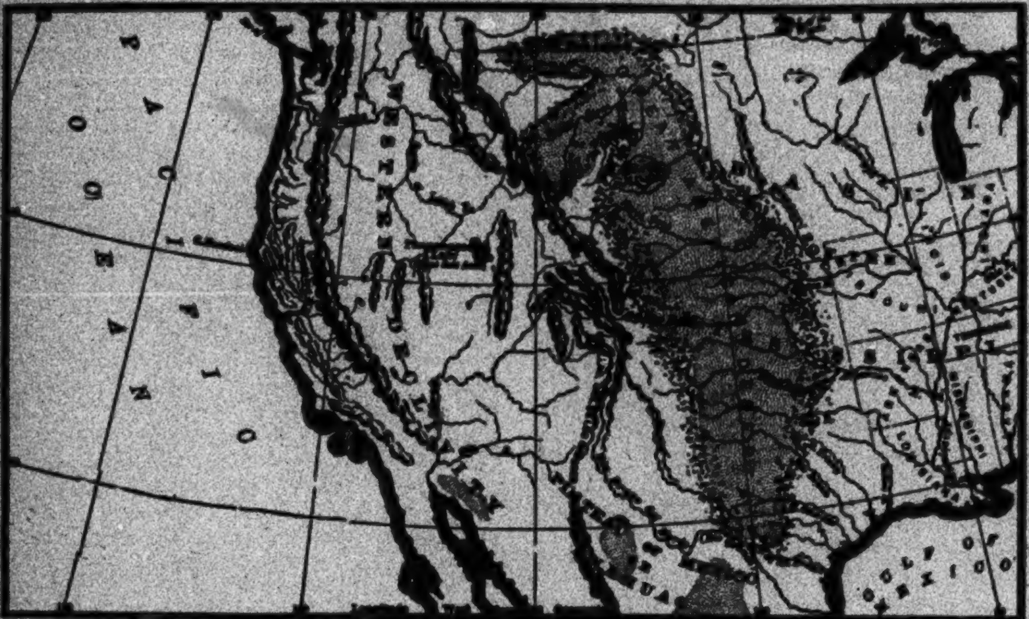
When Fremont's first expedition was organized and dispatched to the west in 1842, it was commonly looked upon as an undertaking beset by many dangers. Before that time, however, the western region had been invaded by the fur companies, and the lower Missouri had a considerable number of settlements along both banks. Modified descriptions of the country in the west were coming into circulation, and some people were revising their earlier conceptions; though insisting that while the whole of it might not be desert, most of it was and of a very bad kind. Nevertheless, the great majority adhered to the old opinions. The several expeditions under Fremont through the supposed utterly inhospitable country, made him a popular hero, around whom a halo of romance and perilous adventures was visible to the public fancy as long as he lived.

It was to this peculiar and pleasant position in the popular esteem, to which he had been elevated by his western enterprises, more than to any other single element of popularity or fitness, that he owed his subsequent nomination as candidate for President of the United States. It should be remembered, however, that the reports of Fremont's expeditions did much toward dispelling the prevailing false impressions of his time, of the character and resources of the Far West, as the country was then called.

Still, the public mind was slow in changing its beliefs, and hard to convince that most of them were founded on error. The spirit of exaggeration that had so long dealt with western affairs, and so nearly monopolized all the accounts and reports, had sown the seeds of a weedy growth that was harder to uproot than any thistle crop ever seen on the western plains. When the public surveys for a railroad across to the Pacific were first authorized and directed to be made, by Congress, thousands of honest, well-meaning people concluded that the Nation's legislation had passed under the control of imbeciles, and so began to despair of the Republic. The expenditure of public funds for a purpose so preposterous as that of even finding out whether a railroad could be built through such a country, to say nothing of the absurdity of building one, was considered by many citizens a piece of reckless, extravagant tomfoolery too outrageous to put up with. Had not Senator Webster shown the supreme folly of spending one cent of the public's money to bring the Pacific coast one inch nearer Boston than it was! Alas! We have fallen upon evil days when the affairs, even the fate of the Nation, are confided to the care of such vacuous minds as those now in control at Washington. So reasoned, with rising wrath, hosts of really sincere, patriotic voters in the east.

Even when the tide of emigration set out to the "Pike's Peak gold region," hundreds of the multitude believed that a long, waterless, nearly barren, dangerous stretch of country lay before them. As they proceeded along the way they were in daily anticipation of reaching before nightfall the region that the school-book pictures of their youthful days would make as familiar to them as the faces of their oldest friends. While the journey was tiresome, trying, and attended by hardships for many, and disastrous to some, the desert devotees could hardly believe their eyes when they saw the whitened peaks of the great mountains shining in the distant horizon, before they had yet traversed the stony, lonely, sandy, cactus-grown waste they had been taught to believe was one of the imperishable institutions of their country.

They had crossed the desert without knowing it or seeing it; the rolling plains swarmed with wild animals flourishing on the herbage there; their own cattle had subsisted on the wayside grasses through the length of their journey; they had not personally suffered anything much more serious than they would have endured in a similar trip—if there were room enough to make it—across the prairies of Illinois or Iowa, nor had they encountered any grave peril; and here they were, this soft, balmy June day, at the base of the mountains in a region of surpassing grandeur, beauty and fertility. Yet, when they started, in common with the friends they left behind them, many of this host believed they had entered upon an undertaking about as dangerous, as uncertain in its outcome, as we of these days are taught to regard an expedition to the North Pole, and requiring quite as much fortitude and determination.



Old Map showing "Great American Desert."

No eastern visitor to this part of the west in Denver's early days, rendered greater service to this immediate section of the country, than Mr. Horace Greeley, the justly-famous editor of the New York Tribune, who came to Denver in the summer of 1859. To many incidents of his visit we will give attention in a succeeding chapter of this volume, pausing here to say that he grasped with greater clearness and firmness, the mineral and other natural resources of Colorado, than were exhibited by any of his passing contemporaries. With respect to the gold discoveries, then just assuringly made, he gave in letters to his great newspaper, unbiased, unembellished, truthful information that was of inestimable benefit to the young settlements, and which should have served to disillusionize the excited, enthusiastic, thoughtless multitude which, with a hurrah, came streaming into the new country. But this really belongs to another part of our story.

Mr. Greeley had not, however, entirely freed his mind of the ancient yarns concerning the desert-like character of the west. His impressions of some districts were perceptibly influenced by the still lingering, common old prejudices which, with the discomforts of the long journey that were increased by a painful accident, combined to induce some conclusions reversed by him in later years. In his letter from Denver, dated June 15th, he dwelt at length on climatic and other conditions hereabouts, as he had observed them and had been told about them. His guileless, confiding character is well shown by some of the statements he transmitted to the readers of his great newspaper as facts. We quote a pair of examples:

> "High winds are of frequent, all but daily occurrence here, within a dozen miles of the great protecting bulwark of the Rocky Mountains; while, from a point fifty miles eastward from this, they sweep over the Plains almost constantly, and at times with resistless fury. A driver stated on our way up, with every appearance of sincerity, that he had known instances of tires being blown off from wagon-wheels by the tornadoes of the Plains; and, hard to swallow as that may seem, I have other and reliable assurance that, when the Missourians' camp, on the express-road, was swept by a hurricane, five or six weeks ago, so that, after the wreck, but three decent wagons could be patched up out of their six, as I have already narrated, one of the wheel-tires was found not only blown off but nearly straightened out!"

In a previous letter written June 2d, while on the stage journey to Denver from the east, Mr. Greeley thus gave his impressions of the country through which he was then passing:

> "For more than a hundred miles back, the soil has been steadily degenerating, until here where we strike the Republican, which has been far to the north of us since we left Ft. Riley, three hundred miles back, we seem to have reached the acme of barrenness and desolation. We left this morning, Station 17, on a little creek entitled Gouler, at least thirty miles back, and did not see a tree and but one bunch of low shrubs in a dry water-course throughout our dreary morning ride, till we came in sight of the Republican, which had a little—a very little—scrubby cotton-wood nested in and along its bluffs just here; but there is none beside for miles, save a little lurking in a ravine which makes down to the river from the north. Of grass there is a little of miserable quality—either a scanty furze or coarse alkaline sort of rush, less fit for food than for physic. Soil there is none but an inch or so of intermittent grass-root tangle, based on what usually seems to be a thin structure of clay, often washed off so as to leave nothing but a slightly argillaceous sand. Along the larger water-courses—this one especially—this sand seems to be as pure as Sahara can boast."

While considerable areas of that country still remain waterless in summer, the soil of nearly all of it possesses great inherent fertility, and none of it is at any season comparable with what has been told of the Sahara. It is true that emigrants crossing in midsummer by new and untried deviations from the established routes, for a few days suffered great hardships from the scarcity of water, but that district was not then nor is it now the dreary waste of endless sand the earlier writers were so fond of describing it to be.

At the time Mr. Greeley was making this account of that so-called desolate, foodless region, he was also commenting, with many expressions of wonder, upon the countless numbers of buffalo and antelope which were grazing, flourishing and growing fat on his Sahara land. He states that in one day's journeying he believed that he saw one million buffalo between sunrise and sunset. But he makes no attempt at reconciling his description of the country with the presence of such a host of huge animals sustaining themselves upon its vegetation. Mr. Greeley was then nearing Denver and almost within sight of a section of his Sahara which, with irrigation in later years, has been made a vast garden of greenery and bloom. The region through which he made his journey is now traversed by many railroads, and the traveler gliding along at high speed in a luxurious railway car, sees no such landscapes as those presented to the weary, dust-laden, creeping pilgrims of 1859.

Many readers of Mr. Greeley's letters, and they were read by many thousands, interpreted these accounts as applying to the whole central plains region, and there was in consequence, a revival of the waning confidence in the "Great American Desert." A considerable number of eastern folks decided that much of the old stories was true, after all was said and done. The great civil war came on, the thoughts and energies of the people on both sides were absorbed in the mighty struggle, and deserts, whether or no, were subjects of little importance in the presence of that tremendous conflict.

It is not difficult to see how even the travelers of the stage coach days were impressed by the long monotonous journey over the plains, and were led to conclusions that the country had little or no agricultural value. The mode of travel was trying and wearisome, cramped in a none too roomy vehicle day and night, with little chance for restful sleep; the comparative slowness of progress, with its dust and grime through the heat of a cloudless summer day; the radical difference between the plains country and that left behind to the eastward of the great rivers, and the apparently unwatered character of large sections; all these, with the well-known disposition of travelers to magnify the aspects of new, and to them, strange scenes, and the novel incidents of an unusual journey, tended toward judgments and convictions that would not be held under different circumstances. The occupants of the wheeled palaces that roll along on the rails of the many railroads westward of the Missouri, receive impressions of the country as different from those acquired in the pioneer times, as day is from night; and the railroads marked the end of the pioneer times.

In the spring and early summer the plains were in the main beautiful in the far-spreading greenery of the young grass and herbage, and brightened by myriads of wild flowers of many hues. Occasionally, though, there were stretches less inviting, in which there was no soil worthy the name and where from the tiresome, poverty-stricken sandy ground, the cactus, Spanish nettles, the prickly pear and kindred growths, of amazing persistence, flourished surprisingly in their uninviting surroundings, and with an abundance that seemed quite unnecessary. The prairie verdure matured early, and by midsummer over the long reaches of country, it was turned to brown and gray by the heat of the summer sun. But the hosts of buffalo and antelope fed and kept fat on this great store of naturally-cured hay standing where it had grown. Over considerable areas of the Colorado plains, the appearance of the country through the seasons remains, of course, practically unchanged. In winter it is necessarily bleak, as treeless, nearly flat landscapes are everywhere when the snow is driving and the winds are cold.

Of the mountain region the pioneers early learned that its character, while indescribable in the magnificent grandeur and beauty of its aspects, had been as grossly misrepresented as were the great plains spreading eastward from its base for so many miles. The mountains did not present a forbidding, impassable barrier to westward progress and occupation; they were not covered to their bases with a winding sheet of eternal snow; they did not constitute a vast, impenetrable region, towering in shattered masses of barren rocks to and above the clouds, where the unbroken, despotic rule of the Ice King forbade the presence of any living creature. Aside from the mineral treasures buried in their depths, the mountains were soon learned, furthermore, to be the glory of the country, and that nestled between the great chains were fertile valleys and parks of exquisite loveliness, with a fruitfulness of exceeding bounty.

Mr. Greeley appreciated their mighty magnificence, and their boundless value to mankind; and in evidence of this we quote from one of his letters written from Denver in June, 1859:

"And the Rocky Mountains, with their grand, aromatic forests, their grassy glades, their frequent springs, and dancing streams of the brightest, sweetest water, their pure, elastic atmosphere, and their unequalled game and fish, are destined to be a favorite resort and home of civilized man. I never visited a region where physical life could be more surely prolonged or fully enjoyed."

The desert fiction had a slow death, if its lingering end may even yet be said to have come. There are people where the rainfall flows into the Atlantic who still cherish this delusion of their youth and prefer not to have it disturbed.

Through the "Sixties" many known and unknown writing men came to the Pike's Peak region. The impressions of some of them survive in sundry books and in compilations of newspaper letters into book form, constituting in the main a collection of more or less valuable and interesting views and conclusions. Several of these writers—all of them had to get here by stage-coach over a large portion of their route—saw, or thought they saw, the old desert as they came out. One of these gentlemen was Colonel A. K. McClure, who later became more prominent as the owner and editor of the Philadelphia Times newspaper. He came to Denver in the spring of 1867 on a visit to the Rocky Mountains country. At that time the Union Pacific railroad was finished to North Platte, and the flood of immigration was pouring into Kansas, Nebraska and Dakota, and settling on the rich homestead lands to be had of the government for the asking.

Early Representation of a Prairie Fire on the "Great American Desert." (From an old print.)

Colonel McClure came by way of Omaha to North Platte by rail, whence he proceeded to Denver by stage. Like many of his journalistic predecessors, he wrote letters to various eastern newspapers while on his travels. These, in 1869, were published in book-form under the title, "Three Thousand Miles in the Rocky Mountains." In his letter from North Platte, dated May 8th, he thus described the country through which he had passed after leaving Omaha:

"After passing through Nebraska for a few miles, the evidence of progress is not marked. There are but few settlers on the line of the road, and after we enter what is called the Platte plains, about Fort Kearney, there seems to be little that can ever invite the husbandman. The valley, or

> vast plain, is bounded on every side by great bluffs, ranging from twenty or thirty miles apart, and the bluffs seem to be terribly sterile and repulsive. * * * * The valley is a miserable waste and I fear ever must be. * * * There is not a habitation on the route for nearly two hundred miles but such as are necessary to accommodate the railroad and the travel. Here and there are miserable adobe shanties, with signs out, offering whiskey and other luxuries to the weary sojourner."

Nearly all this region that contained "little to invite the husbandman," and which this writer feared must ever remain a "miserable waste," is now one vast cornfield of wonderful fertility, dotted over by thousands of well-kept homes. Colonel McClure came on to Denver from North Platte by stage, and under date of May 11th, recorded his further impressions of the country through which he had passed, as follows:

> "About Fort Kearney and thence westward there is but one continued plain, parched, whitened with alkali, without shrubbery or trees, almost entirely without small streams, and altogether inhospitable, bleak and desolate. * * * * The river Platte rolls its turbid waters through the Platte Valley, and makes no sign of life along its borders. It is wide, shallow, muddy, broken by innumerable islands, treacherous and apparently useless. It does not even skirt its own banks with shrubs or timber. Along its banks is the same weary waste that the plains present for miles on either side of it."

In a letter written at Denver a few days later, Colonel McClure said:

> "The "ranch" is the home of the western settler. Whether of the farmer, station-keeper, or retailer of the scant necessaries which command a sale to the emigrants and travelers, are called ranches. For six hundred miles east—from Denver to the Missouri river—there are scarcely any buildings but sod hovels, a single low story in height, and covered with sod or prairie grass. In these miserable holes they live, without a shrub or tree to shield them from the bleak storms of winter or the scorching suns of summer. Around them are no signs of vegetable life but what is presented by the vast prairie that reaches from bluff to bluff, north and south and east and west, until the vision is lost in the hazy distance. Not a plant is cultivated; not a single growth is known that affords sustenance for man. If they should plow and sow, they would be denied their harvest time. The dry summers, usually without rain from May until fall, parch everything that is green, and only the tough grasses of the prairie preserve a sickly shriveled life. These settlers produce nothing. They brave the perils of the scalping knife for a time, to gather enough money to enable them to remove east or still farther west and get a fruitful home. None of them, except those at important points like Julesburg, dream of spending a lifetime where they are."

It is hard to understand how or why an intelligent observer could or would, so late as 1867, describe such a country in terms so utterly misleading as these. "For six hundred miles east—from Denver to the Missouri river" there was nothing to inspire hope for the future! There was no promise for any growth that would afford sustenance for man! "If they should plow and sow they would be denied their harvest time!" This, of a country in which more than a million of men are now plowing and sowing without being denied their harvest time!

The ranchers built their low and often picturesque dwellings of the heavy root-matted sod, with walls two feet through, and roofs thatched with grass and thinner sods. Such houses may still occasionally be seen, and possess the comfortable qualities of coolness in summer and the cosiest warmth in winter. They are not, nor were they ever, the squalid abodes of a shiftless, spiritless peasantry. The comfort-giving homes of energetic, forceful men, they grew out of the conditions of their environment, and were good examples of adapting available means to necessary, immediate needs. Often they were surrounded by a corrall, or enclosure of sod built up in thick walls of the heavy turf, which gave them, if not the conventional aspect of a fort, much of the security afforded by a military structure, and afforded shelter and protection to the cattle of the owner, and of the wayfarer within his gates. Most of these habitations were long since superseded by more pretentious structures, those remaining being found chiefly in the remotest sections of the country.

There was a manifest disposition by the early visitors to this plains country to exaggerate nearly everything. A familiar but unimportant example of this exceedingly human tendency, was the usual description of prairie fires, which were said to be common, every-day events. These conflagrations were represented as great billows of flame rolling over the landscape, driving before them thousands of terror-stricken animals, striving in frantic desperation to escape the besom of destruction so fiercely pursuing them. The old school-book pictures made awful catastrophes of these events; and a favorite juvenile belief of the writer's vanished when he reluctantly learned that they were delusions. In one coveted geography that belonged to a comrade who went to another school, one of the "desert pictures" showed smoke masses rising above billows of flame and rolling up into the sky where the clouds should have been; but as to the phenomenon of so much fuel growing on such a desert, nothing was said. In the fast diminishing foreground were thousands of fleeing beasts—buffalo, beautiful wild horses, deer, antelope, wolves scared into unwolfly association with better creatures, and all the rest of the animal population of the plains. In the midst of this racing horde a pioneer was belaboring his galloping horses with a mighty whip, while his wife was trying to keep on her knees behind him in the wagon while she besecched heaven to assist in their salvation. The fate of that devoted couple remained for years a fascinating problem for youthful contemplation.

In some localities, such as broad river-bottoms, where the exceedingly rank growth of vegetation afforded large quantities of tinder-like fuel, such fires were very dangerous, and when swept forward by a driving gale were usually fatal to all living creatures encompassed by them. But, generally speaking, they were not so on the plains, proper. There, as a rule, the wild animals had no great difficulty in keeping ahead, or getting out of the way, of the prairie fires. The most interesting features they presented were the spectacular effects produced at night, which were sometimes impressive to the beholder, and suggestive of great danger; but in daylight they lost most of their threatening aspects.

A ready method of avoiding danger, and the one usually adopted by menaced people on the plains, was to start another fire where they were. The wind would soon drive this second blaze away from the starting point and in the same direction the other was advancing. In a few minutes this intentionally burned-over area would be quite large enough to afford security from the original fire, and with no greater inconvenience that the temporary one caused by its smoke.

The Indians who remained at large in the country until recent years, declared that the white men brought rain with them, and that the dry season was becoming shorter and favored with more frequent showers. Some of the old citizens of the State believe that the occupation and improvement of the country by the new population has been followed by a definite, though not large, increase in the rainfall over the eastern part of Colorado in which lies whatever there is of an arid district in the State.

The following tabulated statement of meteorological statistics covering the entire period of twenty-nine years during which the United States Weather Bureau has maintained a station in Colorado, was prepared for this History of Denver, by Mr. F. H. Brandenburg, local forecast official at Denver, and director of the Colorado section of the climate and crop service of the United States Weather Bureau of the Department of Agriculture. It is, we believe, the first time such a record covering the entire period has been presented in this compact and comprehensive form, and it is of much value and interest. It does not, unfortunately, sustain the beliefs of the Indians and old settlers that the amount of annual rainfall is increasing with the settlement and development of the country by the white people:

Dividing the period of the first twenty-eight years covered by this table into four lesser periods of seven years each, it will be seen that the average annual rainfall in the first minor period was 15.94 inches; in the second, 14.03 inches; in the third, 13.94 inches; and in the fourth, ending with the close of 1899, 12.74 inches. The greatest amount in any one of these twenty-eight years, was in 1891, when there were 21.43 inches; the least was in 1893, when there were but 8.48 inches. In 1900 it was rather above the average for the twenty-nine years.

With respect to low temperatures this statement contradicts some popular local reminiscences. Next to the traditional cold snap of Christmas, 1859, when the mercury in the thermometers was alleged to have been frozen, January 9, 1875, has long been accorded a record of 32 degrees below zero. But the official report very materially reduces that record. Newspaper and other accounts attributed to February 6, 1899, a temperature of 29 degrees below zero, which, also, is not confirmed by the official record.

Denver stands in the midst of Mr. Webster's "region of savages and wild beasts, of deserts, shifting sands, and whirlwinds of dust," and of "endless mountain ranges, impregnable and covered to their very base with eternal snow." Around it over the plains are prosperous smaller cities, with many growing towns and villages lying between; and farmers are profitably and easily tilling hundreds of thousands of acres of his "worthless area." Farther to the east a vast section of his land of "cactus and prairie dogs" is producing corn and pork enough to feed half the people of the earth. To the west of Denver his impregnable, endless mountain ranges, are traversed by many railroads reaching the numerous flourishing mining towns, peopled by a busy population, which every year rescues from the depths of the ranges more mineral wealth of permanent value and utility, than is produced in any like area in the world. Time was when many others beside Mr. Webster declared the Colorado landscape to consist of but two features—great, dreary plains of drifting sand ending at the base of the impassable, appalling mountains of barren granite.

To be sure, these old fantastic beliefs seem incredible, unaccountable to us at this time, when we have bade farewell to the century in the last half of which all this wonderful development of this western domain has been accomplished. Furthermore, as we realize that the work has been no more than fairly begun, we may form some shadowy conceptions of what the future has in store for it. Dr. Hubbard Winslow Mitchell, in his "Evolution of Life," (1891) says of this Denver country:

"So fertile is this area and of such immense extent, that if the Rocky mountain region could be inclosed by a line beginning on the eastern border at the southeast corner of New Mexico, running thence slightly northwest, intersecting the city of Denver, and continuing in the same direction, through Wyoming and Montana, to the line of British Columbia, and by another line on the western border of the mountains, exactly parallel to it, and intersecting Salt Lake City, it would comprise a territory of sufficient extent to support the entire population of the earth.

"The agricultural and mineral resources of this vast area would profitably employ and comfortably support all the people that now live upon the earth."

* * *

CHAPTER XVIII.

Wild Animals of the Plains and Mountains—Enormous Numbers of Buffalo—Their Wanton Slaughter and Practical Extinction—Antelope—"Wild" Horses—Wolves and Prairie "Dogs"—Bears—Mountain "Lion"—Elk, Deer, and Mountain "Sheep"—Insect Pests—Approaching Extermination of Many Types of Wild Creatures.

Animal life existed in this great western empire on a scale befitting so vast and favorable a region. In the early years of the past century the buffalo on these plains were literally countless. All estimates of them were mere guesses and probably on the conservative side. At times single herds would blacken the hills and valleys as far as the eye could see. Out where the sky bent down to the earth there were as many all around as there seemed to be immediately in front of the spectator. The demands made upon them by the Indian population, before the white man came with his deadly rifle, had no appreciable effect in diminishing their numbers.

There were no antagonistic animals on the plains capable of causing them much trouble. The big, white "buffalo wolf," and his smaller kinsman, the gray wolf, were their worst pests; but these enemies had to confine their assaults chiefly to the young, the decrepit aged, and the accidentally disabled. The adult animals, when associated in numbers, and in possession of their natural defensive abilities, cared little for the hungry attentions of these gentry; but, when even a full-grown bull was caught off by himself, by a pack of famished wolves, he was often surrounded, worried and dragged down, by them attacking him in the flanks and rear. The coyote was beneath notice. Thus, without particularly destructive enemies, and with a boundless feeding ground, the buffalo had little to do but multiply and replenish; and they did both with praiseworthy diligence.

Originally these animals ranged over all the central portion of the North American continent, as far east as the eastern part of the State of New York, and west over the great Utah basin and down the fertile valley of the Columbia river. From the latitude of central Texas they roamed northward far into the plains of British America to the latitude of the lower confines of Hudson's Bay. They fast melted away before the encroachments of the white men's settlements, and the last one killed east of the Mississippi, went down in 1832. Up to 1836 they still flourished in large numbers along both sides of the Missouri river, and from that stream out here to the Rocky Mountains their droves dotted and darkened the landscape for miles in every direction.

When Lewis and Clarke ascended the Missouri river on their famed exploring expedition, they encountered a herd crossing that stream in such numbers that the animals choked it for a distance of several miles, and compelled the exploring party to wait a considerable part of a day for the great shoal of beasts to pass across.

At so comparatively recent a time as thirty years ago there were enormous herds between Denver and the then settled parts of Kansas and Nebraska. Of some of them Colonel Inman says:

"In the autumn of 1868 I rode with Generals Sheridan, Custer and Sully, and others, for three consecutive days, through one continuous herd, which must have contained millions. In the spring of 1869 the train on the Kansas Pacific Railroad was delayed at a point between Forts Harker and Hays, from nine o'clock in the morning until five in the afternoon, in consequence of the passage of an immense herd of buffalo across the track. On each side of us, and to the west as far as we could see, our vision was only limited by the extended horizon of the flat prairie, and the whole vast area was black with the surging mass of affrighted buffaloes as they rushed onward to the south."

"On either side of the tracks of the two lines of railroads running through Kansas and Nebraska, within a relatively short distance and for nearly their whole length, the most conspicuous objects in those days were the desiccated carcasses of the noble beasts that has been ruthlessly slaughtered by the thoughtless and excited passengers on their way across the continent. On the open prairies, too, miles away from the course of legitimate travel, in some places one could, walk all day on the dead bodies of the buffaloes, killed by the hide-hunters, without stepping off them to the ground."

The females were about the size of an ordinary cow, but the males were twice as big and presented an exaggerated aspect of ferocity. They were clumsy, lumbering creatures, but when wounded and brought to bay, they became dangerous customers. Many a hunter forfeited his life, and that of his horse to boot, to the charging fury of a wounded buffalo bull, which could gore and rip and tear with the strong stumpy horns of his shaggy head, with amazing dexterity.

It was asserted by hunters and other observers that a herd would post sentinels on surrounding elevations to keep watch and give warning of approaching danger, and that calves and half-grown youngsters which were the favorite victims of the ever-hungry wolves, were carefully guarded in the center of the drove. While they were not combative animals, and greatly desired to be left alone, the bulls would have frequent encounters, inspired by pride or provoked by jealousy, between themselves; and the wolves would often profit by the result of the combats.

Ordinarily a drove of buffalo was no more dangerous than a drove of Texas cattle; often far less so. At the first sign of danger the herd would put off on a slow, bumping sort of gallop, but could be easily overtaken by a fair, average horse. They would crowd along blindly, and if a precipice or the abrupt bank of a stream stood in their way, over it they would go, tumbling in heaps, crippling, or trampling to death many of their comrades. Again would the "prairie lawyers," as the irreverent plainsmen nick-named the attentive wolves, have a satisfactory feast.

Herd of Buffalo—The Superintendent's Peril.

It was a perilous thing for a man and his beast to be in front of a stampeded herd of buffaloes and unable to avoid the oncoming mass of blindly galloping creatures. They would overwhelm him in a moment, the weight of their heavy bodies on their sharp hoofs quickly mince him to pieces, and all that would be left would be a few pulpy masses ground into the dust by the myriad feet of the passing drove. Many a man so lost his life, and many were the tales in earlier times of a narrow escape from such a fate. The experience of R. B. Fuller, a division superintendent of the old Leavenworth & Pike's Peak Stage company is a fair example of such an adventure.

He was riding the route of his stages and while passing through a depression in the plains a rushing drove of several thousand buffalo suddenly appeared, bearing swiftly down upon him. He was riding a mule, and the beast with characteristic perversity balked, either through natural stubbornness or sudden terror, and refused to budge an inch. A leading bull struck the halting creature amidship, gave him a rip and a capsizing shove, and the mule with his rider still astride him, fell dead in a motionless heap. The animal's body protected Fuller, who quickly drew his revolver and fired its charges in rapid succession, but not before several of the foremost buffaloes had jumped over him and what was left of the mule. The reports and smoke caused the herd to divide and swerve to each side, the two columns passing the unharmed man in a few minutes. This was an example of many such incidents, with the exception that its ending was more fortunate than most of them.

In a few years the great host of these creatures was swept from the face of the earth. The fur companies early began the slaughter, and prior to 1850 shipped buffalo hides to the east by tens of thousands annually. The American Fur Company is credited, or accused, of having marketed more than fifty thousand in one season. The passing emigrants, beginning with the movement to California in 1849, and following in the greater multitudes that marked the era dating from Denver's birth, caused the destruction of many more thousands. The ambition of every wayfarer across the plains was to kill a buffalo at as early a stage of the journey as he could, and to repeat the feat as often as he could. Of course, many of those thus slaughtered were for needed food, and the loss in numbers from this cause was not very disastrous to the buffalo. However, it made the herds keep farther away from the overland passages after the spring of 1859, and to be shyer than they previously had been. Yet, for more than a decade after that time the Denver market was well supplied with buffalo beef, the younger animals yielding excellent steaks. But when the white "hide hunters" later appeared on the scene the fate of the great beasts of the plains was sealed, and their doom came swiftly. These men, even more relentless than the fur companies' people, hunting in squads would assail a herd and hang on to it until it was annihilated—not one animal escaping. The hides were removed and later became the comfortable "buffalo robes," or "buffalo coats," while the carcasses were left to rot on the ground. Thus, the herds were pursued from place to place by these pitiless butchers until all were gone. No such slaughter of God's creatures was ever known in the history of the world as that of the buffalo on these plains. It was sickening, wholesale destruction, with a few greasy dollars for each hide as the only incentive and reward.

A large part of this wanton, brutal butchery was accomplished in the few years between 1860 and 1875. The "hide men" had the co-operation of hundreds of pretended sportsmen who came from all over the country and from England and other foreign lands, to take part in the disgraceful slaughter. These men wantonly killed for the brutal love of killing, leaving the carcasses of their victims to be skinned by the "hide men" to the latter's satisfaction and bloody profit. So things went along until a most interesting and valuable animal was all but exterminated. As a sport, it became toward the end, about as thrilling and sportsmanlike as shooting so many milk cows; the bedeviled creatures having lost all their former defensive combativeness.

A business that followed the practical extermination of these beasts, and one that is not yet wholly abandoned, was that of gathering buffalo bones from the plains where they were so abundant, and shipping them to makers of carbon and fertilizers. It was a lucrative business for many men. Thousands of car-loads of these bones have been transported beyond the Missouri river. At many wayside stations along the railways they were seen corded up and stacked in great heaps, awaiting transportation. The amounts yielded by these relics added to the pitiful sums received for the fresh hides, less freight and expenses, constituted all there was to show for the shameful annihilation of the vast herds of these harmless and valuable animals. A small number, guarded by the government in Yellowstone Park, a little bunch reported to exist in Routt county in northwestern Colorado, and another far up on the headwaters of the South Platte river, with a few individuals in zoological collections, such as the small herd in our City Park, are the sole survivors of the once countless host.

Of the extent of the traffic in buffalo bones for some years after the construction of the railroads across the plains, we quote the following remarkable statement from Inman:

> "An idea may be formed of how many buffaloes were killed from 1869 to 1881, a period of only thirteen years, during which time they were indiscriminately slaughtered for their hides. In Kansas alone there was paid out, between the dates specified, two million five hundred thousand dollars for their bones gathered on the prairies, to be utilized by the various carbon works of the country, principally in St. Louis. It required about one hundred carcasses to make one ton of bones, the price paid averaging eight dollars a ton; so the above-quoted enormous sum represented the skeletons of over thirty-one millions of buffalo. These figures may appear preposterous to readers not familiar with the great plains a third of a century ago; but to those who have seen the prairie black from horizon to horizon with the shaggy monsters, they are not so."
>
> "These statistics I have carefully gathered from the freight departments of the railroads, which kept a record of all the bones that were shipped, and from the purchasers for the carbon works, who paid out the money at various points. Some of the bones, however, may have been on the ground for a longer time, as decay is very slow in the dry air of the plains."

Colonel Inman's estimate of the weight of the buffalo's skeleton is probably a serious error in his calculations, resulting in a greatly magnified conclusion. The animals were, however, slaughtered literally by millions during the years he specifies.

The antelopes were the most beautiful and graceful creatures of the plains. While they were abundant, they did not equal in numbers the great, shaggy buffalo, of which they were often companions. Their flesh was highly esteemed as food and they paid dearly for maintaining its fine qualities. Their bodies were so nearly the color of the dry grass and earth that they were almost indistinguishable at any great distance. But when they were headed away on a run the patches of white hair below their tails betrayed them at once. These would comically bob up and down as the fleet-footed creatures put distance between themselves and suspicious objects.

The antelope often fell a victim to his overladen sense of curiosity. The hunter would stand a stick or the ramrod of his gun in the ground, attach a handkerchief or bit of colored cloth to the upper end, and lie await as the signal flapped in the breeze. The antelope, noticing the unusual object and curious to learn more about it, would slowly approach to his doom. These handsome, graceful, swift little creatures, with their large, dark, liquid eyes, were slaughtered as ruthlessly as their larger associates, and are now, also, about exterminated. In a few remote sections, small herds still exist, but they are but the merest remnants of the hundreds of thousands that flourished thirty or forty years ago.

There were no wild horses on the western plains nor anywhere else in the United States, in a strictly correct sense. That is to say, there were no wild horses native to the region, as the buffalo, elk and antelope were. The horse was unknown to the Indians until after the advent of Europeans on this continent. East of the Mississippi it was not adopted and used to any extent by the red people before they were deported from that section of the United States. Here in the west at the beginning of the past century a considerable number of horses ran wild upon the plains, and it was from this stock that the western Indians obtained their original supply by capturing the colts and domesticating them. The aggregate of these animals possessed by the different tribes would have been many thousands.

The "wild horses" of the plains were descendants of those brought into Mexico and New Mexico by the Spaniards, some of which escaped or were liberated, and took to a free life in the vast country. Whatever the original animals of the Spaniards' may have been, their descendants were smallish, wiry, hardy beasts; and ugly, withal. Whether those possessed by the Indians had been degraded by the rough and ignorant treatment received from the savages, or whether the wild stock had been run down by exposure to the elements and a generally rough and tumble life is, of course, not known. But the Indian pony was well adapted to the uses to which he was put, and his hardiness, great endurance and general toughness of both physical and moral character, make him peculiarly suited to his present service under white men in the west.

A popular story in the older books was that of a beautiful, large, white stallion, with glossy, jet-black ears, the able leader of a great drove of wild horses of size and beauty second only to that of their snowy commander. Repeated efforts were made to capture the magnificent animal, but he always succeeded in avoiding servitude, and in guiding his associates beyond the reach of the covetous white man. This drove was reported to have been seen at different times in localities all the way from Omaha to Santa Fe, and from Wyoming to Texas. A story so interesting and appropriate ought to have been true.

The white "buffalo wolf" and his smaller half-brother, the gray wolf; the shaggy brown, and the black wolves; all ugly, howling and hungry, once made themselves much in evidence in the mountains and on the plains, but are now infrequently seen, the few survivors keeping themselves in the remoter background. Except when in considerable packs, and famished by hunger, these unpopular beasts were not very dangerous to man. They were naturally cowardly sneaks, and their fighting qualities were exaggerated in the earlier stories, like most everything else told of the great west in those days. These creatures, except, as we have said, when given the courage inspired by numbers and made desperate by hunger, preferred to avoid close contact with man. Their humble relative, the timid, barking, coyote—the "medicine wolf" of the Indians—is a harmless little wretch who has managed to escape destruction and still flourishes in some localities. Aside from his raids on sheep and other small deer, he is not troublesome. In the old times he was usually found hanging around his larger brethren waiting for the fragments that could be snatched from any feast good luck might put in their way.

The frisky little prairie dogs, which are not any sort of dogs, at all, but resemble fox squirrels excepting in their somewhat shorter bodies, and short tails, are the only wild animals of the plains that survive in large numbers. People who have eaten their flesh pronounce it palatable, and in quality about as good as that of a rabbit. Large communities of them flourish in many places. They were objects of great interest to the emigrants, and the occasional presence of a rattlesnake and more frequent appearance of small owls in the dog towns, led to the conclusion that these undesirable visitors habitually shared the homes of the little beasts; and it was fashionable for every writer of western tales for eastern consumption, to tell of the strange family that resulted from such a combination of tenants. In vain did the pioneer residents who had carefully observed the habits of all three, insist that the owls and snakes were there in search of their dinners, for which the young puppies made fine material; and the undeserved reputation for so foolishly sharing his home with such dangerous enemies still clings to the prairie dog.

He dwells in a burrow which is frequently excavated five or six feet in depth, the spoil from the digging being heaped at the entrance, into a small mound. On this the timid animal spends much of his time, sitting erect on his haunches and hailing his friends and neighbors by the little yelps or barks from which he derived his unbefitting name.

Among the other smaller fry of native four-footed creatures, all surviving in diminished numbers the presence of the destructive white man, are the lynx and the wild cat, the wolverine, three or four varieties of foxes, the mink, badger and pine marten, a few lonesome beaver, and four types of hares and rabbits—the latter being in great plenty and good promise of continuing so.

The wild ducks and geese still come and go, and with them swans are sometimes seen. In distant localities affording agreeable and comparatively secure abodes, wild turkeys may yet be encountered, and prairie chickens are to be found in many places on the plains. In the mountains the mountain grouse flourishes, and changes the color of its plumage in harmony with the changing aspects wrought in the landscape by the successive seasons. In the lofty highlands to the northward where the frost holds sway through longer periods of the year, the ptarmigan, whose feathered garb also turns from white to brown as the snowy season lapses, may be found by those with sufficient fortitude and endurance to seek him in his lonely, elevated haunts.

In the mountain districts the bears once were numerous, and often raided out on the plains. They mustered the black, cinnamon and the grizzly, and the latter was the central figure of action in many thrilling hunting stories of unutterable interest to their boyish readers. When Fremont's expedition of 1843 was encamped here on the site of Denver, some members of the party encountered a big one near the mouth of Cherry creek, but let him get away. The grizzly is the largest and most ferocious of his species. With a weight equal to that of a good-sized horse, a vitality capable of enduring many wounds, and a most fearless and combative disposition, he is hard to kill, and still harder to manage if his hunter only wounds him. Probably he survives in distant and unfrequented parts in the mountains, but it is several years since one was last seen anywhere near Denver. The same may be said of the cinnamon bear, which is nearly the size of the grizzly, and almost his equal at close quarters, though not so difficult to disable or kill. The black bear has not been brought so near to extermination, and still flourishes in some of the mountain parts. He is more easily managed by the hunter, and takes not unkindly to captivity, being a familiar figure in most zoological collections. However, all of them are close upon the common fate of the other large wild creatures of the Colorado country.

Union Pacific Passenger Train stopped by a herd of Buffalo. (From a picture made in 1870.)

The "mountain lion" is another rather formidable beast, but not altogether so dangerous as his name might imply; and his name, by the way, does not very happily apply to an animal of his appearance, manners and habits. He is a cat all right enough, but ranks with the panthers and cougars. He stands about two feet high when squarely on his legs and out of his habitual crouching, has a body near four feet long, and is a most skillful climber of trees. In the pioneer times it was not unusual for these stealthy creatures to present themselves at night in the vicinity of the gold-hunters' camps, where they were sometimes mistaken in the darkness for the large gray wolves of the prairies. It is recorded that one of them attempted to enter a tent in Auraria one night, late in the autumn of 1858, where a man had died of a fever a few days before. These animals are still numerous in the mountains, and are not unduly dangerous to hunters who seek their lives for the sake of securing their handsome skins, for the creature rarely courts encounter with a man.

Along the foot-hills, in the valleys and the mountain parks, in the days of Denver's founding, elk and several kinds of deer were so abundant that they almost trod upon each other's heels; and the mountain sheep in large numbers looked down upon them from the eminences. So plentiful were these animals that the pioneers of the Pike's Peak country had no difficulty in keeping their larders well supplied with changes of good meat food, when they were satiated with their routine provisions. The deer and elk were the favorites, the mountain sheep being held in less esteem.

This queer creature, which is really an antelope, is larger than its domestic, wool-bearing namesake, and has no wool. Its name is about as much out of the way as that of the mountain lion. Its head slightly resembles that of a sheep, but the horns, especially the huge ones of the male, destroy much further similarity, and give to the head an appearance more like that of a goat.

The male is much larger than the female, and both have horns, those of the latter being about six inches long, pointed and somewhat flat; those of the male grow to the relatively great size of from five to six inches in diameter at the butt and, if straightened out, would be from two to three feet in length—the animal being largely horns, and the arrangement a good one, as the male does all the fighting. This equipment renders other useful service, for, in his reckless jumping downward the male sometimes misses his footing and strikes on his head, his horns acting as a kind of buffer to receive the shock of impact. In color the mountain sheep vary from a dingy white to a dark brown, or the grayish brown of the deer. A section of pure white extends from ham to ham, and includes the tail, which is short, and tipped with black. Instead of the wool their badly-chosen name suggests, they have hair like a deer, and shed it annually. They "ba-ah" like the domestic sheep, and the males are quite combative among themselves. They choose their abodes in the mountain regions that are most difficult of access, and are extremely hard to capture alive, even when young. It seems difficult for them to live away from their mountain haunts, and few have long survived captivity. For this reason they have been rarely seen in zoological collections. They are now extinct in the region for many miles around Denver, but a few still exist in the remoter parts of the Colorado mountains.

When George A. Jackson, the gold discoverer, was prospecting on Clear creek in January, 1859, he found hundreds of mountain sheep assembled around the hot springs which, in later years have made Idaho Springs a noted place. The sheep were there for water, and to feed on the grass which the warmth and moisture of the locality had stimulated to luxuriant growth, the same influences keeping it free from snow during the winter season.

The bears, reduced to a few individuals, have followed the surviving sheep into distinct hiding places, but the deer and elk of the mountain districts have not yet become so exclusive, and still flourish there in considerable numbers, with a tendency believed to be toward increase.

Some of the pioneer white men in this Rocky Mountain country asserted that the carrion fly, the common house-fly, the chincha, the mosquito and sundry other insectivorous pests of civilization, were not known in this region until after immigration streamed into it; and that these unwelcome visitors had no sufficient bases of operations until such were afforded by the settlements. This pioneer theory is not recommended as an established fact; but however it may have been with the flies and their relatives then, it is certain that those unpopular beings have since found neither the country nor the climate unfriendly enough to induce them to leave.

The presence of the civilized white man is fatal to the co-existence of wild creatures, whether wild beasts or wild men, and both go down before him as the grain falls to the sickle. His needs are so many, or he makes so many of them, that beings living a primitive life take up too much room in gaining a livelihood, to have the approval and toleration of the self-esteemed, more highly developed creature.

The game laws of the State of Colorado, though they were slow in reaching their present comprehensive scope, are doing much to prevent the total extermination of the beautiful, graceful and interesting wild animals of its territory. Under an intelligent, undiscriminating execution of these laws, many of these animals, especially those having their abodes in the mountain districts, may be preserved. Those of the plains are gone never to return, and it is improbable that the buffalo will be enabled to rehabilitate himself, even in small numbers, from the few surviving members of his species existing in the State. He requires large ranges, and the fine mountain parks that would accommodate him so well are utilized for other purposes. His return to the plains is not to be considered, and therefore, about the only hope for him lies in the direction of Yellowstone Park, where it is possible small bands may find sufficient protection to enable them to remain in the world as shaggy wards of the Nation.

The carnivorous animals, being outlaws under the statutes of Colorado, may be expected to disappear before many more years elapse. Under the relentless warfare waged against them, they have suffered heavy losses which, repeated a few times more, will end them. A popular winter sport is that of hunting them in organized parties of men, and these gatherings have been brought together by excursions on the railroads. When the locomotive sets out to hunt the mountain lion, the beginning of the end of Colorado lions is not far away.

Mr. Greeley recorded sundry opinions, including his own, of the edible qualities of certain game animals in the Denver region, and of others not usually classed as game, which had been tried by some of his companions, as they claimed. His recital is not without evidence that the good man's receptive nature had been imposed upon by his counsellors. He said:

> "I find buffalo beef to be a tough, dry wooden fiber, only to be eaten under great provocation. I infer that it is poorer in spring than at other seasons, and that I have not been fortunate in cooks. Bear, I was surprised to learn, is not generally liked by mountaineers—my companions had eaten every species, and were not pleased with any. The black-tailed deer of the mountains is a general favorite; so is the mountain-hen or grouse; so is the antelope, of course; the elk and mountain sheep less decidedly so. None of our party liked horse, or knew any way of cooking it that would make it really palatable, though of course it has to be eaten occasionally, for necessity hath no law—or rather, is its own law. Our conductor had eaten boiled wolf, under compulsion, but could not recommend it; but he certified that a slice of cold, boiled dog—well boiled, so as to free it from rankness, and then suffered to cool thoroughly—is tender, sweet and delicate as lamb."

Although killing the buffalo for its hide had been a business enterprise of the fur-trading period, it was then done principally by the Indians to enable them to get something they could barter for firewater and other necessaries supplied by the traders. Therefore, while the aggregate slaughter was great, it was not like the wholesale butchery that ensued when bands of white men took up the business as a trade. As late as the coming of the gold-seekers of 1858, the wild animals of this western country had not learned to look upon man as the most dangerous of all enemies, and would frequently draw near to passing wagon trains, and emigrant camps, in innocent curiosity or in search of food.

Their experience with the transient stream of California emigration had been forgotten, and they did not realize that the ruthless being who had again come among them, had come to stay; and to mar the beautiful natural meadows with winding wagon roads, muddy the clear streams, cut away the forests, disembowel the hills and cover their slopes with unsightly rubbish, tear out the gulches, exterminate the wild creatures of the region and drive out the wild lord of the soil, and bring in the rushing locomotive to go screaming across the plains and shrieking over the mountains; and, as with magic, build towns and cities in the land that had been all their own through so many, many years.

CHAPTER XIX.

Early Rumors and Discoveries of Gold—Old-Time Stories and Traditions—Circumstances Leading to Organization of the Russell Party in Winter of 1857-58—Its Progress Across the Plains and Arrival at Mouth of Cherry Creek—Organization and Coming of the Lawrence Party—First Ascent of Pike's Peak—Effect of These Western Movements.

At the close of the first half of the past century the westward tide of emigration had fringed the Missouri river, from the site of Kansas City to that of Omaha, and beyond, with various rude hamlets, straggling towns and embryo "cities;" and some of it had passed across to the prairies of eastern Kansas and Nebraska. Missouri had been a State since 1820, and Iowa since 1845. The great river which bisects Missouri was the natural highway leading to what was then the Far West.

In May, 1854, the Territories of Kansas and Nebraska were created by act of Congress, and organized government, such as it was, in the new region, gave fresh stimulus to the advancing civilization. For several years after, the people of the more populous Territory of Kansas were in embroilment that was practically a state of civil war, and their dissensions and strife diverted public attention from the farther west, the dormant possibilities of which had long been clouded by the fabulous earlier stories of the "Great American Desert."

The value and resources of the Louisiana Territory had for years before been discussed by those who upheld and those who condemned its purchase; and between the roseate views of its friends and the desolate pictures made by its opponents, the public mind had been left in a state of awaiting doubt. One of President Jefferson's defenders, in a little book published at Cincinnati a few years after the purchase, ventured the following somewhat optimistic statements about the Rocky Mountains:

> "These mountains are supposed to contain minerals, precious stones, and gold and silver ore. It is but late that they have taken the name 'Rocky Mountains;' by all the old travelers they are called the Shining Mountains, from an infinite number of crystal stones of an amazing size, with which they are covered, and which, when the sun shines full upon them, sparkle so as to be seen at a great distance. The same early travelers gave it as their opinion that in future these mountains would be found to contain more riches than those of Indostan and Malabar, or the golden coast of Guinea, or the mines of Peru."

The views of this worthy old chronicler, barring the harmless deception of the huge, light-reflecting crystal stones practiced upon him by his "early travelers," have been well sustained by developments of later years.

The decline of the fur trade after 1840, caused most of the restless, adventurous, sparse population in this region to seek other fields of activity and usefulness. Without the fur business, or with a steady and portentous diminution of it, they could see little ahead to keep them here. The gold discoveries in California, recounted in the exaggerated forms assumed after a journey of more than a thousand miles, attracted many from this intermediate territory, and by the close of that decade a census would have shown a great reduction in the number of white people—none too great at any time—in this part of the country. The Indians were growing more restless and troublesome, and were becoming disposed to open hostility. So, all the conditions tended toward the abandonment of the region by the majority of the white adventurers, who had about exhausted what they considered its resources, and who were largely birds of passage, anyway.

True, there were some who believed that new sources of wealth awaited discovery and development. Aside from the old Spanish stories of gold and silver in these mountains, there were traditions of gold nuggets carried in the pockets of trappers and mountaineers in earlier times. There were old tales growing out of Pike's expedition in occasional circulation; and others, of more indefinite character, coming from no one knew just where.

That hunting for the precious metals was the leading purpose of Coronado's long, fatiguing, resultless expedition into this general region in 1540-42, is indicated by the tone of disappointment in the published Spanish account of it, in which the statement is made that after reaching the fortieth parallel of north latitude, and "finding no gold, they returned to Mexico."

While Lieutenant Pike was detained at Santa Fe he fell in, as we have related, with James Pursley, to whom we have heretofore referred as one of the pioneer Americans in this part of the world. Pursley is represented in some of the accounts to have told Pike that he had found gold on the tributaries of the South Platte; and that when he was in the South Park had found more, some grains of which he exhibited with the assertion that he brought them out of there himself when he started for Santa Fe.

Of his interview with Pursley, Pike says in his "Account:"

> "He assured me that he had found gold on the head of the Plate [the South Platte] and had carried some of the virgin mineral in his shot pouch for months, but that being in doubt whether he should ever again behold the civilized world, and losing in his mind all the ideal value which mankind have stamped on that metal, he threw his sample away; that he had imprudently mentioned it to the Spaniards, who had frequently solicited him to go and shew a detachment of cavalry the place, but conceiving it to be in our territory he had refused, and was fearful that the circumstance might create a great obstacle to his leaving the country."

Pursley also said that the large band of Indians with which he had come into this part of the country, had left in the South Park the evidence of a numerous company's previous visit, which had attracted the explorer's attention when he was there. There is no record that Pursley ever went back to the South Park to develop his discovery, nor is anything further known about him.

The hunters and trappers of the fur-trading period learned of the existence of gold here, but without giving the knowledge much consideration, soon after they had come into this part of the country. As early as 1832 some of them found small quantities of it in the beds of the mountain streams. For several years thereafter it was not a rare thing for men to bring in to Vasquez's trading post, then at the mouth of our Clear creek, a few bits of gold they had found in their wanderings in this region. But so scant was the attention given these incidents at Vasquez's that they occasioned but passing notice, and no attempt was made to look for gold as a business. No one took the trouble to identify the localities where these small vagrant collections of dust had been made, so destitute of importance and significance did they appear to the men then attached to the Vasquez trading post.

One of the trappers roaming this region in these old times was a French Canadian named Duchet. An old story makes him one of the finders of gold in these parts "away back in the Thirties," also. It appears that he picked up in Horse creek—a South Park tributary of the South Platte—a piece of disintegrating rock that was rich in gold; that he carried it in his hunting pouch until he got tired of it, and then, without realizing its value, but regarding it only as a novelty, threw it away. A short time afterward, while at Santa Fe, the emptyings of his pouch containing small particles of gold, instantly attracted attention from men down there who appreciated their significance, and who besought Duchet to identify the creek upon which he had picked up the gold-bearing rock. But the old trapper could not again find the place, nor could any one else.

Sage, the hunter and trapper hitherto mentioned as one of the pioneer mountain men, seems to have known the general mineral character of this region, but his opinions involved theories quite different from those commonly entertained. He was a man above the average of his class, and kept a record of his daily adventures and observations, which he afterward published. Hollister says "he was somewhat of a sage by nature as well as in name." In noting his experience in the winter of 1843-44, while crossing the divide between Cherry creek and the Fontaine-qui-Bouille, Sage presents the following unique theory of the cause of certain uncomfortable climatic conditions:

> "The country hereabouts for an extent upwards of one thousand square miles, is much subject to storms of rain, hail, snow and wind. I can account for it in no way but by supposing it to have some connection with the vast quantities of minerals lying embedded in its hills and valleys."

Later in that season Sage found some tangible evidence to support his belief in the mineral character of the country. He had established his camp for the winter of 1843-44 on the side of the present city of Golden, and toward spring picked up in that vicinity several pieces of rock which, he records, he suspected to be gold-bearing. But he did not attach much importance to the matter.

In several places along the front range suspicious excavations were observed in the early days. Finding a copper kettle or two near some of them, gave rise in recent years to the theory that the digging had been done by ancient gold-miners from the ruined cliff habitations in the distant southwest corner of the State. But there is nothing to show that those stone-age people knew anything about mining. It is true, that the pre-historic people once occupying the Mississippi valley were in possession of silver; but it is more than probable that if the excavations referred to were prospect holes, they were made by the Spaniards, who were hungry and tireless seekers for gold wherever there was any prospect of finding it.

The old Spanish records state that after the conquest of the pueblo region and the subjugation of its inhabitants, at the close of the sixteenth century, the Spaniards made slaves of many of the people and compelled them to hunt for gold and silver in the mountain country of the north, but all particulars of these ancient mining enterprises are absent. If those natives ever did any successful work, it must have been in recovering free gold, as there is no evidence that they knew of any method of reducing refractory ores. The Spaniards of that time were but little in advance of them; the carbonates of lead were the only ores they well understood how to manage. Shallow shafts and other indications of old mining operations were observed between the Culebra and the Trinchera in what is now Costillo county, in the southern part of the State. It has been assumed that the Spanish leader Onate and his party, who were in that country in 1595, were responsible for these old workings. Onate represented upon his return home that he had found both gold and silver in the northward region he had visited.

"Spanish Bar" on Clear creek, a short distance below the mouth of Fall river did not, as has frequently been stated, receive its name from evidences of early mining there, but from an incident that occurred in 1859, and of which some account is given in a succeeding chapter.

A historical account of Park county, published about twenty-five years ago by the Sentinel newspaper, of Fairplay, relates that the trapper known as "old Bill Williams" claimed to have found gold in the South Park in 1848, while hunting and trapping there. If he did, he must, like Sage with the supposed gold-bearing pieces of rock found near the site of Golden, have considered his discovery as of little importance, for nothing ever came of it through his instrumentality.

Judge Wilbur F. Stone's historical sketch of Pueblo county, published about the same time, says that "in 1848 the children of William Bent, while camped on Crow creek, on the way from Fort Bridger to Bent's Fort, are said to have gathered small nuggets of gold." Crow creek is a Weld county tributary of the South Platte, but its locality has not been known as a gold district.

Another story of a pioneer gold discovery, that has been handed down with much semblance of accuracy, is that, in 1849, a party was made up in Georgia to go to the Rocky Mountains to have a season's hunt for big game. These people came out here and had their sport, and while encamped at the mouth of the Cache-a-la-Poudre river, in August of that year, are said to have found some gold in the bed of that stream. They are said, also, to have related the character and circumstances of their discovery on their way back east, and after they reached their homes.

In 1849, Governor William Gilpin, who was then Colonel William Gilpin, of the United States army, and whose career later became an important part of the history of Colorado, delivered an address at Independence, Missouri, which obtained considerable circulation through the newspapers along the border. Colonel Gilpin was, of course, well grounded in the natural sciences, and his geological knowledge combined with his personal observatives and examinations, had convinced him, upon his first visit to this part of the country, of the existence of gold, silver and precious stones in the Rocky Mountains. Colonel Gilpin accompanied Fremont's expedition in 1843, which crossed the plains to Fort St. Vrain and from there proceeded up the South Platte. One of the party's camping places after leaving St. Vrain was here on the site of Denver. While with Fremont that summer Colonel Gilpin found traces of gold in several of the streams in this region. During the war with Mexico, in which he rendered distinguished services in New Mexico, Colonel Gilpin commanded expeditions against the Ute and the Navajo Indians, which penetrated the mountain recesses in the San Juan country, and while thus engaged saw unmistakable evidences of gold, silver and copper, in several places. In 1847 he commanded an expedition of twelve hundred troops against the Indians here in this part of the west, who were menacing emigration then setting in by the overland route for the Oregon country and other sections on the Pacific coast. This expedition wintered near Pike's Peak in 1847-48. Colonel Gilpin's renewed researches at that time, following his earlier observations here and elsewhere in the Rocky Mountain country, satisfied him that the precious metals existed in abundance in these ranges, and placed him conspicuously among those who knew, in the first half of the closed century, of the presence here of gold and silver. His conclusions were embodied in his address at Independence—which was also delivered later at other places—and the clearness with which he presented the results of his personal observations may be said to have first given substantial footing to reports of gold existing in the Pike's Peak country.

There are accounts of a cattle-trader named Parks, a Cherokee or a half-breed, who passed through here with a drove of stock in 1852, and while halting at Ralston creek, a small tributary of Clear creek, and which a few years later became the scene of great activity in the search for gold, found some of the yellow metal in the creek's bed. Parks is credited with having had knowledge of gold existing here, from his Indian relatives.

Hollister, in his "Mines of Colorado" (1867) does not mention Parks, but gives this version of a Ralston Creek-Cherokee discovery in the same year:

> "A party of Cherokee Indians traveling overland to California in 1852 via the Arkansas River, and along the eastern base of the Sierra Madre to the North Platte at Fort Laramie, by some means found gold in the banks of Ralston Creek, a small affluent of the Vasques Fork of the South Platte, emptying into it near its mouth; and each year thereafter parties of Cherokees had gone out and prospected the streams in the vicinity of what is now Denver City. At last they were successful; they obtained a few dollars' worth of the glittering dust, which they carried home late in 1857, exhibit-

ing it freely as they passed through Nebraska and Kansas."

"The report of a new land of gold in the west spread like an epidemic through the country drained by the Missouri River, and soon traveled far beyond. These Indians appeared to have gone home and told their story on the confines of the Gulf of Mexico, for Georgians were among the first to seek the new gold country."

Bancroft, in his "History of Colorado," makes the following statement, but does not give his authority for it:

"A party of Cherokees, being en route for California, looking not only for gold, but for a new country in which to locate their people who had been invited to sell their lands in Georgia, taking the Arkansas Valley route, and the trail by the Squirrel Creek divide to the head of Cherry Creek, made the discovery that gold existed in the streams of this region. The party continued on to California, and returned, in time, to Georgia where they attempted to organize an expedition to the Rocky Mountains."

The stories of Cherokee connection with discoveries of gold in the Denver region—and these two are not all of them—have been mixed up in a variety of ways; and Bancroft, by implication, puts the visit of his party "away back in the Thirties," if not earlier. Hollister locates the Cherokee people in Georgia at the time of these alleged western expeditions, and goes even further, by making that State part of "the confines of the Gulf of Mexico." Bancroft also locates them there, and says the members of his party were going to California to buy new lands for their people. Some of this Georgia tribe of Indians, by treaties in 1791, and 1798, gave up their lands in Georgia and moved beyond the Mississippi; there were three thousand of them down on the Arkansas river in 1817. In 1835, those remaining in Georgia, by treaty exchanged their lands in that State for others in the Indian Territory, whither they were all removed in 1838. If the Cherokee party referred to by Bancroft was on the way to California to find a new location for the tribes "who had been invited to sell their lands in Georgia," it must have passed here earlier than 1835; for, in that year, to say nothing of the time previously consumed in negotiations, they agreed to give up their Georgia lands, and their future home was then decided on.

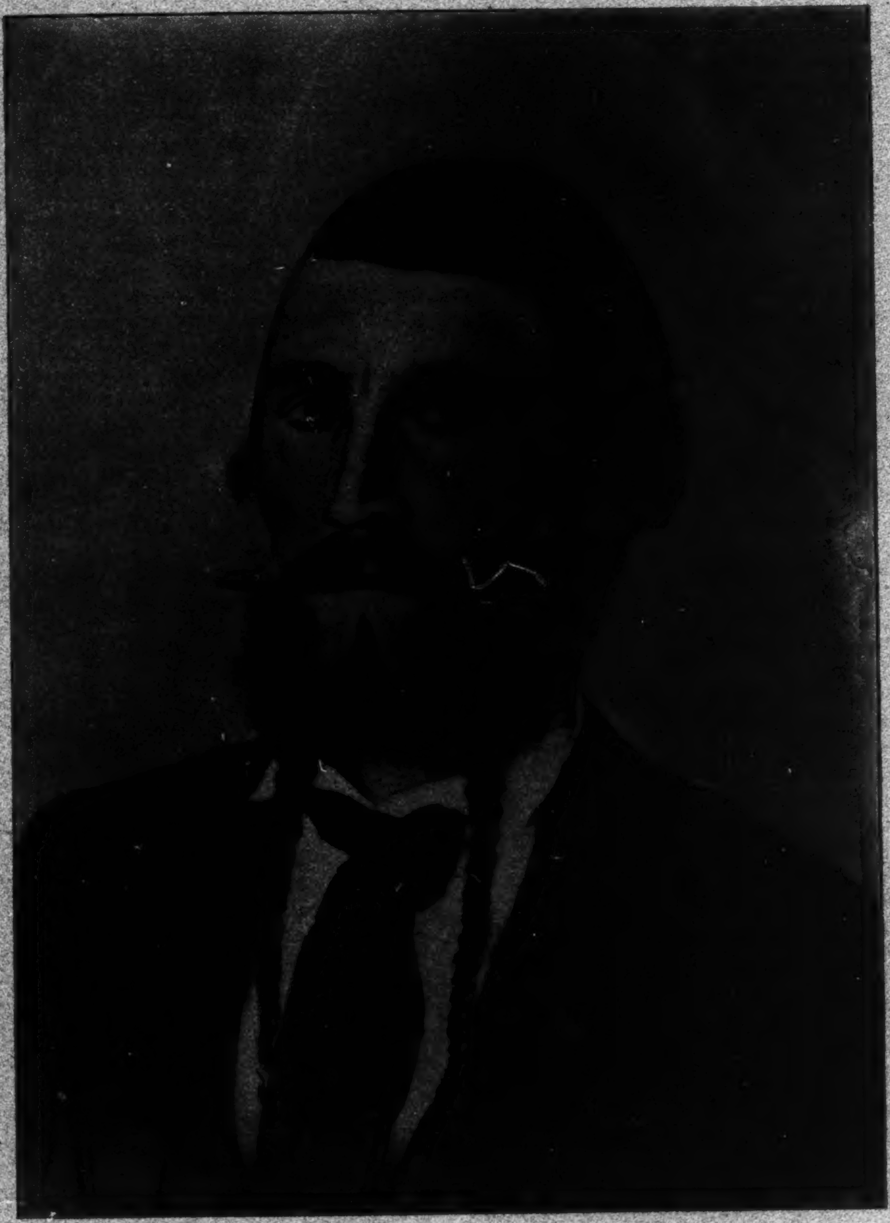
These facts render obvious the confusion in the various traditional accounts of Cherokee prominence in the pioneer events we are about to consider. Indians of that tribe did participate in them, and were indirectly influential in causing the first organized party of white men, to come here from Georgia, to hunt for gold and establish some basis for "the Pike's Peak excitement."

There were two instances of Cherokee gold-seeking here in the general vicinity of the mouth of Cherry creek in early times, concerning which there is now no lack of definite account; but it is due to the personal knowledge of a survivor of those times, who is familiar with all the facts and who was a participator in the events he recounts, that we are enabled to present the circumstantial details of the Cherokee operations and of those ultimately growing out of them. We may say in passing, that the story fails to show that any of the Cherokees made themselves conspicuous as gold-miners in this part of the country when they purposely came here for gold in 1858, or at any other time.

Some of the host bound overland for California after the discovery of gold in that country, having heard the vague rumors, even then existing, as we have seen, about the presence of gold in the Pike's Peak country, came through this way, or turned aside from other routes, and made more or less superficial investigations along the South Platte and its branches; but, with one exception, so far as any definite record goes, without any effective results.

The exception was the work of a party of Cherokee Indians from their country in the Indian Territory, bound for California in the spring of 1850, to dig gold in the newly-discovered fields out there. For the particulars of this expedition, and for many others concerning the history of the pioneer events that eventuated in the settlements at the mouth of Cherry creek, we are indebted to Dr. Levi J. Russell, an active participant in many of them, and who preserved a record of his experiences. If to any one man more than to another the distinction of having been the founder of Denver is to be accorded, it would seem that it is due Dr. Russell. He was a physician in these early times, as he is now, and at this time is a citizen of Heidenheimer, Bell county, Texas, where he is still actively practicing his profession.

In this Cherokee party of 1850 were some Indians who had formerly been residents of northern Georgia, and with them were two white men named Ralston, of Cherokee connection by marriage, and relatives of Samuel Ralston then a citizen of Dahlonega, Lumpkin county, that State. This party traveled westward by the Arkansas river route to the mouth of the Fontaine-qui-Bouille, and then turned northward and proceeded across the Squirrel creek divide to the upper reaches of Cherry creek. After leaving the Fontaine they did some prospecting all along the way and, as they afterward asserted, found small quantities of gold. They followed Cherry creek down to its mouth here at the site of Denver, where they camped and stayed a few days. They prospected the creek, the bed of the South Platte river, and portions of Clear creek —but how far is not known—and claimed to have found some gold in each, but not enough to induce them to abandon their westward journey and remain here to hunt for more. From here they went northward to Fort Laramie, and thence by the



William Green Russell (Deceased).
(From a crayon portrait, 1857; only picture of him ever made. An outline of the later years of his life appears in Chapter XLV.)

South Pass on their way to the coast. They afterward represented that they also found traces of gold in some of the tributaries of the South Platte to the northward of Denver's site. While they were here they gave one of the branches of Clear creek the name it still bears—Ralston creek, in honor of the members of their party of that name. To further circumstances arising from this visit of the Cherokees, and to those attending their second expedition, we shall again refer.

In 1852 when William N. Byers was on his way from Iowa to the Oregon country he stopped at old Fort Laramie, and while there heard stories of gold having been found in the streams putting out from the eastward slopes of the Rocky Mountains by trappers and traders who had long been in the country. He was also told that there were three mountains, or buttes, near each other in what is now eastern Idaho, north of Pocatello, and about half-way between the northern and southern limits of that State, that were enormously rich in silver. We do not know that these mountains have ever been located by miners and made to give up their treasures.

In the summer of 1853 a man named Norton who, with a small party bound for California, had crossed the plains by way of the Arkansas river route, and passed northward along the foot-hills here, to Fort Laramie on his way to the farther west, exhibited at Laramie a small quantity of gold which he stated he had found "down at Pike's Peak." The matter commanded no especial attention at that time, further than to become an occasional subject for gossip among the soldiers and other people at the Fort, and in that form floated away to the Missouri river as one of the vague rumors that there was gold in the Rocky Mountains.

But these earlier stories about gold existing in the Pike's Peak country, growing more and more indefinite as they advanced in age, gradually wore themselves out of public notice, and for several years in the middle "Fifties" but little was said or heard of them east of the Missouri. For a few years after the organization of Kansas and Nebraska as Territories, and in the uproar which ensued over the possibility that Kansas, at least, would become a slave State, the western region was comparatively forgotten, and the thoughts and attention of the people along the Missouri river border were bestowed in other directions.

Late in 1857 there was a revival of the rumors of gold discoveries out at the base of the mountains. Stories more or less indefinite, founded on the reports of trappers and traders returning from the Rockies, and on army gossip, began to make their way again through the settlements and towns along the Missouri river. Whether they were new tales of gold at Pike's Peak, or the old ones re told, it would now be hard to tell. But these renewed accounts, losing nothing by travel, spread the germ of gold fever wherever they went. Time was required for the development of the contagion, winter was coming on, and so that year closed without inaugurating the westward hunt for the precious metal, though public interest in the subject steadily increased.

Through the winter of 1857-58, the newspapers of the States teemed with wild speculations, and exaggerated versions of the Missouri border stories, concerning what was now by common consent called "the Pike's Peak Gold Region," and so called more for convenience than from knowledge. All the old theories, predictions, and travelers' tales were revived and put in commission. The placer mines of California had waxed and waned, and the public mind was ready and eager for new golden sensations from the "Great West," the frontier to which was still nearly within sight of the western borders of Missouri and Iowa.

Among the traders and frontiersmen who ranged over this region in the "Fifties" was John S. Smith of whom we have already given some account in a preceding chapter. As most of his dealings were then with the Arapahoe and Cheyenne Indians, he spent the greater part of his time in this immediate part of the country. Among those who arrived here in the autumn of 1858 a story in some way became current that Smith, in company with some Mexicans had, in the summer of 1857, discovered and taken out considerable gold at a place on the Platte river, about three miles above the mouth of Cherry creek. The spot thus became known in the local annals, as "the Mexican Diggings"—or, by some, as "the Spanish Diggings." While there is no authentic confirmation of the story, by Smith, there seem to be some reasons for believing it may have been true. The place was worked in the summer and autumn of 1858, and some more gold found, as we shall presently relate.

In the spring of 1858 while Captain R. B. Marcy was proceeding from New Mexico to Fort Bridger with some United States troops and supplies, he reached the mouth of Cherry creek on May 3d. Of the discovery of gold here by one of his men, he says:

> "We found the river at such a high stage, and so rapid, that we were compelled to encamp here for four days and construct a flat-boat, in which we crossed our entire party. * * * While our ferry-boat was being constructed, one of our citizen employees washed out from the sands of Cherry creek a small amount of gold dust, which he showed to me."

Captain Marcy's teamster was George Simpson, heretofore mentioned as one of those who claimed to have been a builder of the old "Pueblo," on the site of the present city of that name.

In 1859 a well-known pioneer of Denver, named Samuel Stone, was with a party of hunters and prospectors up on St. Vrain creek. At a place well up in the mountains and near the southeastern part of the base of Long's Peak, the party found evidences of what appeared to be ancient mining operations. There were some partly filled-up shafts, and other excavations, and the remains of several cabins. In what was left of one of the latter Stone found a curious old copper vessel something like a kettle, and a copper "worm" of several coils; the two if joined would have formed a little "still." They appeared to have once been united in a manner to fit them for distilling. Stone brought the kettle and "worm" back to Denver with him, and they lay around his cabin on the west side for a long time, but finally disappeared. William N. Byers saw them and learned the story of their discovery by Stone as above stated. Some years later when Mr. Byers was in Santa Fe he told about this finding of the kettle and "worm" and signs of old-time mining at the base of Long's Peak. He then learned that there was a tradition at Santa Fe to the effect that many years ago—how many, no one knew—a party of Portuguese coming from Mexico, passed through Santa Fe on a mining expedition far to the north; and that the strangers were never heard of again at Santa Fe, at which place, it was thought, they would have stopped on their return journey had they survived their adventures. Whether these copper utensils, the old workings, and the remains of cabins near Long's Peak had any connection with that party of Portuguese is, of course, unknown; but there is a possibility that they had.

The Cherokee party of 1850 remained in California two years. Its members fell far short of finding gold enough there to satisfy them, or in any very large amount; and, like many others, returned to their former homes not violently in love with their experience. Some time after their return, Samuel Ralston's relatives who had been in the party, as we have stated, wrote him at Dahlonega, Georgia, about the discoveries of gold the party had made in this region on the way west in 1850. After some delay Samuel Ralston communicated these facts to William Green Russell, a brother of Dr. L. J. Russell.

W. G. Russell was then in Lumpkin county, Georgia, and in addition to his experience in the not very prolific gold-fields in that part of that State, had been one of the California argonauts of 1849. He went there early in that year overland by way of Fort Bridger—or, rather, by "Sublette's cut-off," and worked some claims with fair success. He returned to Georgia by way of Panama in the summer of 1850, and in the autumn of that year went back to California accompanied by Dr. L. J. Russell, the two remaining in the gold districts of that State until late in 1852, when they returned to their Georgia homes. Neither of them while in California learned anything of the reputed existence of gold in the Pike's Peak country nor had either encountered any members of the Cherokee party while there. Their first information, aside from later vagrant rumors of the existence of gold at Pike's Peak, came through Samuel Ralston who had it from his friends and relatives in the Cherokee Nation, as hereinbefore related. From the Cherokee end of the line later came a suggestion that a party be organized to go out and thoroughly prospect the Pike's Peak country; but, as we will now see, this was not done until several years had elapsed.

Early in the spring of 1857 W. G. and J. O. Russell, J. H. and R. J. Pierce, and Samuel Bates went from Georgia to Kansas for the purpose of locating land claims, which they did on Rock creek. The Russell brothers and Bates returned to Georgia in the summer of that year, leaving the Pierce brothers to look after the several claims. R. J. Pierce, who is now a practicing physician at George's Creek, Arkansas, informed us that he and his brother made a crop at Rock creek that year, and remained there until the spring of 1858, when they joined W. G. Russell's Pike's Peak expedition of that year; the immediate circumstances of the organization of which will presently be related. Dr. Pierce also stated that W. G. Russell, recalling the reports he had received from the Cherokee people through Samuel Ralston, contemplated going to Pike's Peak in 1857 after the land-claim party had reached Kansas. Of the reasons for abandoning that enterprise Dr. Pierce said:

"In May, about the 15th, we arrived at Fort Riley, Kansas. Green Russell had an interview with the commander of that post who refused to let us go farther, as General Harney was then having serious trouble with the Indians in the far west, and many of the tribes were disposed to be aggressive. We were advised to postpone our expedition until the next spring when it would be much safer to make the trip. We then turned back from Fort Riley and went to Rock Creek Falls, Kansas."

This statement having been referred to Dr. L. J. Russell, he said:

"I think Dr. Pierce is in error in recalling after so many years that my brother actually intended to extend the Kansas trip of 1857 to so distant a place as Pike's Peak. Green may have talked about it and made inquiries with relation to the western country, but I am sure he had no serious thought at that time of going to Pike's Peak. Before leaving home for Kansas in 1857 there was no talk of going to Pike's Peak that year. Had the land-claim party left with the intention of going there, the expedition would have been the talk of the whole county. Green did not leave home prepared to make such a trip, nor for a long absence; and he came back about the time he had expected to. He certainly would have mentioned such an enterprise to me before he went away, or upon his return (which he did not) had he really contemplated doing so as Dr. Pierce recalls. It was not until the winter of 1857-58 that a Pike's Peak expedition was seriously proposed among us at our homes in Georgia. Green never mentioned having been at Fort Riley in 1857, nor having gone in that year farther west than the Big Blue, as he certainly would have done upon his return home, or upon our way out in the spring of 1858, were Dr. Pierce's recollections free from the element of romance. Whatever thought Green may have had of Pike's Peak in 1857, he evidently did not consider it of enough importance to mention upon his return home that year, nor at any other time."

When the extravagant accounts, based on practically nothing—because nothing beyond the old, time-worn stories we have recounted, was actually known—of the alleged "new gold-fields at Pike's Peak" were again put into circulation by newspapers and word-of-mouth late in the autumn of 1857, W. Green Russell, who was then at his home in Georgia, resolved to go to the Peak on a prospecting tour. After some correspondence with the Indian Territory people it was decided to jointly organize such an expedition, a part of the men to be from Lumpkin county, Georgia, and the others from the Cherokee Nation. This was the earliest movement toward making an organized attempt by experienced men to systematically search for gold in this Rocky Mountain country. Of the ensuing proceedings in Georgia we quote from Dr. Russell's statement made for this History:

"A party was finally made up in Lumpkin county, consisting of the following-named persons; W. G. Russell, J. O. Russell (a brother), L. J. Russell, Lewis Ralston, William Anderson, Joseph McAfee, Solomon Roe, Samuel Bates and John Hampton. This party left home on the 17th day of February, 1858, and expected to be joined by the Cherokee party at the Cherokee town of Maysville, near the northeast corner of the Cherokee Nation's territory. When we reached Maysville we found that the other party was not ready to move. After a conference with the leader of the Cherokee party, the Rev. John Beck, a Baptist preacher, and a future time and place of meeting agreed upon, our party moved on to Rock Creek, Kansas, where W. G. Russell had taken up land in 1857, and where we went into camp and remained several days. J. H. and R. J. Pierce joined us at Rock Creek, and from that point W. G. Russell, J. O. Russell, William Anderson, Lewis Ralston, and Joseph McAfee went to Leavenworth and exchanged our mule teams for oxen, and procured a general outfit. Upon their return we left Rock Creek and moved to Manhattan, Kansas, where we camped for two or three days. Here we were joined by William McFadding, William McKimmons, Jacob Masterson, Valarious Young, Theodore Herring, J. Brock, Luke Tierney, T. C. Dickson, George L. Howard, and a Frenchman, whose first name, Henry, is the only one I remember. Leaving Manhattan, we crossed the Kansas river near that place and struck out for the old Santa Fe trail on the Arkansas, reaching it near the Great Bend. Here we came up with Mr. Beck and some thirty other Cherokees, on June 3d; they having arrived somewhat in advance of us and we having seen signs of their presence ahead of us for a couple of days."

It is to be remembered that the Cherokee people since their removal from Georgia had advanced far into a state of civilization; quite far enough to thoroughly appreciate the power and value of gold, and to be as keen after it as any of the white people. Beck had little difficulty in recruiting his company of Cherokee prospectors and in getting started; but before going far the party got into trouble with some Osage Indians, and a portion of it becoming apprehensive of further hostile encounters, abandoned the undertaking and went back home.

The others, however, being more determined men, decided to go ahead, knowing that when they joined their expected white associates under Russell, the combined parties would be strong enough to resist any attack likely to be made. The Cherokee division of the expedition, as finally constituted for the journey across the plains, consisted of thirty Indians. Although Preacher John Beck was what we would now call the "promoter" of the enterprise, George Hicks, Senior, was a prominent member of the Indian company. He was a lawyer by profession, had served on the Cherokee bench as Judge, was of decided ability, and a notable man in the Cherokee nation. Aside from John Beck, other somewhat conspicuous members of the party whose names have been preserved, were George Hicks, Junior; Ezekiel Beck, and Pelican Tigre.

J. Oliver Russell.
(Photographed 1885.)

Beck's contingent had been joined by several white people after it started. These were George McDougall, a brother of Senator McDougall of California; Philander Simmons, an experienced mountaineer; Levi Brumbaugh, a man named Kirk with his wife and two children; and four other men, named Brown, Taylor, Tubbs, and Kelly. Kelly had his wife with him, and her sister also accompanied the party. There should be something more to tell about these three women, but the early chroniclers appear to have considered them as historical incumbrances to be abandoned forthwith, rather than as the important personages they certainly were.

Philander Simmons was a mountain and plains man of some experience. He had been attached to Bent's Fort as early as 1842, and was familiar with all the region hereabouts. He had left this part of the country several years before and gone back to Joplin, Missouri, where he had been engaged in lead-mining up to the close of 1857. Before the

Russell party reached the site of Denver he started off hunting game instead of gold and, although he remained in this vicinity, he did not participate in any of Russell's mining undertakings. The later years of his long and adventurous life were passed in Denver, and he died in this city in abject poverty in November, 1899.

The united companies made an imposing caravan, which consisted of thirty-three yoke of cattle, fourteen wagons, two two-horse teams, a dozen or two of ponies, with about sixty people to care for it and be cared for. But not all of the people were bound out to dig gold. Some, including the women mentioned, were destined for Bent's Fort, a few for the mountains, and one, McDougall, was going to the mouth of the Fontaine-qui-Bouille, where, as will later appear, the beginning of a settlement was made the following autumn. He was an eccentric, dissipated genius who sought to bury himself in the wilds of the far west. After the Cherry creek towns were started he came up here.

On June 12th the expedition reached Fort Bent where a brief stop was made. On the 16th the Russell-Cherokee part of it, including Simmons and the men who had in Kansas directly attached themselves to the expedition, left the Arkansas and struck across the country by the way of Squirrel creek to the South Platte-Arkansas divide. Beck claimed that the Cherokee party of 1850 had found gold in the hills down there while passing through them. Russell found nothing and after a day or two of labor in them, crossed over to Cherry creek, and all the party began prospecting as soon as they struck it, and continued their work along its bed without finding anything of importance. Then it was decided to move down the creek to the South Platte. They came in here on June 24, 1858, and, crossing the creek at a point between the present Blake and Wazee streets, went into camp on the west side.

We have entered into the details of the organization and progress of this company somewhat at length because it was not only the first organized party which came to the Pike's Peak region to persistently conduct a search for gold and under the direction of competent and experienced men, but because it made the actual beginning of gold-mining here; and that it was in consequence of the presence here of some of its members that the first permanent settlement was made on the site of Denver. R. J. and J. H. Pierce, members of the party, were relatives of the Russells, and some reminiscences of J. H. Pierce, long a resident of Idaho Springs, are incorporated in this account. When the party went into camp here on the 24th of June there was neither a white man nor the sign of one around the mouth of Cherry creek; nor were there any Indians within sight.

The Russell party came near not being the first organized company of gold-seekers in the Pike's Peak country. Not far behind it was another band, almost as large, winding its way across the plains. The new rumors of gold being in plenty at the Peak, or the new versions of old ones, had reached Lawrence, Kansas, in the winter of 1857-58 as they had every other place along the Missouri border, and were so persistent as to excite great interest in that town. In the spring of 1858 two Delaware Indians reached Lawrence from the west and had with them a small quantity of gold dust and nuggets. Their names were "Little Beaver" and "Fall Leaf." The latter represented that he had served with Fremont as scout and guide; that while in the explorer's service had discovered gold existed in the streams of the Pike's Peak country; and that the gold he then exhibited in Lawrence, he had collected while out here the previous summer and autumn.

The story told by "Fall Leaf," and the yellow evidence with which he substantiated it, made a profound sensation in that little frontier town. A meeting of adventurous younger citizens was held, and a company organized by John Easter to go at once to Pike's Peak. These Lawrence men who constituted what is known in the early annals of Denver as "the Lawrence party," were men of action, for they completed their arrangements, got their wagons and draft animals, collected provisions, supplies and tools for a season's operations, and started on their long journey on the 19th of May. Their company comprised Albert W. Archibald, A. F. Bercaw, Giles Blood, Frank Bowen, Joseph Brown, W. J. Boyer, William Chadsey, John A. Churchill, Frank M. Cobb, William Copley, —— Cross, John Easter, Adnah French, Peter Halsey,

John Easter.
(From a recent photograph.)

William Hartley, Josiah Hinman, Mrs. Anna A. Holmes, Charles Holmes, George Howard, Howard Hunt, Roswell Hutchins, "Pap" Maywood, William McAllen, —— McKay, John D. Miller, Austin R. Mills, Robert Middleton and his wife and child, Charles Nichols, William Parsons, George Peck, Robert Peebles, William Prentiss, William Regan, Charles Runyon, George W. Smith, Nicholas Smith, J. H. Tierney, Jack Turner, Augustus Voorhees, James H. White, A. C. Wright and Jason T. Younker; with J. H. Tierney, as the guide, or leader.

This Lawrence party also came out by the Arkansas river route and was only ten days behind the Russell expedition. Some of the accounts say the Lawrence people knew nothing about Russell's expedition being ahead of them, nor about it being in the country after they reached the mountains. This is altogether erroneous, as they heard of Russell's large caravan before they came to Bent's Fort, which was a halting place for both. The Lawrence party followed the Arkansas to the mouth of the Fontaine-qui-Bouille and then turned northward, and on the 5th of July went into camp at Pike's Peak, which they fondly believed marked the location of the fortunes awaiting them.

After the party had settled in camp, Frank M. Cobb, John D. Miller, and "Gus" Voorhees ascended to the top of the Peak. They looked for signs of previous visitors there but found none. Other members of the party, including Mrs. Holmes,—the first woman who ever did so—went to the top of the Peak a few days after Cobb and his companions returned from their trip. These Lawrence folks appear to have been the first men who reached the summit of the Peak.

It is to be remembered that at this time this region here at the base of the mountains was not altogether unfrequented by white men. While the Russell and the Lawrence parties were the only organized companies out here on the search for gold, there were several individuals and little parties of two or three persons, in the country, who knew nothing of the larger organizations until they fell in with them here along the South Platte. Furthermore, the first overland stage line was making its occasional trips between the Missouri river and Salt Lake, by way of Fort Laramie, and at longer intervals a wagon train would pass this way on a journey between New Mexico and Utah, or by the Arkansas river route to and from the Missouri river. There were also a few traders and trappers still coming and going, probably as much from force of habit as for any great amount of business in their lines that was then left for them to do. So, our parties of gold-seekers whose steps we have been following, were not entirely alone in the country.

The departure from the Missouri border of these two large companies bound for the alleged "new gold regions" was soon noised abroad. Wildly exaggerated reports of what was going on out at the base of the mountains were again in circulation that spring and summer along the Missouri and through the States, and led to the organization of many other parties in the border towns to follow these pioneers. While no authentic accounts of gold having been found in paying quantities went with them, these fantastic stories grew in size and splendor as they traveled. A repetition of similar circumstances, growing out of the Klondyke discoveries, occurred through the winter of 1897-98. Ample compensation for the lack of actual knowledge was found in fertile imaginations, just as readily in these earlier times as it was in the more recent excitement.

CHAPTER XX.

GOLD-SEEKERS AND IMMIGRANTS OF 1858—DISMEMBERMENT OF THE RUSSELL PARTY—SUBSEQUENT OPERATIONS OF THOSE WHO REMAINED—PLACER CAMP—MOVEMENTS OF THE LAWRENCE PARTY AND FOUNDING OF "MONTANA CITY"—O'DONNELL'S COMPANY AND "EL PASO"—CIRCUMSTANCES LEADING TO THE BEGINNING OF DENVER—FIRST BUILDING—AUTUMN IMMIGRANTS OF 1858—PIONEER BUSINESS MEN—THE LEAVENWORTH PARTY—ADVENT OF GEORGE A. JACKSON—OTHER SETTLEMENTS IN THE PIKE'S PEAK COUNTRY.

The pilgrimage of Russell and his men to Cherry creek had been a long and tedious one covering the period from February 17th to June 24th, when camp was made on the site of Denver. But, as the reader will have seen, the party moved leisurely; and, furthermore, the march across the plains was made somewhat difficult by conditions arising from the severity of the preceding winter, which was followed by a "late" spring.

These people did not tarry long here, for the morning after their arrival they broke camp, crossed the Platte river, and moved over to Clear creek, crossing it just below the mountains, and then went on to Ralston creek where they made camp. They remained there only a day or two, prospecting in the vicinity of their camp with but little encouragement, and then came back here, crossed the Platte, and again went into camp on the west side of Cherry creek.

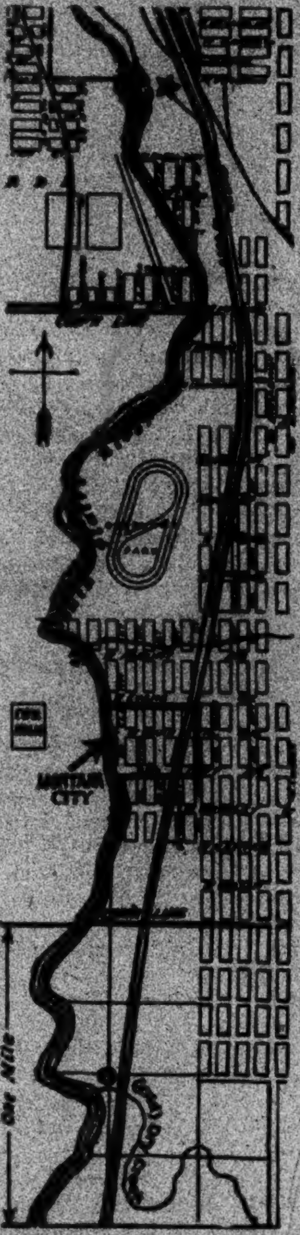
Before the party left Ralston creek the Indian members began to give signs of waning enthusiasm, and were not proving themselves possessed of the industry, patience, and hopefulness essential to successful gold-hunters, and which are usually the traits of the unsuccessful ones. So, in the evening of June 28th, in camp here, Beck and his Indians announced their intention to start back home the next day, and several of the white men, including four of the original Georgia party, said they were ready to go, too. These malcontents were thoroughly disillusioned of the charms of fortune-hunting in the "Pike's Peak gold-fields," even though they had not put in ten days at it, all told.

The Cherokees were the more completely discouraged, and most of them were homesick. They had also conceived that there was going to be trouble for all the party with the Indians of these parts, and were determined to leave forthwith. The discontented white members of the party had made up their minds that there was nothing in the mining business in this region, and that all of them had come out on a fool's errand. Russell and several others pleaded with the discouraged element not to break up the party, but to stay a while longer, pointing out that but little prospecting had been done, that they had found proof that gold was here, and that further search would certainly reveal it in paying quantities. But the Cherokee mind was made up to go, and neither eloquence nor hopeful persuasion could change it. The Indians started on their homeward journey at noon the next day, and with them went the discouraged white men including Lewis Ralston, William Anderson, Joseph McAfee and John Hampton of the original Georgia party, leaving W. Green Russell and twelve others, all white men, to search for gold as long as they wanted to. This was the last of the Cherokees in the events associated with the pioneer history of Denver. It is to be hoped that they safely reached their homes and lived content and happy long after.

T. C. Dickson also left the Russell party at this time and started with the others toward the Arkansas river. While on the way, below Pike's Peak, he heard of the Lawrence men. He then left the homeward-bound, hunted up the others, and joined them at their camp at the Peak the day after they stopped there.

Those who stayed with Russell and were determined to still further prospect the country were his two brothers, Levi and Oliver, Samuel Bates, and Solomon Roe, of the original Georgia party; and Jacob Masterson, William McFadding, William McKimmons, James H. Pierce, R. J. Pierce, Valarious Young, Luke Tierney, and Theodore Herring, who had joined the expedition in Kansas. W. Green Russell had come to this country with the intention, to carefully prospect the eastern base of the mountains from Pike's Peak to the Black Hills, if necessary, and had especially in view the headwaters of the South Platte and its mountain tributaries. Therefore, he and his remaining associates, undismayed by the desertion of the larger part of the company, immediately resumed prospecting, turning their attention to Cherry creek and the River Platte.

Not much time was spent on the creek, but it was rather carefully examined by some members of the company from its mouth up to about the point where Broadway now crosses it. It is described as having been at that time a shallow trough, dry, about one hundred yards in ranging width, and with banks from two to three feet high. This is still its normal general appearance, excepting here in the city where its channel has been artificially narrowed and made to appear deeper in some places by its banks having been raised. A little gold was found in the creek, but not much more than was obtained by Captain Marcy's teamster, who was the first discoverer of the yellow metal in the bed of that historic and occasional water-way.



The Russell Party's "Diggings" on the Platte.

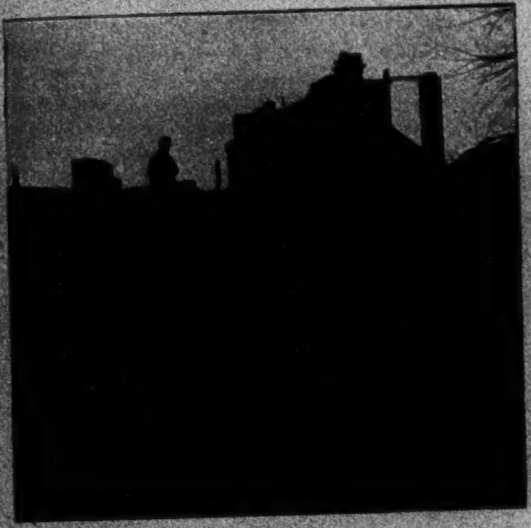
(Star near top of map, "old Mexican Diggings"; cross at middle of map, mouth of old "Little Dry creek"; circle near bottom of map, locality of "Placer Camp." Site of "Montana City" is indicated near middle of map.)

On the day after the weary and homesick departed, W. Green Russell and most of his party moved up the east side of the Platte to the locality later reputed to have been where Smith and his alleged Mexican associates were afterward said to have found gold in 1857. The rest of the party soon followed and all of them engaged in the hunt in that locality. A camp was established there and mining begun, the first day's work yielding between five and six dollars' worth of dust. In subsequent operations when better appliances had been contrived they took out as much as ten dollars' worth a day.

But this place soon appeared to be exhausted and the men moved farther up that side of the Platte to the mouth of a small creek, then almost without water, and which became known as Little Dry creek, but is now nameless. There they worked a day or so with indifferent results, but found some gold. Then they moved still farther up the river to the mouth of a larger creek which, also, was almost waterless, and which was afterward named Dry creek, but now appears on some maps as Little Dry creek. They began prospecting in its bed, and one evening, at a point a short distance from its mouth, the presence of more gold than they had yet seen in one place anywhere in this region rewarded their labors and enlivened their hopes. At this place they at once established their camp. They dug large holes in the wet sand, put their rockers down in them, shoveled in some of the dirt and, dipping in the water that seeped into the pits, soon washed out more gold than they had found in all their other prospecting since they had been in the country. This was the most important and valuable discovery made that year in all this region, though the party, all told, recovered only several hundred dollars' worth of dust, during their operations there.

Inasmuch as many hitherto published accounts of the locations of these pioneer "gold-diggings," have placed them at various points on both banks of the South Platte river, from three to six miles above the mouth of Cherry creek, it is essential that their localities should be definitely stated. They are all on the eastward side of the river, are places of great historic interest and should be marked by permanent monuments. The area of the "old Spanish," or "Mexican diggings," where the early reports among Denver's pioneers stated that Trader John S. Smith and his Mexicans discovered and washed out placer gold in 1857, is within the city limits, embracing all told a tract of a couple of acres. But the scene of the Russell men's operations includes only a small part of it, and is on the river bank, on the south side of Virginia Avenue, between that avenue and the old Bailey, or Tabor, smelter and almost within the shadow of the latter. The land around there is platted, but to the eastward of the diggings it is mostly occupied by railway tracks, with the "roundhouse" and other buildings of the Santa Fe road near by. Virginia Avenue is supposed to extend down to the river, and near its foot are the headgates of the ditch supplying Lake Archer, the gates being but a few yards distant from the diggings; the excavations still being apparent. Virginia avenue is two and one-quarter miles south of the Capitol Building.

The small creek, an insignificant water-way even in watery times, which the Russell men, and others in the autumn of 1858, called Little Dry creek, puts into the Platte just south of Jewell Avenue which is the south line of the Overland Park property. This little stream, on which the Russells found some gold, is also within the city limits. One and one-quarter miles south of Jewell Avenue, and a half-mile south of the present southern limits of the city, another and larger stream empties into the Platte. This is the Dry creek on which the Russells' Placer Camp was located in the summer of 1858; and the later town of "Montana" was a mile north of it. On some recent maps this "Dry creek" appears as "Little Dry creek;" and another stream, one mile north of Littleton, is named "Dry creek"—a shifting of the pioneer names.



Present Aspect of the "Old Mexican Diggings."
Figures in middle foreground are those of William N. Byers and Andrew Sagendorf, who mined there in 1859.
(From a photograph made in 1900.)

While the Russell people were working at Dry creek a party of men on their way from Utah to Westport, Missouri, (Kansas City), diverging from the common route from Fort Laramie to the Missouri, came down along the base of the foot-hills in this direction. While encamped near the mouth of Ralston creek they, too, found a little gold in the bed of that stream. One of the number, a man named Cantrell, visited the Dry creek diggings and obtained a sack of the dirt in which the miners were working there. This was taken to Westport, where it was carefully washed out by an old California miner named Ira Evans and, for its quantity, yielded a fair amount of gold. This result was made public at Westport and, growing bigger all the time, it went up and down the Missouri river, in company with many other new stories about the Pike's Peak country, that were making plenty of extravagant talk in all the towns along the border through that autumn of 1858.

The Dry creek diggings were named "Placer Camp" by the Russell people, and the place was the first in this immediate vicinity to receive a definite name. However, after the middle of July, the work had ceased to be mining and became somewhat lean prospecting. Six of the party went over into the mountains and penetrated the South Park. Running short of supplies, they found what it was to live on game served without salt; but that was all they found, for no gold was discovered in the Park at that time.

Early in August, the South Park prospectors having returned and the others having grown weary of their operations around Placer Camp, it was decided to strike out for the north. The party proceeded along the base of the mountains, almost fruitlessly prospecting all the way; and on September 4th camped near where the Medicine Bow mountains join the main range, and just within what is now southern Wyoming. Dr. Russell says—

> "That night snow began falling, and continued all next day. Realizing that we were too far north, we started on our return journey to the Platte and reached our old camp [Placer Camp] about the middle of the month."

Upon their arrival they concluded that they could not continue their prospecting with any degree of success in what they believed was fast-approaching winter weather, and it was decided to at once establish winter quarters, and await the following spring before resuming their work. It was in consequence of that conclusion that the first habitation by and for white men was constructed on the site of Denver, as will presently be shown.

At this time W. Green Russell and J. O. Russell decided to go back to Georgia, organize a new and larger company to come out in the spring with new outfits and an abundant supply of provisions for the next summer. The leader was convinced that rich deposits of gold existed here somewhere, and that they could and would be found. So, about October 1st he and his brother set out on horseback on their long journey across the plains. Down on the Arkansas river they met a party on the way hither which was destined to make a commotion at the mouth of Cherry creek upon its arrival—the party of "Leavenworth men," the organizers of the "Denver City" Town Company. W. G. Russell and his brother returned in the spring of 1859 with a small regiment of Georgians, and made some important discoveries, the circumstances of which will be related hereafter.

Through that summer of 1858 an occasional trader, or a mountainman, passed through here, and once in a while a party of the restless "emigrants" of the period, to or from Salt Lake City. Of the latter class were S. M. Rooker, his wife and daughter, and son John. They arrived at Cherry creek on August 30, 1858, and went up to the Dry creek diggings where they remained until the middle of October, when they came back here and camped on the west side of the creek. They were a non-polygamous Mormon family which had left Salt Lake to return to the States overland. After crossing the mountains by way of the South Pass the came down this way. Mrs. Rooker and her daughter were the first white women among the pioneers on the site of Denver.

Present Aspect at mouth of old "Little Dry creek."
(Photographed in 1900.)

It is now time that we give further consideration to the experience and fortunes of the second organized party that crossed the plains to hunt for gold in the Pike's Peak region; the company organized in the spring of 1858 at Lawrence, Kansas, by John Easter, and which we left encamped at Pike's Peak. Mr. Easter still survives, a hale and hearty man, and is now a citizen of Goldfield, in the Cripple Creek district. To him we are indebted for verification of many facts and circumstantial incidents connected with the organization, progress and operations of the Lawrence company, of which he was the promoter.

The Lawrence men, as gold-hunters, seem not much better than the Cherokees, when the practical results of their operations are considered; although they tried hard enough. However, they had the staying qualities in which, as we have seen, our Cherokee friends were so lamentably lacking; and these served them to good advantage in other but later undertakings. When they hauled up in the shadow of Pike's Peak they camped near a little stream and began prospecting in the neighborhood. They put in a week or ten days at resultless work of that kind. Then the rains descended, the floods came, and the innocent-looking little creek became a torrent and drowned them out of their camp. Having been joined by T. C. Dickson they moved over into the Garden of the Gods, and after staying there a few days concluded that they would go farther south to see if they could not find gold in that direction. They prospected along the way and went southward nearly to the Sangre De Christo pass, but found nothing. Here they fell in with a mountain-man who told them of Russell's discoveries up on Dry creek. After sending across to Fort Garland to get some reinforcements for their larders, they turned around and started for the South Platte river. They prospected along that stream, but with no better results than they had had at and below Pike's Peak; and finally pulled into Placer Camp on the 4th of September, finding the place practically deserted. It may be said here that while the Placer Camp locality never further developed as a mining point of much importance, it was a place of absorbing interest to the newcomers in the autumn of that year. Many men toiled there in the spring of 1859, but the results were not of great consequence.

Some of the Lawrence men immediately began hunting along the creek and the Platte for working places that might yield something, but with most indifferent success in the weeks they devoted to it. Others, believing that the Placer Camp diggings would prove permanent, or near enough so to give a settlement a good start, decided to lay out a town near there. They organized a company, elected Josiah Hinman, President, and William J. Boyer, Secretary. The other members joined heartily in the enterprise, and by the middle of September the deed was done. They laid out their town and gave it the pretty and appropriate name of "Montana City." While "Montana" did not survive many months, it was the first collection of white men's dwellings in all this Colorado region along the eastern base of the Rocky Mountains. Fifteen or twenty cabins were built there that fall, in regular rows fronting on streets in orderly town fashion. However, "Montana's" career was cut short, and in less than twelve months not a vestige of the hamlet remained. The causes resulting in this unmerited fate will present themselves further along in this story. This first town in the Pike's Peak country was located on the eastward bank of the South Platte river, and its site is now within the city limits of Denver. The land on which it was situated is bounded on the north by West Evans Avenue; on the east by South Tremont street; on the south by West Iliff Avenue; and on the west by the Platte river. The tracks of the Denver & Rio Grande and the Santa Fe railroads cut through the eastern side of the tract. The place is directly east of the Overland Cotton Mills, and four and one-quarter miles down Broadway from the Capitol Building. A few new houses are now on the land, and in several places shallow prospect holes remain to indicate where the founders of "Montana" hunted for gold. William J. Boyer, of the Lawrence party, later "took up" the "Montana" town-site and other land around it, for a ranche, and in 1861 sold it to General Ewing for $750. Boyer is now living near Pony, Montana.

Some of the Lawrence men in their industrious burrowing in the vicinity had accumulated a little gold dust. Having left home with the intention of returning in the autumn, several of them started back to eastern Kansas early in October. Notwithstanding the bald fact that the general results of their expedition had been disappointing, when they got to Lawrence, ragged and unkempt from the wear and tear of their season's experience, they were heavily laden with fascinating stories of what they had seen and found in the west. Those who had a little gold exhibited it with pride, and the sight of the shining grains of metal made the beholders believe that the returned miners probably had much more in concealment about their persons. Most of these men expressed their intention to go back to the mountains early the next spring, and this, with the sight of the bit of South Platte gold-dust, made many of their friends and neighbors determined to do likewise.

The Lawrence party did not develop any conspicuously successful miners in that year of 1858. As an aggregation the company seems to have taken more readily to the business of locating towns than to the heavy drudgery of prospecting, and further evidence of this will be found in the accounts of subsequent operations by some of them at the mouth of Cherry creek soon after "Montana" was brought into being.

Following the Lawrence company across the plains and not far behind it, was another party from eastern Kansas headed by a man named O'Donnell. These men appear to have come to the country more with the intention of becoming settlers, in the ordinary meaning of the term, than to engage in gold mining. They headed in to Pike's Peak, and after they got there laid out—mostly on paper—a town on part of what is now the site of Colorado Springs. From its location at the gateway to the Ute pass through the mountains, they named it El Paso. The paper part of this enterprise was accomplished before "Montana" became a reality, but, as "El Paso" never developed anything more than one poor log cabin and a few tents, it did not disturb "Montana's" title to having been the first real town in the region. Some of these men took up land claims on the Fontaine-qui-Bouille just above "El Paso," which are now included in the site of Colorado City. A number of town lots were assigned to the members of the town company, and several were sold, or were pretended to have been sold; but "El Paso" languished and the next year gave way to Colorado City, then founded near by.

Early in September, 1858, several companies of men left the Missouri river for the Pike's Peak country, and before that month had closed several more had started. All were not intending to hunt and dig for gold, as there were merchants, mechanics, professional men, town organizers, and general adventurers among them. But all were led on by the exaggerated stories afloat along the Missouri, but which had no more foundation in fact than could reasonably be derived from what has been narrated in this and the next preceding chapter; but the oncomers did not know this. The great majority were headed for Cherry Creek, a result of the stories that had arisen from Russell's midsummer operations at Placer Camp; but some of them had, under the advice of frontiersmen, decided upon other localities as the scenes of their operations.

Immediately after the Russell company returned from the northern prospecting expedition, and before W. G. and J. O. Russell started on their journey back to Georgia, it was agreed, as we have stated, that the other members should establish winter quarters in this vicinity and remain here through the ensuing winter. In addition to building a house it was part of the plan that, as provisions on hand were insufficient to carry the men through the winter, Dr. L. J. Russell and two or three others should proceed to Fort Garland and obtain a fresh supply, while those left behind should put up a cabin at some point to be agreed upon. At this time the party was at Placer Camp. Dr. Russell decided that the winter quarters should be built at the mouth of Cherry creek instead of at Placer Camp or at "Montana," and pointed out that a permanent settlement would probably arise somewhere near, in the following year, and if so that the mouth of the creek would be the better place for a town. While these arrangements were being made, the old plainsman and trader, John Smith—or John Simpson Smith, as he later called himself—already introduced to the reader, visited the camp of the Russell people. This was their first encounter with him, though they had heard that he and another trader named William McGaa, afterward known as "Jack Jones," had been camped down the Platte near old Fort St. Vrain; but they did not see McGaa until late in October, at the mouth of Cherry creek after several parties of autumn emigrants had arrived here. Smith made friendly overtures to the Georgians and an alliance with them, notwithstanding that he had already made another, as we shall presently see, with certain of the Lawrence men then at "Montana" about a mile distant from Placer Camp; but of this he said nothing to the Georgians.

Toward the close of September Dr. Russell, R. J. Pierce, William McFadding and William McKimmons, with two wagons and teams set out for Fort Garland for supplies; and a few days later W. G. and J. O. Russell departed for Georgia. Their associates left at Placer Camp had been instructed to remove to the mouth of Cherry creek to put up winter quarters as directed by Dr. Russell. Trader John Smith had invited himself to spend the winter with the Georgians and proposed that they unite and put up a double cabin, one part of which he and his squaw and goods would occupy; an arrangement which was indorsed by W. G. Russell before his departure, as Smith was an experienced man in the west, on good terms with the Indians, and had agreed to contribute some goods of which the Georgians were in need.

Mouth of old "Dry Creek." "Placer Camp" was in timber in left of the picture.
(Photographed in 1900.)

So, Smith and "the Russell boys," as he called them, a day or two later moved to the mouth of Cherry creek, though when they did so there was not a Russell left in the company. They lost no time in beginning the double cabin which, as near as its site can now be located, was built but a few feet from the present northeast corner of Eleventh and Wewatta streets, with its rear toward the river. The men crossed the Platte to cut the logs, which they "snaked" over. The cabin was a rough affair, of good size and with a shed roof covered with earth. Concerning it and some other matters, Dr. Russell says:

"When I got back from Fort Garland—having gone on ahead of the others—past the middle of October, I found the cabin finished except the chimneys, and occupied by the builders, with some Arapahoe Indians camped near by. The boys told me that out of respect to Mrs. Wa-po-la Smith, the Smith end of it was finished first. They also said that our friend Smith had contrived to avoid most of the hard work in building. I also found that during my absence a considerable party headed by D. C. Oakes had come up the Platte from Omaha and joined our new camp. Other parties soon came in, among them being Henry Allen, William Slaughter and—I think—Andrew Sagendorf. Upon my return our double cabin was the only structure on either side of Cherry creek, and no other was begun until we started in to organize a town company, which we did in a few days."

We will leave the history of the organization of town companies to appear in succeeding chapters, and will consider here what immediately followed Dr. Russell's decision to build the winter quarters of his party at the mouth of Cherry creek.

The company he mentions as having arrived here during his absence—that led by D. C. Oakes—came in on October 10th, and was the first significant and important party to reach here that autumn. Beside the leader, it included H. J. Graham, Charles Miles, George Pancoast and Abram Walrod. Major Oakes was from Glenwood, Mills county, Iowa, and the others were also Iowa men. They came by way of the Platte river route and upon their arrival, about the first thing they did after they went into camp on the west side of the creek, was to put out on a visit to Russell's Placer Camp. The coming of these forceful, energetic men at that season of the year meant that they had come to stay, and brought into existence a conviction that there was really going to be a permanent settlement made here at the base of the Rocky Mountains.

On October 20th, the second party arrived, coming also by the route up the Platte. It was from Omaha, and included Hayman Chapman, Judson H. Dudley, A. J. Smith, and Henry Springer. This party was followed on the 24th by a large caravan—a consolidation of several original companies—accompanied by one woman and fifty-six men. These people came from Missouri, eastern Kansas and southeastern Nebraska, having consolidated their forces at Fort Kearney, and proceeding west from there by the Platte river way. Among them were John Anthony, A. H. Barker, "Hank" Bassett, George A. Bates, George Colvin, William Dermitt, Eli Dickerson, Miles Fellows, "French Louie," —— Garrison, William Gullion, David Griffith, George Griffith, Captain Harrington, D. Hooper, Joseph Hoover, Bart Kennedy, Fred Koocherhautz, William Liston, "Count" Murat and his wife, Jervis Richardson, George Salsey, Andrew Slane, William M. Slaughter, Ransom Smith and William Stocking. A portion of this company went to "Montana" and temporarily settled there, while the remainder stayed here.

On October 26th a small party headed by E. P. Stout came in by way of the Platte. Mr. Stout, who soon became a leader in other things, has contributed the following account of his experiences here on the first day and evening:

"Our party, consisting of myself and two others, with a four-horse team, left Omaha on the 26th day of September, 1858, and arrived at the mouth of Cherry creek on the 26th day of October. We were met by "Jack Jones" and John Smith, traders with the Cheyenne and Arapahoe Indians, who were living on the site of Denver. That evening these two traders invited us to visit them and feast with them. We did so, and were treated to a good meal provided by Jones' squaw "wife." It wound up with a hot whiskey stew made from whiskey distilled from wheat, and called "Taos lightning." From the effect it produced on Jones and Smith, one would readily have concluded that it was a genuine article of fighting whiskey. When it began to take effect those two gentlemen seemed to be seized with a fiendish desire to slaughter one another; and with their Colt's revolvers commenced a rapid fusillade upon each other. As that kind of entertainment was rather too vigorous for us "tender-feet," we managed to slide out through the darkness, making our way to our own tents, leaving our hosts to the tender mercies of each other, and expecting to find next morning both of them riddled with bullets. On the contrary, before the sun was fairly up both of these gentlemen came over to our tents to apologize in the most humble and contrite manner for the disgraceful and humiliating spectacle they had made of themselves before their invited guests. We came to the conclusion that it had been merely an effort on their part to impress us innocents abroad with their wonderful bravery."

In the last week of that October, and through November several parties, but none so large as the third one, above-mentioned, arrived and at once established themselves on the west side of the creek where, up to the middle of November, nearly all the people who had then put in here had congregated, and where there was by that time a camp of considerable size. Among the men who came with one of the parties late in October, was Henry Allen who was a civil engineer and a man of energy and executive ability. He quickly became identified with the enterprises which resulted in the organization of town companies and the platting of towns. On December 1st the second large party from Lawrence, Kansas, arrived. It numbered about thirty, but its members are not to be confused with the pioneers from that town, who historically figured as the "Lawrence men."

The names of all who came here through that autumn can not now be certainly ascertained, but aside from those elsewhere mentioned were M. A. Avery, P. T. Bassett, Richard Blore, Anthony Bott, William Coberly, James Cochrane, Charles Dahler, Captain William Green, Louis Hermans, M. Ivory, James Luttrell, A. Monti, Arthur E. Pierce, John J. Riethmann, L. J. Riethmann, Henry Reitze, Andrew Sagendorf, J. S. Sanders, George C. Schleier, John Scudder, Henry Springer, Charles M. Steinberger, F. B. Steinberger, John Sutton, Oscar Totten, D. R. Wagstaff, O. P. Wiggins, Robert Willis, and E. A. Willoughby. Under the circumstances then existing, it is not to be expected that the name of each individual could have been made of record. There had also been a few business enterprises established. On October 27th, Blake and Williams, the pioneer merchants, arrived with a considerable stock of mining-camp merchandise. A week later, John Kinna came in with a small stock of hardware and tinner's goods. Early in December, J. D. Ramage, a repairer of watches, opened a shop; and a little later was followed by R. L. Wooton with a stock of merchandise, containing certain elements which, in the generous hands of "Uncle Dick," made Christmas day one that was long and longingly remembered. Inasmuch as these and other pioneer business enterprises will be considered in detail hereafter, we will not here enter into further particulars concerning them.

Site of "Montana City."
(Photographed in 1900.)

While all these things were happening, the organizers and platters of towns had not been idle. Several embryo metropoles had come into being, principally on paper, however, and one of them had suffered the experience of our old friend Jonah with the whale, but with the important and fatal difference that it did not survive the adventure. "St. Charles" City had risen and fallen; and Auraria City and Denver City had arrayed themselves to their best advantage on the banks of Cherry creek, with greater zeal and larger ambitions than the circumstances of those times would seem to have warranted.

It is to be remembered, here, that all of the Cherry creek pioneers were not town-builders, nor financially interested prospectively in town-platting, though most of them identified themselves with one town or the other, as we shall see. Many were abroad looking for gold, for the autumn was fair and favorable, and even the following winter proved gentle in its attitude toward these courageous men seeking their fortunes in a new and wild country.

In 1858, James W. Denver, of Ohio, was Governor of the Territory of Kansas—an able and sagacious man. The reports from the western end of the domain under his jurisdiction had immediately commanded his attention, and when the movement of energetic, enthusiastic men to the reputed new gold fields began that year, he comprehended its significance, and seems to have foreseen its ultimate consequences. By midsummer he had in mind the creation of a new Territory from the domain of western Kansas, which he proposed should be called "Shoshone," after the great family of western Indians. Late in that summer, a small party was organized at Lecompton to go to Pike's Peak, and among its members were Hickory Rogers, H. P. A. Smith, and E. W. Wyncoop, men whom he knew well and favorably. The Governor, in all probability misled by the many overgrown rumors then flying around over the border, and in consequence of them over-estimating the number of people who would be here that year, concluded that he would immediately commission three "county officers" to proceed to the new country as representatives of civil government under the jurisdiction of Kansas Territory. The western end of the Territory had, in 1855, been set off as "Arapahoe county," but no permanent county organization had ever been established in it. Of the circumstances of Arapahoe county's creation in 1855, of the officers appointed by its organic act, of an election held in 1856, and of other particulars related to the origin of the county a full account will be found in a subsequent chapter dealing with its general history. Governor Denver appointed H. P. A. Smith, Probate Judge; Hickory Rogers, Chairman of the County Board of Supervisors; and E. W. Wyncoop, Sheriff. Armed with their credentials of office, these "county officials" set out with their party for the west.

While this was going on another Pike's Peak company was being organized at Leavenworth—its members becoming famed in our pioneer local annals as "the men from Leavenworth." In this party were Folsom Dorsett, M. M. Jewett, General William Larimer and his son William H. H. Larimer, C. A. Lawrence, and Richard E. Whitsitt—men who became actively and intimately associated with the founding and history of Denver. This company left Leavenworth on the 3d of October, a few days after the departure of the official party from Lecompton, both going by way of the Arkansas river route.

Before reaching Fort Bent, the Larimer company encountered W. Green and J. O. Russell who had left Placer Camp, as we have stated, for their homes in Georgia; and from them learned definitely of what had been done on the South Platte that season, and that they intended to return the next spring and bring a large delegation from Georgia with them. When the Leavenworth men reached Fontaine City—"the Pueblo"—they found the Lecompton pilgrims there, they having arrived just in advance of the others. From Fontaine City, which had then just come into being, the two companies came up to Cherry creek together, arriving here on the 16th of November, and going into camp in Auraria City.

The men composing this combined party were destined to exert much influence over the fortunes of the settlement at Cherry creek, not only in that year, but also in those that followed. The pioneers of Denver were, as a rule, men of uncommon force of character and determination of purpose, and these from Leavenworth were conspicuously so. They lost no time in demonstrating it, nor did they let the grass grow under their feet—if it had been disposed to grow at that season of the year—while they stood around talking about what they were going to do.

Individuals and small groups had been drifting in from various directions, adding to the prospective aggregate of winter sojourners, and strengthening the conviction of the pioneer town-builders that they had wisely selected the sites of their "cities." Pike's Peak had been discarded as the local focus for in-coming fortune-seekers, and "Cherry Creek," now raised to the dignity of a definite settlement, was substituted for it; the Peak remaining as the popular landmark for the general region hereabouts. No new "diggings" of the least importance had been opened by any of the newcomers, and Placer Camp had ceased to be an active mining center; yet, the fanciful stories told of what the Russells had done there had great potency in sustaining the hopes of those who had been here long enough to rank as pioneers—which did not call for much time, and in exciting the imaginations and anticipations of the more recently arrived people.

Several of the men—a dozen or two—who came out here in October, started back to the Missouri river before the close of November, intending to return in the spring with new and larger preparations for mining, merchandising and other fortune-winning enterprises they had in mind; but it was yet entirely a matter of faith in things to come, for all the gold that had been found in the entire region that year would not have paid the expense of moving an ox-team wagon-train from the Missouri river to Cherry creek. It was estimated that on the first of December there were between two hundred and fifty and three hundred people here, or scattered around in the immediate vicinity and within practical hailing distance.

While W. Green Russell and his remaining associates were prospecting far to the northward of Denver in September, a young man named George A. Jackson, whose name was destined to become historical in the annals of the Rocky Mountain region, was also in that part of the country, but it does not appear that he at that time fell in with the Georgians. Jackson was a native of Glasgow, Missouri, and went from that town to California after the discovery of gold in that country. He remained there until the spring of 1857 when he returned to his former home. Early in 1858 he crossed the plains with a small stock of goods for Indian trade and proceeded to Fort Laramie, intending to engage in bartering and prospecting along these mountains for a season.

D. C. Oakes (Deceased).
(From a photograph made about 1865.)

Of the circumstances of his presence in this part of the country Jackson afterward stated that late in the spring of 1858 he came down from Fort Laramie with a party conveying goods with which they intended to have trade with the Indians at the mouth of Cherry creek. There were in the party twenty-five Ogallala Sioux under chief Swift Bird, a brother-in-law of Antoine Janise, a French frontiersman; Chief Chaka, Swift Bird's lieutenant; John Gardner, Oliver Schofield, Antoine Le Beau, Nicholas Janise and his family—a Snake squaw and her children; Jose Merrival, a Mexican; and a half-breed boy. They came by way of Cheyenne Pass where they found a detachment of about two hundred and fifty United States troops engaged in building Fort Walbrach in the Pass, with some eight hundred Cheyenne Indians encamped around them. The party stopped there, traded off all their goods, and then went back to Fort Laramie for a new stock. On the return, when they got to where the old Santa Fe-Fort Laramie trail crossed the Cache-a-la-Poudre river—the site of the present village of La Porte—they found Ni Wot's band of Arapahoes and Big Mouth's band of Cheyennes encamped; about 500 Indians in all. Antoine Janise (in French "La Juennesse") and some other traders were also encamped there; and James Sanders, Chat Debray, and "Rocky" Thomas came up about the same time, the last-named three joining Jackson's party. The second stock of goods were soon disposed of to the Indians, after which Jackson and his three new associates began hunting for gold, as they moved down this way. Their only discovery of any consequence was made in what was then called the Benito Fork of St. Vrain creek. From there they continued their prospecting until they reached this locality, when they went to Placer Camp where they found W. Green Russell's party which had then returned from the prospecting journey to the northward. Jackson and his associates remained there a few days and then went over to Ralston creek in which they prospected and found a little gold. From Ralston they went back to Janise's camp on the Cache-a-la-Poudre, and from there returned to Fort Laramie.

About the first of December, after the "cities" had been begun here at the mouth of Cherry creek, Jackson returned and in company with James Sanders and Thomas Golden went over to the foothills and began prospecting in Clear creek, but beyond some promising traces, found nothing to reward their labors. They put up winter quarters on the site of the present town of Golden, and continued their prospecting operations up until the first of the new year, without much greater reward than the conviction in Jackson's mind that he was on the scent of gold. What they did after the new year came in makes another and important story by itself. Though their winter camp was established where Golden was, the next year, located and platted, it can hardly be called the beginning of that fine little city which, in 1859, was founded, and named for Tom Golden of Jackson's party. Jackson had no thought of founding a town when he set up his winter camp there.

The "town of Montana," not far from Placer Camp, and the "cities" at the mouth of Cherry creek were not the only settlements in the indefinitely defined "Pike's Peak country" in the latter part of 1858. We have already mentioned "El Paso" in the afternoon shadow of the Peak, and which, like "Montana," vanished from the face of the earth within a few months. But there was another one down that way that survived, though by name it long since disappeared from the map of Colorado.

In the autumn of 1858 a small party from St. Louis, consisting of George LeBaum, Josiah T. Smith, Otto Wenneke, and Frank Doris, came out by the Arkansas river route to the mouth of the Fontaine-qui-Bouille where they went into camp. In a few weeks they were joined by several straggling wayfarers, when it was decided to lay out a town. Two men named Wing and Cooper, who came from somewhere in Missouri, plodded in with their wagons loaded with a small stock of frontier merchandise. With them were two others, named Shaffer and Browne, and these men, having some knowledge of such business, were induced to make a survey and plat of the new town, which was called Fontaine City. The place soon received a number of other recruits, and before winter set in some thirty cabins were built of logs and adobe, the last-named material being taken from the crumbling walls of the old "Pueblo" which stood near by, and which Beckwourth, and others claimed to have built sixteen or eighteen years before. Wing and Cooper opened a store and built a large cattle corrall there.

It does not appear that the original founders of Fontaine City came out to hunt for gold; they were traders and otherwise men of business. Several of the Lawrence party went down there to stay through the winter of 1858-59. Among them were Robert Middleton with his wife and child; Mrs. Middleton being the first white woman in the place. Late in 1858 LeBaum, Smith and Doris came up to the mouth of Cherry creek and identified themselves with affairs here, becoming well-known and active men in Denver. Fontaine City, or "the Pueblo," as it was still often called, because of the old name of the fur-trading days, became an important way-point in succeeding years for the immigrants who came to Denver by the Arkansas river route. It was subsequently absorbed by the city of Pueblo, and is now nothing but a historical reminiscence.

First structure by white men on the site of Denver—the Russell-Smith double cabin.
(From an old drawing by Dr. L. J. Russell.)

A beginning was also made to the northward of Denver, in what is now Boulder county. About the middle of October a party from Nebraska City, having come out to this country by way of the Platte valley, arrived at Fort St. Vrain. It consisted of Thomas Aikins, his son, and a nephew; Albert Atchison, A. A. Brookfield, John Brown, Silas D. Burns, H. Childs, Charles Clouser, C. Davenport, W. Dickson, David Gordon and his brother, John Hall, Thaddeus Hamilton, W. W. Jones, Thomas Lorton, J. W. McChesney, John Rothrock, Theodore Squires, the two Wheelock brothers, A. K. Yount, and several of whose names there is no record. On October 17th Aikins and his two young relatives; Brookfield, Clouser, Dickson, the two Gordons, Lorton, Moore, Rothrock, Squires, the two Wheelocks, and Captain Yount passed over into the Boulder valley and on that day established their camp at Red Rock near the entrance to Boulder canon and but a short distance above the site of the present city of Boulder. The other members of the company with their wagons and outfit came on to Cherry creek from Fort St. Vrain and cast their fortunes with the little settlement here. The Red Rock camp did not receive any definite name that year, but it was in one sense the nucleus from which the town of Boulder grew in 1859.

The men at Red Rock were gold hunters, and good ones, too. Several of the discoveries made in that section in the following winter were the work of the Red Rock party. The first thing they did was to build a group of log houses for winter shelter, and after they were finished the camp was sometimes referred to as "the Eleven Cabins." That was a mild winter, and the weather permitted much prospecting to be done.

In the summer of 1844, Antoine Janise, the French trapper, first visited the Poudre valley and was so pleased with its beauty that he determined to locate there should the country ever become settled by white people. In the summer and autumn of 1858 he was there again, with his Indian associates, as we have mentioned, and after having learned of the presence of gold-seekers in the country and of the coming of emigrants, he resolved to establish a town on the Poudre river; and after having been joined by Elbridge Gerry and Nicholas Janise, obtained the consent of an Arapahoe band of Indians whose chief was Bald Wolf and who were then in the Poudre valley, to their settlement there. Through the winter of 1858-59 a considerable number of traders and prospectors had assembled there and among them a town company was formed. Its members were Antoine and Nicholas Janise, Gerry, Todd, Randall, Raymond, John Batiste, Oliver Morisette, Antoine Le Beau, Goodwin, Ravofire and others. A town was located and named Colona, and some thirty or forty cabins built. The place afterward became the present village of Laporte, near Fort Collins. Gerry's connection with the town was speculative, as he did not locate there; nor did his speculation amount to much.

Winter was now at hand for our Denver pioneers, and those who had come to make the best of things at Cherry creek and learn by practical experience what a Rocky Mountain winter would be, had busied themselves in the closing autumn putting up cabins and making them as comfortable as possible against the frost and winds and snows. A favorite pastime with many, through the cold and house-bound days that later occasionally came upon them, was writing letters—to be dispatched however and whenever they might—to friends in the east. These missives were filled with accounts of the region's richness in gold; a metal which, except in very small quantities representing large labor and plenty of it, they had seen but with the eye of faith.

The newspapers in the States took up the refrain early in that winter and gave circulation to almost every sort of exaggerated versions of reports and rumors from the west. Among these, that of the "Westport sack of gold" proudly held its head aloft. The newspapers of the Missouri river towns were great offenders in this way at that time. They embellished their narratives with all the colors of the rainbow, and rather obtrusively presented the alleged advantages of their respective "cities" as outfitting points for emigrants. Each of these "cities" was far better prepared than any other to supply horses, cattle, wagons, provisions and tools to all who had enough energy and ambition to go to the Rocky Mountains and shovel out a fortune.

CHAPTER XXI.

Organized Beginnings of Denver—Pioneer "St. Charles Town Association"—Operations of Its Promoters—Story of the "St. Charles" Record—First Appearance of "Arapahoe County" in Local Annals—Town Companies "Squatters" on Indian Land—Organization of the Auraria City Town Company—Its "Constitution"—List of Its Shareholders—Surveying the Town, and Details Incident Thereto—First Lot-Donations—Home-Made Currency—Genesis of the Town's Name.

It is to be considered that the ancient cities of Europe, and even the American cities of the Atlantic coast, have traditions that have grown venerable in the lapse of years. In those of the older countries moss and ivy still cling to walls and roofs which men of many centuries before had seen. Husbands, wives, children, sweethearts, councillors, soldiers, who have been dust and ashes hundreds of years, looked from those ancient windows, trod the floors of those halls and dwellings, and passed in and out through the aged portals. They loved in the still standing gardens; fought in the same highways; drunk from the same still existing cups. Streets, by-ways, corners, monuments, statues, are saturated with history, which the intelligent visitor can read almost as familiarly and easily as he can read the printed page. Abbeys, cathedrals, churches, obelisks, columns, sometimes would seem in their dotage to be as ancient as the hills and valleys that lie around them, and to be part of Nature's handiwork rather than of man's.

But, in this country, and particularly in this western empire, there are no such historic landmarks. Traces of ancient semi-civilization there are, it is true, but they are of a time so far away, that they may be likened to the faint murmur of voices one hears in sleep. The difference between the rise and growth of other cities of the world, and the rise and growth of such a city as Denver, is almost as great as that between the many-ringed oak of the forest, that outlives generations of men, and the shooting up of a shade-tree that was a sapling yesterday, and in a few years will have all the proportions, beauty and usefulness of the forest's patriarch.

The explorers and pioneers, and those who followed them on hastening feet into this land of the west, made their history as swiftly as they built their city; and the annals of the world are searched in vain for anything to compare with either the one or the other.. Here a great city has been built within the period of active life of men not yet grown old.

It has frequently been stated that a large portion, if not a majority, of Denver's pioneers who were here at the mouth of Cherry creek in the autumn of 1858, were Georgia men. This, as we have seen, was not so. There were but few Georgia men here at that time. W. Green Russell's small party was the only one which came from that state in 1858. Nearly all the founders of the pioneer towns which were afterward united and became the city of Denver, were from along the Missouri river border; that is, they came hither from that general region.

When the ground on the west side of Cherry creek was made a camping place by the party of immigrants which came here October 10, 1858, that side was occupied as much because it just happened so, as by design. The double log cabin, or "shack," built by "the Russell boys" and Trader John Smith was then nearing completion; and so the first caravan that put in here in that month naturally made camp near them. Those arriving later pitched their tents where the others were, and so it was that the actual beginning of Denver was made on the northward end of the tongue of land lying between Cherry creek and the River Platte.

The possibility of a town at the mouth of Cherry creek had been talked about, but not very seriously, by "the Russell boys" and Trader John Smith before they left Placer Camp to locate here for the winter, and in disregard of "Montana" as a possible rival. But Smith never mentioned an association he had already formed with others to establish a town here, nor had any knowledge of such an enterprise otherwise come to "the Russell boys." At that time, a "town" always meant a "city" in the language of the west, and upon the arrival of the Oakes party it immediately became the subject of evening discussions around the camp-fires and at the evening parties held in the solitary double-cabin that constituted the nucleus for the camp.

But the first Cherry creek town company was not organized to lay out a town on that tongue of land. The primary purpose of all hands who were here in that autumn was to find gold, or to get it in some way after it had been found, and the exploiting of town lots was thought by some to be a promising way to do the latter. To an enterprise intended to be of this kind, the first one undertaken on the site of Denver, and with which Trader Smith was connected, we will now ask the reader's attention.

Adnah French (Deceased).
(From an ambrotype of 1857.)

Among the "Lawrence party" which founded the "City of Montana" were Frank M. Cobb, John A. Churchill, Adnah French, William Hartley, Charles Nichols and William M. Smith. These men deserted that town soon after it was brought into being, and came to the mouth of Cherry creek with a definite and immediate purpose in view—that of founding another "city." In this proposed enterprise they had been joined by T. C. Dickson, who had crossed the plains with the Russell party, but had, as we have told, gone down to Pike's Peak and joined the Lawrence men when the latter had arrived at that point. Dickson came with them to "Montana" and had remained there in the meantime. Most of the members of that Lawrence company would seem to have generally been more exalted by the spirit of real estate speculation than by that of gold digging; the inclination probably having been a legacy from experience or association with the dead mushroom "cities" that had recently flourished along the Missouri river border.

It was about five weeks after the Russell party had started on its prospecting expedition to the northward that these town-founders came to the mouth of Cherry creek, looked over the land, and decided to organize a company to lay out here and exploit a new town. At that time there was no one here at the mouth of the creek, all of the white people in this vicinity being congregated at "Montana." A few days later two white traders among the Indians, who had been camped down the Platte, near old Fort St. Vrain, put in an appearance at "Montana." They were John Simpson Smith and William McGaa. Both had Indian wives, and considerable influence among the Cheyenne and the Arapahoe Indians then occupying this part of the country. As title to all the land around here was then in the Indians, and not subject to occupation by white men under the public land laws of the United States, our party of town founders induced Smith and McGaa to join them in organizing the proposed town company, provided the two traders would make the enterprise satisfactory to the Indians; all of which they agreed to.

Smith and McGaa set up their tepees here at the mouth of the creek, and on September 24, 1858, their associates came from "Montana" to formally organize their town company. From the first, they had fixed upon the land on the eastward site of the creek as the site for their town and gave no consideration to any other. On that day they laid claim to and nominally took possession of a tract embracing six hundred and forty acres, lying eastward of the River Platte and Cherry creek; and then repaired to McGaa's lodge where they held their first meeting for organization. The following is a literal copy of the minutes of the proceedings of that meeting taken from the original record of the town company, the circumstances of the recovery of which together with some others connected with it, will presently be recounted:

Upper Waters of the South Platte River at the Mouth of Chery Creek Araaphobe County Kansas Territory.

September 24, 1858

This article of Agreement Witnesseth That T. C. Dickson, William McGaa John A. Churchill, William Smith William Hartley, Adnah French John S. Smith Frank M Cobb and Charles Nichols, have entered into the following agreement which they Bind themselves their heirs Administrators Executors, Assignees &c. forever to Well and truly Cary out the Same.———

Article First: Whereas, the aforesaid Parties, as above, have Agreed to lay out Six Hundred and Forty Acres of Land into Streets, Lots, Blocks &c to be held by them for Town purposies, and Equally divided among the Above members except Such Lots as the company Shall See proper to donate to Settlers, or for other purposies, and no Such donations Shall be made without the consent of Two thirds of the Members,———

Article Second: It is further agreed by the aforesaid parties to Locate the town on the East Side of Chery Creek, and to commence at a point about One Hundred and Sixty Rods from its mouth, more or less and running due East Three Hundred and twenty Rods thence north three hundred and Sixty Rods, thence due West three Hundred and Twenty Rods, thence South Three hundred and Twenty Rods to the Point of Starting."

Article Third: It is agreed by the aforesaid party that the expeses incured of Surveying Said town also for the procuring of a charter Books Maps &c and all necesary expences Shall be equaly borne by each member of the aforesaid company.

Article Fourth: it is further a greed by John S. Smith and William McGaa that they will take possession and hold for the benefit of the aforesaid

Company that fraction or quarter sectn as the case may bee lying West of the Town and Adjoining the Same and use their influence to see that it eventually becomes a part of the town and the common property of said Company at Government price the purchase money to be raised by the company———Signed and Sealed this Twenty fourth day of September Eighteen hundred and fifty Eight———

At this meeting of September 24th the following "constitution" of the "St. Charles Town Association," which had previously been prepared at "Montana," and which, as it appears here is also a literal copy, was adopted:

Constitution of the St. Charles Town Association.

We, the undersigned members have jointly agreed to lay out a Town at or near the mouth of Chery Creek and to be Equal Stockholders in the Same, and we have adopted the following Constitution by which the Town Company are to be governed—

Article First: Their Shall be a president, Vise President Secretary Treasurer and Recorder Who Shall be Elected by ballott at each anual meeting of the company and who together With four others of who air to be elected in the Same manner, Shall constitute a board of Diretors and they Shall hold their office for the tearm of one year, at the Expiration of which time a new Election Shall take plase, but provided that Said Election Shall go by default, then the aforesaid Officers Shall hold their positions untill the next anual Election

Article Second: In case of death Absence or Resignation of the aforesaid officers a majority of members may call a meeting and elect others in there place———

Article Third: It Shall be the duty of the President to preside over the meeting of the Bord to preserve order. likewise to Sign the Certifiates of Shares and to discharge the official duties devolving upon the president of meeting or of Companies———

Article Fourth: It shall be the duty of the Vice-president in case of absence death or Resignation of the President to discharge all the duties as above Required of the President———

Article Fifth: It shall be the duty of the Secretary to Keep the Books of the Town Company and to keep the proceedings of all the meetings and to report the Same at the next meeting it Shall be the duty of the Secretary likewise to sign the certificats of Shares

Article Sixth: It shall be the duty of the treasurer to take charge of Such Mony as the Board of Directors may place in his hands and to pay out the Same to order. which Shall be directed by the Board and Signed by the president and Secretary———

Article Seventh: It Shall be the duty of the Recorder to Record all mortgages. and all documents Relating to town lots and town property. and his fee Shall be fix by the Board of directors

Article Eigth: The Board of Trustees Shall consist of nine of the present Stockholders untill otherwise provided for by bye laws which they may hereafter adopt.

Article ninth: The first Election for officers of Said town company Shall take place on the Tweny-eigth Day of September Eighteen hundred and fifty Eight.———

this Constitution may be altered or amended at any time by a majority of the members.———

William M. Smith
William McGaa
John S. Smith

On September 28th the members of this close corporation again met at McGaa's lodge, and organised themselves. The entire party was made to constitute the Board of Trustees; and then Adnah French was elected President; William McGaa, Vice President; T. C. Dickson, Secretary; Frank M. Cobb, Recorder; and John S. Smith, Treasurer. Of these transactions the record says:

Sep the 28. 1858 At a meeting of the Town Company held in William McGaa lodg on the Platte The following persons was Elected To fill the offices as provided for by the Constitution

On motion Charles Nichols was called to the Chair and afterwards elected Chairman of The meeting. The meeting came to Order the members proceeded to ballott for the president of the Town company. on the first and Second ballott no one received a majority over All the rest but on the third ballott Adnah French received a majority and was Declared Elected President of the Town company. Then the members proceeded to ballott for the ballance of the officers which resulted as follows William McGaa Elected Vice President T. C. Dickson was Elected Secretary John S. Smith was Elected Treasurer Frank M. Cobb was Elected Recorder. The officers above mentioned together with four others which was William Hartley Charles Nichols William Smith John A Churchill was declared a Bord of Trustees.

On motion the meeting adjourned.

On October 2, 1858, these promoters held a meeting, but the record does not state where, at which they adopted some additional regulations:

Oct the 2. 1858 By laws of The St Charles Town Company

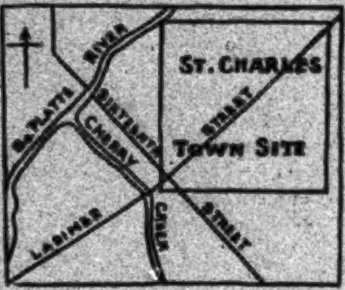
Article first

no person Can become a member of the St Charles Town Company unless his name Shall first be proposed by one of the member and at the next meeting The members of the town Company may go into an Election and if he Shall receive tw-third of the votes of the original nine members he Shall become a member of the St Charles Town Company in every respect except the right to cast his vote for or against an additional member

Article Second

no one member of the St Charles Town Company Shall have the power to transact any business for The Company without a written power of Attorney and it Shall be Signed by a majority of the Members

William Hartley, whose name as attached to the "constitution" has "Jr." appended to it for the first time, was a surveyor, and had brought with him from eastern Kansas a pocket compass and a chain. While perfecting their organization, or making it as nearly complete as they could, these enterprising "St. Charles" men surveyed around their proposed town site, which embraced one square mile of land; and also ran the lines of a few streets through it. They planned to have their streets run due north and south, and east and west, and their site was a square tract with its boundary lines conforming to the four points of the compass. This arrangement left a large angular-shaped tract between the westward line of the town tract and the Platte river. This was the land of which Smith and McGaa were to take possession and to "use their influence to see that it eventually becomes a part of the town and the common property of said Company." The "Point of starting" this survey is in the present block bounded by Larimer, Fourteenth, Lawrence and Fifteenth streets; and there the first stake was driven in the first proceedings toward founding a town at the mouth of Cherry creek. The river has changed its course since then, and at that time the line of the present Chestnut street would have intersected the mouth of the creek. Mr. Dickson related to the writer that he assisted in the survey, and went over near the river and cut down a young cottonwood from which he made a long, heavy stake, hewed it off smooth on two sides and drove it down deep to mark the starting point of their survey on the higher ground as above indicated, and which became that block under the Denver Town Company's platting. Then they wrote with a pencil on the smoothed sides of the stake notices that they claimed a square mile of land, of which that stake marked one corner, for a town site.



Outlines of St. Charles Town site with reference to present streets.

After the meeting of October 2nd, all of those "St. Charles" men, excepting Traders Smith and McGaa, decided to return to eastern Kansas to remain through the coming winter, and to come back here in the following spring. Smith and McGaa agreed to look after the company's interests here; and after that meeting their associates saw nothing more of them until in the summer of 1859. Cobb, Dickson and the rest of them started on their eastward journey October 9, 1858. They had made no attempt to build any kind of structure on their town-site, having made "Montana" their headquarters while they were organizing their association and platting their land at Cherry creek, and also their point of departure when they started eastward.

Of the projectors of this proposed pioneer town, three are still living. T. C. Dickson remained here until 1863 when he went to Montana Territory and mined there until 1867. He then came down to Cheyenne, which had but recently been located, and has ever since been a citizen of the Wyoming capital. Frank M. Cobb now lives in Denver; and John A. Churchill in Council Bluffs, Iowa. The company's record shows that there had been some division of sentiment as to the name given the town. The entry following that of October 2nd is the record of a meeting at which McGaa and Smith were not present, held on the day the promoters started for eastern Kansas, and reads as follows:

"Oct the 9 1858 At a meeting on the platte their being two thirds of the members present it was unanimously agreed to Change the name of the town from Golden City to St. Charles which was Dun by motion of T. C. Dickson

on motion the meeting adjourned."

In explanation of this apparently contradictory action Mr. Dickson at Cheyenne stated to the writer that "St. Charles" was the name agreed upon by all in the beginning, and was proposed by Nichols who had once lived at St. Charles, Missouri; but that afterward some of the members thought the town should be called "Golden City" in deference to the golden character of the country which faith and hope—and little else at that time—attributed to it; and that they began so calling it. He further explained that the entry should have read, to have clearly stated the action of the company, that the name should "remain St. Charles," instead of being "changed from Golden City to St. Charles." He also added that their meetings were not very formal affairs.

The foregoing accounts cover all the official proceedings of the "St. Charles Town Company," as its promoters usually called it, at the mouth of Cherry creek in 1858. A meeting is recorded as having been later held in Lawrence, Kansas Territory, that year, and to it and the final one here, in October, 1859, we shall again refer.

The "St. Charles" enterprise when it was organized was not thrown open to the very limited number of people at "Montana," and who were all that were in this part of the country at that time. The company was a close corporation which gave no publicity to its transactions until it later came into disastrous conflict with the "Denver City" company. Neither Smith nor McGaa appear to have said anything about it; which, for the latter, who possessed an unusual ability and inclination for making his presence and purposes known wherever he might be, was rather extraordinary. As both these men become conspicuous figures in our story, something more of their transactions and personal history will appear before they pass from our view.

The others of the "St. Charles" people had left on their homeward journey before any of the autumn immigrants had arrived at the mouth of Cherry creek and without knowing anything of the Russell party's intention to build winter quarters here. They travelled by the Platte river route, and their purposes were while at their homes through the coming winter to attend to all the matters of chartering their company and arranging details, so that when they would come back in the spring they would have everything ready for business; provided that intervening developments here warranted them in going ahead with their undertaking. When they were a short distance down the Platte they saw the Oakes party bound hither, and soon afterward met others of the companies that reached the mouth of Cherry creek in the latter part of October. This made them uneasy, and apprehensive that some of these people might adversely locate on their unoccupied and unimproved town-site. Therefore, Charles Nichols was delegated to go back at once and put up some kind of a building on the land as evidence of the company's priority of right to it, and then induce some of the newcomers to locate on it subject to all the claims and priority of the "St. Charles" company.

Nichols returned without delay and found that quite a change had taken place during the brief time since he and his associates had departed. The Russell-Smith cabin had been built and a considerable congregation of people assembled on the west side of Cherry creek, including Smith and McGaa. These two gave him neither aid nor comfort in protecting the town-site, and now apparently cared nothing for the interests of the "St. Charles" enterprise. Soon afterward, when the Auraria and Denver City companies were organized they became members without raising hand or voice for the welfare of the older organization. Instead of building the cabin himself, Nichols tried to get some one else to do so. Among the pioneers then here was A. C. ("Jack") Wright (still a citizen here), who had been one of the original Lawrence party which came out early in the previous summer, and of which the "St. Charles" promoters had also been members. Wright says Nichols offered or promised him sixty-two and one-half lots in the proposed new town if he would at once build a cabin for the company on the town-site; a proposition which Wright declined. Nichols then adopted an expedient that had often been employed to hold public land in eastern Kansas—that of placing four logs, in a square, on the ground—the "four-log improvement."

First structure on east side of Cherry creek—"four-log improvement."

Samuel S. Curtis, a pioneer at Cherry creek, and a man who became very prominent in the early affairs of Denver and Colorado, and for some years past a citizen of Omaha, has contributed to this work many historical facts. Of his coming here, and of the condition of the "St. Charles" enterprise and its custodian at that time, he says:

"I left Council Bluffs, Iowa, for 'Pike's Peak' on September 20, 1858, and at Columbus, Nebraska, was elected Captain of a train of emigrants. At Plum creek, thirty miles west of Fort Kearney, the train lost thirteen head of cattle by stampede, which threw us behind some other trains; otherwise we would have been the first train of emigrants to reach Cherry creek after the discovery of gold by the Georgia company. We reached camp about one and one-half miles below the creek, on October 30th."

"The Lawrence company, consisting of seven members, had claimed 640 acres as a town-site, on the eastward side of Cherry creek, calling it 'St. Charles.' Six members of the company had returned to the States, leaving Charles Nichols to protect the town-site; four logs, crossed, being the only improvement. He was without money or food, and dependent on friends for support. Courtright and I helped to take care of him, as also did old John Smith and 'Jack Jones.' [McGaa.]"

"I represented to Nichols that he must do something on his town-site or it would be 'jumped,' and he agreed that I should have an interest in the town of 'St. Charles' if I would help him hold it. I turned out our cattle to haul logs, and with Courtright and others from our camp we built a cabin of logs to about six feet high and put on part of the roof. By an arrangement with Nichols it was afterward finished and occupied by Hank Way, as a blacksmith's shop. It must have stood near the Blake street crossing of Cherry creek."

Other pioneers of that autumn confirm its location as having been near the creek and between

Blake and Wasee streets. It was thus outside the boundary limits of the square-mile town-site, but was on the additional land that Smith and McGaa were to secure for the company, between the west line of the survey and the river. The work of Curtis and Courtright on Nichols' cabin was done in the latter part of the first and early part of the second week of November. They had enrolled themselves as members of the Auraria Town Company the day after their arrival; but, for this aid and comfort given the "St. Charles" custodian they were, as will presently appear in one of the Colonel's contributions, "unceremoniously kicked out" of the organization which, by that time had come into existence across the creek. But, before poor Nichols, for whom the reader will probably feel a sincere sympathy, could get the roof of that cabin finished, the men who founded "Denver City" came in, swooped down upon "St. Charles," and opened a new chapter of local history which will furnish most of the material for our next one.

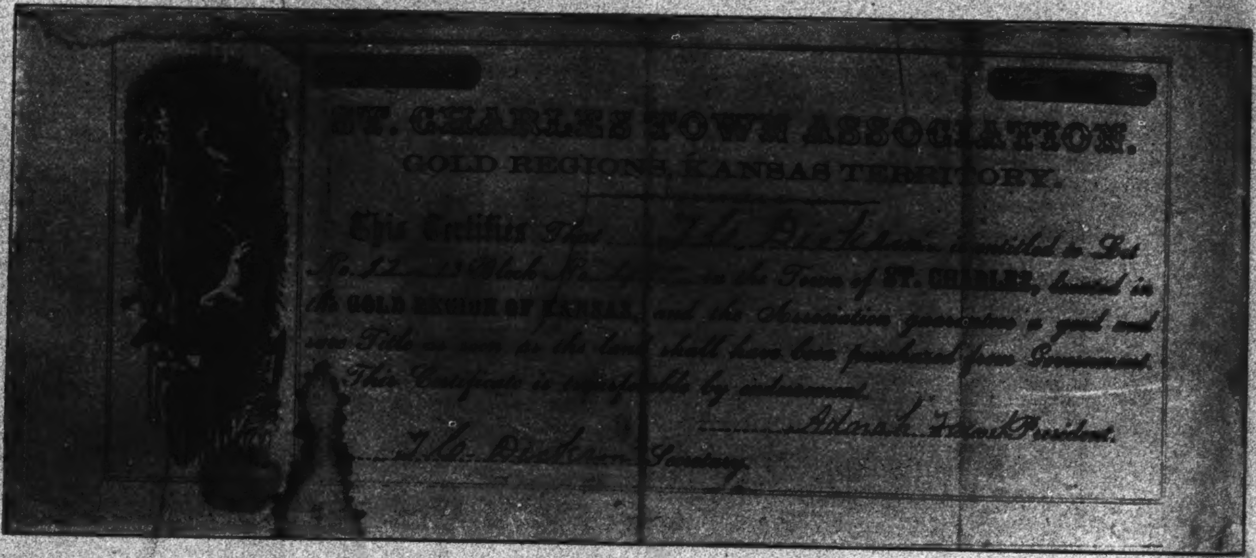
John A. Churchill.
(Photographed 1885.)

There were four separate, independent town organizations at the mouth of Cherry creek in 1858-59, three of which were later united as the City of Denver. In order, they were "St. Charles," Auraria City, Denver City and Highland. Our State Historical Society is now in possession of the original record books of the Auraria and Denver City companies; nearly the whole of the original record of the "St. Charles" company, and a complete copy of it to the termination of entries in it. If the Highland Town Company, organized in 1859, ever had and kept a record, its whereabouts are unknown. From the Auraria and Denver City records we have copied for this work everything of historical interest they contain, and have taken all of the entries in that of "St. Charles." The extracts from them are distributed through this, and various succeeding chapters.

The circumstances of the Historical Society having a complete copy of the "St. Charles" record while the original had never passed from the possession of T. C. Dickson, the Secretary of the company, were partly explained by him to the writer recently at Cheyenne. After he and his associates returned here from eastern Kansas early in the summer of 1859, found the Denver Town Company in full possession of their town-site and a town built on it, there was vigorous protest from them. But a compromise, as will presently be fully stated, was made, and the "St. Charles" men finally became shareholders in the Denver company. While some details of the agreement were yet unfinished the Denver Town Company manifested extreme anxiety to obtain the "St. Charles" record, and repeatedly asked for it and sometimes demanded it. Mr. Dickson said that he, fearing the book might prematurely pass into the other company's possession, tore out all the leaves that had been written on; that he then carefully made copies of all the removed minutes back into what was left of the old book—a long-paged, narrow "day-book." He carefully wrapped up the removed leaves and buried them in one corner of the cabin he occupied, and put the book containing the copies in the bottom of his old "carpet-sack," which also held many of his personal belongings. Shortly afterward, he was absent from his cabin an entire day, and upon his return noticed that his "carpet-sack" had shifted its position while he had been gone. Emptying it of its contents, he discovered that the "St. Charles" record had vanished; and from that time he had neither seen nor heard of it again.

A few years ago the original record of the Denver Town Company and other remains of its archives came into possession of Mr. W. N. Byers, President of the Historical Society. Among the collection were about a dozen leaves torn from a long-paged, narrow "day-book," and containing all the minutes of the proceedings of the "St. Charles" Town Association. As the Denver Company had been the successor of that organization, these minutes, being part of the archives, were supposed to be the original records of the first town company organized at the mouth of Cherry creek. Recently they were discovered to be copies, and when the writer informed Mr. Dickson of this, and that they had been found among the Denver Town Company's relics, he declared that the missing link had been supplied, and related the story embodied in the foregoing. In the meantime, through many years, he had preserved his torn-out leaves bearing the original entries; but a few years ago a couple—the last two—were lost. However, he was confident that the copies were literally accurate, and a comparison with the originals, so far as the latter extend, proved the copies to be exact. He was then asked to present the original minutes to our Historical Society and very kindly did so.

The reader will have noticed that the minutes of the first meeting of the "St. Charles" town promoters, that of September 24, 1858, set forth that it was held in "Arapahoho county, Kansas Territory." This is the first local record of the existence of Arapahoe county to be found in the annals of Denver. Mr. Dickson, who was very much the sponsor for "St. Charles," stated to the writer that none of his party at that time knew that the mouth of Cherry creek was in Arapahoe county, nor that such a county existed. He said that his party had no blank book to use as a record, and but little paper of any kind; and that he was hard put to it to find anything on which to do his work as Secretary while at Cherry creek at that time. He carried his documents and memoranda back to eastern Kansas and there wrote up his record. After his arrival at Lawrence he learned that the western end of Kansas Territory "either had been or was to be made into Arapahoe county," and therefore included its name in his record in order to make the location of "St. Charles" more definite and certain. But, in printing lot certificates, the company, as will be seen, placed "St. Charles" in the "Gold Regions, Kansas Territory," as a more alluring designation of the locality.



ST. CHARLES TOWN ASSOCIATION.

GOLD REGIONS, KANSAS TERRITORY.

This Certifies That T. C. Dickson is entitled to Lot No. 12 and 13 Block No. [illegible] in the Town of ST. CHARLES, located in the GOLD REGION OF KANSAS, and the Association guarantee a good and sure Title as soon as the land shall have been purchased from Government. This Certificate is transferable by endorsement.

Adnah French President.

T. C. Dickson Secretary.

A St. Charles Town-lot Certificate—Size of Original.

The signatures to the organization agreement, and to the "constitution" of "St. Charles," as they appear in the old record are, of course, not in the handwriting of the signers, but were written in by the Secretary. The original documents were signed here. What became of them Mr. Dickson did not know, further than that they disappeared about the time the copied record escaped from the old "carpet-sack," and probably were destroyed.

At the risk of being tedious we enter much into the details of all the proceedings of the Cherry creek town companies of 1858. It would seem to be desirable to follow them step by step until the various results of their operations were crystallized into a municipal organization by authority and under the forms of law. It would also seem that such details are of importance and should properly be made of record in a history of a city, the origin and development of which were attended by circumstances so extraordinary as those associated with the founding of Denver.

Frank M. Cobb, of the "St. Charles" Town Company, after returning to Denver in 1859, left Colorado at the outbreak of the civil war and was with the Union army until its close. In later years he returned here and is now engaged in mining. Of his participation in these pioneer events, and especially with reference to the organization of the "St. Charles" Town Company, he prepared for us the following account:

"I will give you as briefly as possible my experience, and knowledge of the facts, with and of the location of town-sites in this region. I came out in the year 1858 with the Lawrence, Kansas, party. We arrived in this vicinity on September 4, 1858, and camped about four miles above the mouth of Cherry creek, on the South Platte river, where the Georgia party, led by W. Green Russell had been panning and rocking out gold from the sands of the river and from a little creek. The Lawrence party took land near there and located a town calling it 'Montana.' A few days afterward Adnah French, T. C. Dickson who had joined our party at Pike's Peak, and myself, walked down to the place where "East Denver" is now located. We concluded that if a town or city should ever be built in this section of country it would be built here. We at once agreed to take the land, form a company, and locate and survey a town site."

"We returned to 'Montana' and soon afterward formed a town-site company, composed of Adnah French, Charles Nichols, William Hartley, William Smith, John A. Churchill, T. C. Dickson, William McGaa, John Smith and myself. Smith and McGaa were squaw men who came up the Platte and camped here for a few days; and we took them in on account of the land belonging to the Indians at that time and in order to avoid trouble because of that; though this country was then part of Kansas Territory. William Hartley was a surveyor and had a chain, and pocket compass with him. We commenced on the east side of Cherry creek and surveyed around 640 acres, and also surveyed several streets and blocks. I helped make and drive the first stake. T. C. Dickson and myself carried the chain, and William Smith went in advance of Surveyor Hartley. Not expecting any people to come in until the following spring, all of we Lawrence men in the St. Charles company, and Dickson, started from "Montana" for the States on the afternoon of October 9th, leaving only William McGaa and John Smith to represent the company here. I do not recollect anything about the change of name from 'Golden City' to 'St. Charles,' but think Charles Nichols wanted to call it 'St. Charles' when we drew up our company agreement and constitution; and I think T. C. Dickson, our Secretary, sided with him. As we went down along the Platte river we met people with wagons coming from the Missouri to the mountains. When we were about seventy-five miles on our way I suggested to the other members of the St. Charles Town Company that we ought to send some one back to look after our interests and to induce people to locate and build on the St. Charles town-site. Charles Nichols agreed to go back to the mouth of Cherry, and I and the other members proceeded on our way to Lawrence, Kansas, intending to get a charter for our company and arrange other things through the winter, and come back the next spring. Some time later, some time after New Year's, Charles Nichols got back to Lawrence and informed us that a party arrived at the mouth of Cherry creek soon after he returned there, had taken possession of our location, and had laid out a town they called 'Denver City;' that they had threatened him with violence and were in full possession. We concluded that there was but one thing to do; we must go into the Kansas Legislature, then in session, and try to get a charter for St. Charles right away. We did so and at last succeeded in getting a bill passed, and signed by Governor Medary, who had succeeded Governor Denver. The pioneer town-sites around here were located in this order; first, 'Montana;' second, 'St. Charles;' third, 'Auraria City;' fourth, 'Denver City.'"

It is to be remembered while we are considering the affairs of these Town Companies that none of them had any valid title to the soil on which their operations were carried forward. All of them were merely squatters on land to which the Indians had the first claim under the conditions then existing. Later, in giving lots to all who would build on them, or in donating lots to first-born children, or to this or that especially worthy citizen; or in keeping a liberal share for themselves, these excellent and enterprising men were dealing with things which they did not, legally, own; nor was it any better if they sold a lot for cash. As this was Indian land not open to entry, no title could be acquired to it through the ordinary operation of the land laws of the United States. This was the legal aspect of the situation; and in theory, at least, it remained so until, in 1861, a treaty was made at Bent's Fort pursuant to a resolution of the United States Senate, with the Cheyenne and Arapahoe Indians, under which they ceded all their lands "in the Pike's Peak region" to the United States. This was done as part of the proceedings in organizing a new Territory here, but it did not give title to these town companies. Prior to that extinguishment of Indian title and, as a matter of fact, for some time afterward, possession and improvement of the town lots carried title of right that was maintained with guns upon occasion; though it was not until Congress enacted the law of May 28, 1864, "for the relief of the citizens of Denver," and making what is known in real estate annals as "the Congressional grant," that these defective titles growing out of the irregular proceedings of the founders of Denver, were confirmed and made good.

Frank M. Cobb.
(From a recent photograph.)

It may be well to mention at this juncture that when the organization of the Auraria Town Company was undertaken, the two Indian traders, Smith and McGaa, made some claims to general rights to the land around the mouth of Cherry creek, for which they demanded concessions. Their claims were pretended to be based on their imaginary rights by virtue of priority of occupation of the country as traders and trappers, and on the more valid rights of their Indian associates to all the land here. There was some ground for the Indian claim, but none for the other. However, the Aurarians, for the sake of harmony conceded to Smith and McGaa the privilege of a ferry across the Platte, gave them a liberal share of town-lots, and made them officers in the organization; but the pair did nothing as ferrymen, and but little more as officers. Each of them was about half Indian in everything but birth, but they had a strong influence among their copper-colored relatives and allies that might be of great importance should the Indians resent the location of towns on their lands.

Having followed the fortunes of the first town undertaking to the eve of its overwhelming misfortunes, we will now take up the story of the second municipal enterprise on the site of Denver. After the arrival of D. C. Oakes' party and the return of Dr. Russell from Fort Garland it was decided that if any considerable number of people later arrived in that autumn, a town should be laid out on the west side of Cherry creek. Within several days thereafter, as we have seen, several parties came in and camped on the west side of the creek where the others were. Notwithstanding the preferences and operations of the "St. Charles" men all the people at the mouth of Cherry creek were congregated on the west side; but there was, however, a camp down the Platte about where the present stock yards are located. This situation resulted in a public meeting of the people here, on October 30 to organize a town company and provide for laying out a town.

The record of the Auraria Town Company is well-kept, in neat, legible handwriting and in good form. It affords evidence of systematic, businesslike methods, and of an intention to promote the common welfare by affording all who were then here an opportunity to unite in common action. In these features there is a marked contrast to some of those appearing in the record of the "St. Charles" enterprise. The accounts of the initial proceedings leading up to the organization of the Auraria Company were copied into the book from memoranda, as the Secretary was careful to indicate, the first entry being as follows:

Copy. October 30, 1858.

At a meeting of the Citizens of the South Platte for the purpose of selecting a suitable site for a town, Wm. McFadding was appointed as chairman, and A. J. Smith as Secretary of said meeting. The President stated the object of the meeting.

On motion of Mr. Hutchins a committee of five was appointed to select said site, with power to examine into any and all previous claims. The chair appointed the following, viz: Hutchins, Dudley, Dr. Russell, J. S. Smith and Rooker.

The Committee reported that they were not able to report at this meeting and asked further time. Permission being granted.

On motion of A. J. Smith a Committee of five was appointed to draft a Constitution, and by-laws, to govern the Town Company. The Chair appoined the following, viz: A. J. Smith, J. H. Dudley, Wm. McGaw, L. J. Russell, and S. M. Rooker.

On motion Wm. McFadding was added to the Committee.

On motion meeting adjourned to Oct. 31, 1858.

A. J. Smith, Secretary.

Promptly the next day the "Citizens of the South Platte" held their second meeting, of which the record tells the following:

Copy. October 31st, 1859.

Meeting met pursuant to adjournment, Mr. McFadding in the Chair.

Minutes of Meeting 30th inst. read and approved.

The Committee to whom the selection of a town site was referred reported the Following, which was adopted, viz:

'The Committee report that they have selected a town-site upon the following lands. A tract having Cherry Creek for the Easterly line and the South Platte for the northerly line, and extending west and south sufficiently to include not less than Six hundred and forty acres. The claimants to said portions being present and acquiescing. Reserving and excepting for the Benefit of Wm. McGaw and John S. Smith the privilege of a ferry landing within the river boundary of the town lands.'

The Committee appointed to draft a Constitution and By-laws reported on the Constitution and By-laws, which were adopted with the following amendment, viz: To the 9th article of the Constitution—When it becomes necessary to lay a tax for any improvement upon the town site it shall be the duty of the Board of Directors to call a meeting, notifying the Stockholders to that effect. A majority of the quorum always being necessary to levy such tax.

On motion adjourned.

A. J. Smith, Secretary.

Here we have two members of the "St. Charles" Company—McGaa and John S. Smith—identifying themselves with its rival before their recent associates were far out of sight on their homeward way across the plains.

The constitution and by-laws as amended to the committee's report state in the preamble that they were agreed to at a meeting held November 1st. The Secretary's record states that they were adopted at the meeting of October 31st; however, this conflict of dates is unimportant. The following is a copy from the record:

"Constitution of Auraria Town Company."

"We, the Citizens of the South Platte have assembled on the First day of November, A. D., One thousand, Eight hundred and fifty-eight, and agreed to associate ourselves into a Company to be known and distinguished as the Auraria Town Company, by which name we hold ourselves liable to sue and be sued, and to transact business as an individual and legal body.

Article 1st.

This Company shall be known and distinguished as the Auraria Town Company.

Article 2nd.

There shall be elected by the Stockholders of said Company a President, Vice President, Secretary, Treasurer, and One Director, who shall hold their offices for the term of one year from the date hereof, at the expiration of which term there shall be a new election.

Article 3rd.

In case of any failure of such election at the expiration of said term of One year, or should a vacancy occur through resignation, death, or absence, a majority of the board may direct a meeting of the Stockholders to be called and elect others in their places.

Article 4th.

It shall be the duty of the President to preside over the meetings of the Board, to preserve order, and likewise to sign all certificates of shares, and to discharge all the duties usually devolving upon the President of meetings and of companies.

Article 5th.

It shall be the duty of the Vice President in case of death, resignation, or any absence from any cause, of the President, to discharge all the duties required of the President.

Article 6th.

It shall be the duties of the Secretary to keep the books and accounts of said Company, to record all meetings of the Stockholders, or of the Board of Directors; likewise to sign all shares and transfers of shares and record the same. Keep a record of all documents and papers relating to Town property, and to notify stockholders of all assessments and when to be paid.

Article 7th.

It shall be the duty of the Treasurer to take charge of all monies which the Board of Directors may place in his hands, and receipt for the same; to collect all assessments which the Board may make, and receipt for the same; and shall upon an order from the Board disburse any funds belonging to said company, and shall submit a statement of his proceeds in office at any meeting of the Board when called upon to do so by said Board.

Article 8th.

The President, Vice President, Secretary, Treasurer, and One Director shall Constitute a Board of Directors, all to be chosen from the Stockholders of said Company.

Article 9th.

It shall be the duty of the Board of Directors to superintend the surveying, platting, lithographing or mapping, of the Town Site. Printing or writing shares of stock, superintending all company improvements, and hold all Company property in trust for the benefit of said Company. And also—when it becomes necessary to levy a tax for any improvements upon the Town Site, it shall be the duty of the Board of Directors to call a meeting notifying the stockholders to that effect. A majority of a quorum always being necessary to levy such a tax.

By-Laws.

Article 1st.

All shares donated by said Company shall be improved in such manner as the Board of Directors may contract, within Sixty days after the day of Donation. But if such specified improvements be not made, then the title of such person or persons to whom such donation shall have been made is null and void.

Article 2nd.

The election of Officers shall take place on the first Monday in November in Each year, the vote shall be cast by ballot, and two-thirds of the vote cast shall be necessary to a choice.

Article 3d.

Each stockholder shall be entitled to one vote at the first election. At every succeeding election each stockholder shall be entitled to one vote for every share of stock as originally issued, provided all arrearages of assessments are paid.

Article 4th.

Thirty days shall be allowed for payment of assessments, and if not paid within said thirty days the Secretary shall advertise the same for thirty days additional, and if not paid within said time the Secretary shall cause such share or shares to be sold to pay such assessments.

Article 5th.

The owner or owners of any stock sold as above provided to pay assessments, by paying, within 90 days after such sale as aforesaid, the purchase money and fifty per centum added thereto, shall be entitled to redeem such stock.

Article 6th.

Each member of the Board of Directors shall be held under bond for the faithful discharge of his duties as such member, the sum of which bond not to exceed the sum of Twenty-five hundred dollars and not less than Two thousand dollars.

Article 7th.

There shall be set apart four hundred shares for the use and benefit of the Stockholders, the remaining two hundred shall be set apart for donation, public improvements, etc., and it shall be the duty of the Board of Directors to take charge of such donations, and all profits arising from such donations shall be set apart for the benefit hereafter of said Company.

Article 8th.

The number of Original Stockholders shall not exceed the number of One hundred. In the absence of any stockholder he may appoint an agent to cast the vote or votes to which he may be entitled, and to act as proxy, generally.

Article 9th.

No transfer of stock shall be considered legal unless such transfer be signed and recorded by the Secretary in the books of the company at the time of making such transfer.

Article 10th.

Shares of stock shall be issued to each and every stockholder when such Stockholder shall have, or cause to have been, constructed within the City Limits a house not less than Sixteen by sixteen feet, to be approved by the Board of Directors. Such improvements to be made and completed on or before the first day of July, A. D. 1859, or the shares become forfeited to the Company.

Article 11th.

This Constitution and By-Laws thereunto annexed may be revised and amended at any general meeting of the Company by a vote of Two-thirds of the Stockholders of said Company."

Having laid these broad and liberal foundations for their town the Aurarians proceeded, on the 6th of November, to elect their officers, of which election their record book gives the following account:

"November 6th, 1858."

"At a meeting of the Stockholders of the Auraria town Company an election of Officers took place at which

William McFadding received 84 votes for President.

J. H. Dudley received 84 votes for Vice President.

L. J. Russell received 84 votes for Secretary.

John S. Smith received 84 votes for Treasurer.

Henry Allen received 84 votes for Director.

Whereon the above named were declared duly elected for the term of One year.

A. F. Graeter,
Clerk of Election.
John J. Shanley,
Clerk of Election."

W. M. Slaughter,
Judge of Election.

The name of the company's first President appears in the record as "William McFadding" and as "William A. McFadding," but both apply to the same man.

The record contains no reference to the circumstances of selecting or deciding upon a name for the town. The first appearance of the name "Auraria," is in the title line of the constitution and by-laws. Dr. L. J. Russell was a member of the committee which drafted those documents, and, as will presently be explained, the name was one of two submitted by him at the time. When the meeting of October 31st adopted the constitution and by-laws the name "Auraria" was also adopted.

Judson H. Dudley (Deceased).
(Photographed in 1879.)

Immediately succeeding the entry of the constitution and by-laws in the record, appears the following:

"List of the Stockholders of the Auraria T. Co., Nov. 1st, A. D. 1858.

Wm. McGaw,
John S. Smith,
Andrew J. Smith,
Hiram J. Graham,
E. P. Stout,
A. J. Williams,
S. M. Rooker,
James R. Compton,
Henry Springer,
Jarvis Richardson,
James Gordon,
John J. Shanley,
J. D. O'Connell,
Wm. S. Foster,
R. J. Pierce,
W. J. Russell,
J. O. Russell,
V. W. Young,
A. F. Graeter,
Judson H. Dudley,
E. H. Conart,
Wm. A. McFadding,
Henry Allen,
E. B. Shorpe,
Theodore Herring,
J. H. Clarke,
Wm. Regan,
L. J. Russell,
Solomon Roe,
Luke D. Tierney,
J. H. Pierce,
A. C. Wright,
J. W. Reed,
John Pander,
John F. Palmer,
Nicholas Migel,
George Maus,
Theodore Fetts,
John Granfred,
W. A. Smith,
A. H. Barker,
John Kinna,
W. H. Longsdorf,
Phillip E. Peers,
A. H. Ramsdale,
John Easter,
Roswell Hutchins,

Wm. McKimmons,
Hayman Chapman,
Charles Johnson,
Fred Grider,
James F. White,
James Lowry.

All the men whose names are given in the foregoing list were not at the mouth of Cherry creek when the organization meetings of the Aurarians were held, nor on November 1st as set forth in the title line of this list. The names of some absent ones, such as those of W. G. and J. O. Russell, were, of course, entered by friends who were here. Apparently, names were added to the original list, as new parties came in, until the complement of one hundred was completed. Some persons whose names appear above did not arrive until late in November. Nevertheless, it is a valuable and interesting roster of the pioneers of Auraria City.

Colonel S. S. Curtis tried to line himself up with the founders of Auraria City but failed. Of this incident he relates the following:

"I attended a meeting for the organization of the Auraria Town Company on October 31st. The first hundred men whose names were entered on the paper of organization were to compose the company. I put down my name, and that of Courtright, one of my associates; of William Cole, 'Jim' Gordon and of several others in our camp. However, Courtright and myself were later unceremoniously kicked out of the company when it was discovered that we were negotiating with Charles Nichols for an interest in 'St. Charles.'"

The Auraria Town Company was never incorporated. Of this matter Dr. Russell states:

"Application for a 'charter,' as it was then called, for Auraria was made to the Kansas Territorial Legislature, but if it was ever granted we received no certificate or other form of notice of it; not, at least, during my connection with the company. We did not consider it of very much importance, under the circumstances."

Soon after Dr. Russell ended his official connection with the town company the "Legislature" of "Jefferson Territory" enacted a consolidating "charter" which was held to be sufficient for its time and purpose.

On November 8th the Auraria Board of Directors held their first meeting. Committees on finance, on streets and alleys, on claims, on internal improvements, and on rules and order of business "for council" were appointed. On motion of Director Henry Allen it was

"Resolved, That the engineer be authorized to commence the survey of the Town of Auraria under the instruction of the Committee of Internal Improvements."

The boundaries of the Auraria City town-site, enlarged from the original plan so as to embrace about 1,200 acres, were technically defined as follows:

> "Beginning at a point in the middle of the main channel of the South Platte River opposite the mouth of Cherry Creek; thence up the middle of the main channel of Cherry Creek two miles; thence north sixty degrees west to the middle of the main channel of the South Platte River; thence down the same to the place of beginning."

On motion of Vice President J. H. Dudley it was agreed that the lots should be sixty-six feet front and one hundred and thirty-two feet deep; the four main streets running from the "public square" to be one hundred feet in width, the other streets to be eighty feet, and the alleys sixteen feet. The "public square," however, does not appears on the map published in 1859.

On motion of Secretary L. J. Russell it was resolved that each member be required to build a house at least sixteen feet square "and comfortable to live in," to comply with the requirements of the company.

Then Treasurer Smith, the trapper-trader, gave proof of his belief in the utility and power of the press by offering the following resolution, which was adopted:

> "Resolved, That there be Donated to the person or persons who will first establish a printing Press in the Town of Auraria, and maintain the same for one year, four shares of stock."

A share called for four lots, and this proposed subsidy was the equivalent of sixteen Auraria lots; but what they called an "original share" carried with it sixteen lots.

The claims committee was then instructed "to confer with those interested in the claims adjoining the Town and get such Quit claims and other relinquishment as may to them seem necessary." As there were no claims "adjoining the town" except those of the "St. Charles" people, this indicates that the Auraria Directors had their eyes on the land east of the creek.

Notwithstanding that the survey of the town was "authorized" at the Directors' meeting of November 8th, it had, as a matter of fact, been commenced earlier; and that entry in the record was intended to confirm the preliminary work already done by an unofficial understanding. The first surveyor employed was William S. Foster, who made fair progress with the work in November and December. At a meeting of the Directors held December 3d, it was agreed that orders "be issued to William Foster, Surveyor, for one hundred and twenty dollars for services rendered, payable July 1st, A. D. 1859." After this the work seems to have dragged. On April 22, 1859, the Directors resolved that the Surveyor be ordered to complete the survey and to make a plat; and, also, "to survey the bottoms on the Platte and Cherry creek, dividing those on the Platte into one hundred equal parts, and to report the amount of land on Cherry creek." On July 8th the Auraria Directors resolved "that W. S. Foster be required to finish survey of the City as far as he has the same platted." It would seem that this should read "finish plat as far as he has the same surveyed," but it does not. At this same meeting the finance committee was instructed "to contract with George L. Moody to complete survey of the City of Auraria." Surveyor Moody appears to have been dilatory, for the Directors at a meeting held September 30, 1859, resolved that the surveyor be notified "to return the plat corrected, and finish the survey in one week, or his contract to be forfeited." This appears to have finally brought the survey near enough to a conclusion to enable Fosdick and Tappan to make their map of December, 1859, which shows the three Cherry creek towns. But Surveyor Moody did not complete all the details of the Auraria survey until the following spring. On January 18, 1860, he and the Directors had a final settlement and agreement, under which he finished up the long drawn-out piece of work.

In 1858 the course of the Platte river by the pioneer towns was somewhat different from its present way. Between our Eleventh and Twenty-third streets it described the outline of a pair of ox-bows, one of which received the water of Cherry creek near the line of Chestnut street. On the eastward side the other bow projected in as far as the site of the Union Railway Station, over a part of which the river then flowed. Later the stream cut across these bows and found its present channel, though railroad grades in later years did much toward confining the stream and straightening its channel. The map of the old towns shows the river's former devious course.

At their second meeting of record, held November 15, 1858, the Auraria Directors adopted their rules and order of business, and then resolved to donate four lots to John D. Baker "for the purpose of erecting a hotel or House of Entertainment, and that the said John D. Baker on completion of said House of Entertainment be made a Quit Claim Deed to the said four lots, said Lots to be selected by said John D. Baker, out of any lots not otherwise appropriated." This appears to have been the first lot-donation made by the company.

Then followed instructions to the surveyor to plat as much of the town as he had surveyed, and to the Secretary to assign lots to shareholders as soon as he received the plat. At this meeting the Directors also adopted the following:

> "Resolved, That there be hereafter donated one lot to each person who will build a house on said lot under the instruction of the Secretary, and those who are now building or living in the Town shall be entitled to one single share, under the instruc-

Dr. Levi J. Russell.
(Photographed 1888.)

tion of the Secretary, but in no case to extend to more than sixty shares; And when donation lots are selected the Secretary shall cause to be selected only every alternate lot in each block."

The next business was to provide a circulating medium of home production. On motion of President McFadding it was

> "Resolved, That the City of Auraria by its City Officers issue five hundred dollars in scrip, and bind the faith of said City to redeem the said scrip on or before the first day of July, A. D. 1859. Said scrip to draw interest at the rate of ten per cent. per annum. Said scrip to be received in payment of any debts due said City of Auraria."

The resolution was adopted after providing that the scrip be issued in denominations of five and ten dollars.

At the next meeting, held November 19th, the Directors authorized the Secretary to demand and receive a fee of fifty cents for assigning lots to shareholders, and also authorized that officer to secure to Captain William A. Smith ten lots in exchange for certain lithographed plats of Auraria City which Smith had engaged to have made. Then the claims committee reported that "they had contracted with William McGaa and John S. Smith for their claims and had filed the contract with the Secretary; and also that they had given the said Wm. McGaa and John S. Smith a ferry privilege."

The next meeting was held December 3rd, at which donations of lots were made to Thomas P. Parker, Benjamin Bernheizer, Frederick Dimitt and William Blick.

Several other meetings were held in December but their proceedings were mostly of unimportant routine character. On December 17th the Directors were petitioned by J. T. Parkinson, William Parkinson, O. B. Potter, Charles Noble, Albert Bober, P. T. Bassett, John Harris, Charles Dahler, James Reed and John Scudder, to grant further time to them as lot-owners and house-builders in which to comply with their contracts with the company. The petitioners set forth that they wanted to build better houses than a man could put up by himself, and that they had to haul their logs a long distance—in some instances as far as six miles. They were granted an extension of sixty days. At a meeting held December 24th it was resolved to "donate sixteen lots to Mr. Hall for building a hotel under the instructions of the Secretary, who is hereby authorized to contract with said Hall, he (Hall) to select four of the lots." A meeting was held December 31st, but "Having no business to transact" it adjourned until January 7, 1859.

Notwithstanding that Baker and Hall each had been granted donations to enable them to build houses of entertainment, neither put up the first one. The town was without a "House of Entertainment" until the next February.

Auraria was named after a little village in Lumpkin county, Georgia, which is in the old gold district in the northern part of that State, and of which Dahlonega is the county seat. W. Green Russell's Georgia party, as we have seen, was recruited in that county, and his brother, Dr. L. J. Russell, who named our Auraria, came from that Auraria. Whatever the Georgia Auraria may have been forty years ago, it is not much of a town at this time; as, according to the census of 1890, it then had a population of but seventy-five. In the census of 1900 the village does not figure as a separate organization.

Much fanciful speculation was formerly employed in efforts to account for the name of Auraria City. Some persons asserted that it was derived from that of a person; others suggested that it came from Aurora, the Roman goddess of the dawn; another far-fetched theory was that it was twisted out of the word "auriferous," and intended to indicate the character of the country around the new town; "Uncle Dick" Wooton, in his book, offers his contribution as follows—and he settled in the place a few weeks after it was named:

> "There must have been some classical scholars among the founders of the town, because I am told that the name has a Latin origin, the word "aura" meaning a gentle breeze. I suppose Auraria was intended to mean the town of gentle breezes, and it was a rather pretty and appropriate name."

Of the circumstances associated with selecting a name for the first real settlement at the mouth of Cherry creek, Dr. Russell has favored us with the following definite information:

> "I submitted two names to the meeting: "Dahlonega," which was and is the name of the county seat of Lumpkin county, Georgia; and "Auraria," the name of my home town in the same county. The latter was chosen. I very much preferred the name Dahlonega (in Cherokee, 'Tau-lau-ne-ca'), which means in the Indian dialect, Gold or 'yellow money.' It was said at home that the name 'Auraria' was conferred on our little village by John C. Calhoun of South Carolina, and that its meaning was 'golden head.' This story, it is evident, was wholly mythical. However, the name 'Auraria,' regardless of its meaning, was chosen by our new town company on the South Platte."

Dr. Russell's Auraria was the first duly located and platted "city" at the mouth of Cherry Creek, and the definite beginning of Denver. It was the cradle of pioneer business life, and within its limits the first newspaper here was printed. The pioneer church, and Sunday school, were organized and nurtured in Auraria, and in one of its cabins the first secular school was established. The first movement toward organizing a new Territory or State was made there, and the hospitality of one of its citizens provided ways and means for the first celebration of Christmas at the mouth of Cherry creek.

CHAPTER XXII.

DENVER CITY TOWN COMPANY—GENERAL WILLIAM LARIMER—PROMPT ORGANIZATION—INVASION OF THE "ST. CHARLES" TOWN SITE—PROCEEDINGS OF THE COMPANY—LISTS OF SHAREHOLDERS—PROVISION FOR THE "ST. CHARLES" MEN—NICHOLS' FATE—LOT DONATIONS—DENVER CITY AND GOVERNOR DENVER—SURVEYING THE TOWN—ATTEMPT TO INCORPORATE DENVER CITY COMPANY—INCORPORATION OF THE "ST. CHARLES" COMPANY—FINAL PROCEEDINGS OF THE "ST. CHARLES" MEN—COLLAPSE OF THE ENTERPRISE—ADNAH FRENCH—McGAA'S PROMINENCE AND DEATH—"CITY OF HIGHLAND"—MARCY'S THEORY—DECIMATION OF TIMBER—DISAPPEARANCE OF "MONTANA CITY."

The founding of Denver City, the vigorous pioneer rival of Auraria City, was a somewhat theatrical performance, and one which suddenly terminated the brief career of unhappy "St. Charles." President French and his companions had no more than ended their homeward journey when the men from Leavenworth, and the three "county officers" commissioned by Governor Denver arrived at Cherry creek on November 16th, as heretofore stated. The more prominent men in this combined party were General William Larimer, Jr., W. H. H. Larimer, Richard E. Whitsitt, Charles A. Lawrence, Folsom Dorsett, and M. M. Jewett, of the Leavenworth contingent; and H. P. A. Smith, Hickory Rogers, and E. W. Wynkoop, the trio of "county officials." On the first page of the Denver Town Company's record book General Larimer subsequently made the following entry, or memorandum:

> "I left Leavenworth City on the 3d day of October, 1858, and arrived at the head of Cherry creek on the 12th day of November, and on the 16th I landed at what is now Denver City at the mouth of Cherry creek on the South Platte river. My son, Wm. H. H., accompanied me through the long and tedious journey with a 4-yoke ox-team. I am now living in a house built for a blacksmith's shop. Our immediate company consisted of Messrs. Lawrence, Dorsett, Whitsitt, Jewett and my son William.
> Wm. Larimer, Jr.
>
> Denver City, 24th Nov., 1858.

The house "built for a blacksmith's shop," in which General Larimer was then living, was the Nichols cabin which had been built up for Nichols in place of the "four-log improvement," by S. S. Curtis and his associates.

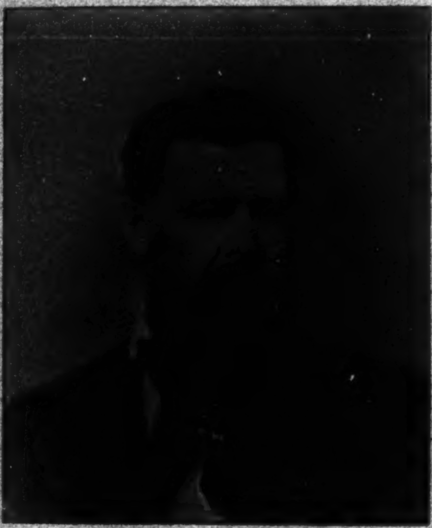
Mr. W. H. H. Larimer, now and for some years past conspicuously identified with the live-stock and packing interests of Kansas City, wrote us the following brief account of his father's life, and of the circumstances under which the Leavenworth party came to the Pike's Peak country:

"My father was born October 9, 1809, in Westmoreland county, Pennsylvania, about twenty miles east of Pittsburgh, on the old Larimer homestead on the Pittsburgh and Philadelphia turnpike and about two miles from a station which bears his name, on the Pennsylvania Railroad. His ancestors came from Scotland about the year 1700 and settled in what is now Adams county, Pennsylvania. His boyhood was spent on a farm, but he soon developed into a business man, and for many years he was prominent in business circles in Pittsburgh, having been engaged in the banking business. He was the projector of the Pittsburgh and Connellsville Railroad, which is now part of the Baltimore and Ohio system, and was its first President. In the spring of 1855 he came west and located in Nebraska, where he took an active part in the early settlement of the country. He was in the Nebraska Territorial Legislature, of 1855-56. He first settled at the mouth of the Platte river, but later moved to Omaha, and in the spring of 1858 removed to Leavenworth, Kansas."

"The circumstances of our going to Cherry creek were as follows: My brother, John M. M. Larimer, was engaged at Leavenworth in the banking business and in dealing in land warrants. About the last of August or the first of September, 1858, a man giving his name as King, and claiming to have been one of W. Green Russell's party, came into the bank with a few flakes of gold in a vial, and wanted it tested; he said it came from Cherry creek. My impression is that it was the first gold that reached the Missouri river from Colorado, which was then part of Kansas. It naturally created an excitement, not only in Leavenworth, but all up and down the Missouri river."

"A company of about sixty was immediately organized at Leavenworth to go to the Pike's Peak country, but on the first day of October, our leaving time, only six of us made the start; my father, C. A. Lawrence, Folsom Dorsett, M. M. Jewett, R. E.—or, as we called him, 'Dick'—Whitsitt, and myself; I being the youngest of the party, and not yet eighteen years of age. We took the southern route, up the Arkansas river. Our outfit consisted of four yoke of oxen, a wagon, and saddle ponies for each member of the party. We arrived at the mouth of Cherry creek on the 16th of November, and camped in what was then called Auraria, one night. The next morning, November 17th, my father went across the creek and made claim to the land. We camped near where Blake street crosses Cherry creek. Right back of our camp toward the Platte, was a grove of a few acres of young cottonwood trees. It was in that grove that I, myself, cut logs with which to build the first cabin on the town-site of the City of Denver. Its place was made a corner lot, and Samuel Curtis, from whom Curtis street takes its name, and myself, staked off the four corners of what is now the intersection of Fifteenth and Larimer streets."

These Leavenworth men also knew a thing or two about real estate manipulations, as they were from a locality in which little had been left to learn of such matters. Immediately upon their arrival they carefully viewed the situation of Auraria, considered the relations of Cherry creek to the probable routes of travel, and then quickly decided that French and his friends were right in their judgment when they selected the east side of the creek as the better place for the future metropolis of the Rocky Mountain country. The next day, November 17, and before they had been twenty-four hours on the ground, they took possession of the townsite of "St. Charles," which they alleged was deserted.



General William Larimer (Deceased).
(Photographed in 1860.)

This proceeding was nothing more than an unceremonious "jumping," but it was effectively done. The only "improvement" on the land was the Nichols-Curtis rude, unfinished cabin — later "Hank" Way's blacksmith shop. The Leavenworth men claimed that there was no evidence on the ground of the prior survey which T. C. Dickson and his associates had made early in October; but it is not at all probable that the Leavenworth men went around with lanterns at night in continued search for the stakes they had failed to see in the daytime. Some of the members of the "St. Charles" Town Company who might have been expected to protect its interests, were then in Auraria City. William McGaa, its Vice President; and John S. Smith, its Treasurer, were here; but they were indifferent, as they had by this time acquired interests in Auraria. Charles Nichols, who had returned after making a start for home, to build, or to get some one to build, a cabin on the land to guard against the very thing which now had happened, and which his friend Curtis predicted would happen, was also present. Hollister, in his "Mines of Colorado," says:

> "The interests of St. Charles were left in the hands of a man who sold out to the 'Denver Town Company.'"

If this were intended to apply to Nichols it would seem to have been an unjust reflection upon him, for he protested vigorously against the acts of the invaders, and at first did all he could to obstruct them, but to no purpose. If there were a betrayal of "St. Charles" interests it is more than probable it was the work of John Simpson Smith or William McGaa.

Mr. E. P. Stout informed us that "Nichols was notified that at his next attempt to make trouble a rope and noose would be used on him." This proposition, of course, had a quieting effect upon Nichols, and he concluded to enter into negotiations with the invaders, of which proceedings Colonel Curtis supplies us with the following testimony:

> "About the middle of November the Leavenworth party arrived with commissions from Governor Denver as county officers, and commenced negotiations with Nichols for interests in 'St. Charles,' agreeing to make it the county seat, etc. He had a meeting with them at which he gave up to them the control of the 'St. Charles' town-site. I was not at the meeting, but Nichols and old John Smith agreed to see that I should have an interest in the new company. I slept on the earth floor of old John's cabin that night with his half-breed son, young Jack, who was later killed at Sand creek. Old John came home about twelve or one o'clock and told me that Courtright and I were members of the new town company. I think it was at that meeting the name of Denver was adopted and the town company organized. I drew the first plat of the City of Denver, and staked out Larimer and Blake, E and F and a few other streets, in November and December, 1858."

The new men had at once interested in their enterprise many others who had recently arrived at Cherry creek, and among them E. P. Stout, P. T. Bassett, Judson H. Dudley, Charles H. Blake, A. J. Williams, William Clancy; and also McGaa, and John S. Smith. Mr. Stout, a man of energy and ability, and who became the company's first President, had come with a party from Omaha which arrived here on October 26th. He now lives in Wyoming, a suburb of Cincinnati, and is the President of the Cincinnati Savings Society.

William McGaa and John S. Smith did not behave well toward their first associates in town company organization. They had, as we have seen, promptly allied themselves with the organizers of Auraria City, becoming members and officers of that Town Company; and now, discarding all pretense of regard for the interests and welfare of the pioneer "St. Charles" municipality, they willingly joined its invaders. In the absence of a habitable building on the "jumped" town-site, the first preliminary meeting of the "Denver City" promoters was held in McGaa's cabin in Auraria on the evening of November 17th.

Under the relaxing influence of a pot of hot and powerful frontier whiskey punch provided and freely shared by the host, the strangers were soon in possession of all the official and unofficial secrets, plans, purposes, intentions, hopes and expectations of the "St. Charles" Town Company.

E. P. Stout.
(From a recent photograph.)

The record book of the Denver Town Company was not so systematically kept as that of the Aurarians, and there is considerable confusion in the entries. In some instances it is difficult to determine the sequence of the transactions. No account is given of the preliminary meetings of the organizers of that vigorous association. The first record of the company's proceedings is as follows:

"Denver City Company adopted the Constitution on the 22nd Nov. 1858, and elected the following Board of Directors and officers:

President—E. P. Stout.
Treasurer—Wm. Larimer, Jr.
Secty.—H. P. A. Smith.
Recorder—P. T. Bassett.
Directors—E. P. Stout, Wm. Larimer, Jr., J. McGaa, C. A. Lawrence, Wm. Clancy, Hickory Rogers, P. T. Bassett.

The Board of Directors appointed Wm. Larimer Jr Secty of the Board and also Selected the Same to donate lots under the instructions from the Board. Under a previously appointed committee of Messrs. Rogers, Bassett, McGaa, Lawrence and Larimer, they secured the services of —— Curtis and laid out one principal street [Larimer] and further the same Committee set posts and bounded two miles square for a town site. Called Denver City.

Wm Larimer Jr
22 Nov 1858 Secty of the Board.

So, in less than a week after their arrival these Leavenworth men had taken possession of the "St. Charles" town-site, got together an association nominally of forty-one persons, perfected their plans, and were ready for surveying and platting their town.

All subsequent entries in the record are those of the Secretary of the Board of Directors; and Secretary H. P. A. Smith, of the Town Company, proper, appears to have had nothing to do. The constitution of the company is not recorded, and the by-laws, which were not adopted until January 10, 1859, contain nothing of special interest now. They are merely definitions of the officers' duties, and regulations for transacting routine business.

The entry next to the one above-quoted relates that on Thursday, November 30th, "The Denver Town Company passed a resolution instructing the Board of Directors to contract with Messrs. Curtis and Lowry to survey and stake and plat 320 acres of the town." In obedience to this behest the Directors "entered into a written agreement with Messrs. Curtis & Lowry to survey, plat and stake 320 acres of the town for 75 cents per lot 25 feet by 125 with 16 feet alleys and 80 foot streets, with payments as follows fifty dollars on the 1st of Jany next one hundred and fifty dollars on the 1st of Feby next and the remainder on the 1st of July next."

The Denver City Directors' record contains no definite list of shareholders in the Town Company, such as we find in that of Auraria City. But a good substitute for it is found in the record of the first assessment made on shareholders, which is entered as the "Assessment of 22nd Nov. 1858," and is for one dollar and fifty cents on each share. The names entered are as follows:

Adam French
Wm. McGaa
T. C. Dickson
Frank M. Cobb
Charles Nichols
John S. Smith
John A. Churchill
A. J. Williams
Oscar Totten
E. P. Stout
Judson H. Dudley
Geo. W. Fuller
J. B. Reed
Charles H. Blake
Wm. Parkinson
Wm. Clancey
Hickory Rodgers
Levi Thompson
Geo. McDougall
Charles A. Lawrence

Curtis and Lowry
Folsom Dorsett
Wm. H. Russell
E. W. Wynkoop
James McGargill
Jos. L. McCubbin
Wm. Larimer, Jr.
N. W. Welden
R. E. Whitsitt
P. T. Bassett
T. J. Parkinson
W. H. H. Larimer
M. M. Jewett
Richard Courtwright
Samuel S. Curtis
Philip E. Peers
Hugh S. Walsh
Wm. Brindle
David Michele
R. S. Stevens
S. O. Hemingway.

Book "A" of the Arapahoe County Records of Deeds is the old Denver City deed-record book kept by R. E. Whitsitt, the first entry in it being the copy of a deed from William Clancey to M. C. Fisher, dated May 11, 1859. On a "fly-leaf" of this book appears in Whitsitt's handwriting the subjoined entry which, it would seem, was placed there sometime in the summer of 1859. The appearance in these lists of the names of some of the "St. Charles" men will presently be accounted for:

"List of the Names of Stockholders in the Denver City Town Company.

Bassett, P. T.,
Blake, Chas. A.,
Brindell, W.,
Cobb, F. M.,
Churchill, John A.,
Clancey, William,
Courtwright, Richard,
Curtis, Samuel S.,
Dorsett, Folsom,
Dickson, T. C.,
Dudley, J. H.,
Fergonson, Levi,
French, A.,
Fuller, Geor. W.,
Hemmenway, S. O.,
Jewett, M. M.,
Kunkel, A. S.,
Lawrence, Chas. A.,
Larimer, Wm., Jr.,
Larimer, W. H. H.,
McDugall, George,
McGargill, James,
McCubben, J. L.,
McGaa, William,
Mitchell, David,
Nicholls, Chas.,
Parkinson, J. T.,
Peers, Phillip E.,
Rodgers, H.,
Russell, Wm. H.,
Reed, J. B.,
Smith, H. P. A.,
Smith, John S.,
Stout, E. P.,
Stevens, R. S.,
Totten, O. B.,
Wynkoop, E. W.,
Welton, N. H.,
Whitsitt, R. E.,
Williams, A. J.,
Walsh, H. S.,
Winchester, L. J."

With a few exceptions the names in Whitsitt's list of 1859 are the same as those in the assessment list. The record of the second assessment, made December 29, 1858, for two dollars on each share, shows John S. Smith to have transferred his share to Dr. A. S. Kunkle; and a few others appear to have later transferred theirs. "Adam" (Adnah) French, Frank M. Cobb, John A. Churchill and T. C. Dickson were at the time the first assessment was made, in Lawrence, Kansas, in utter ignorance that their town-site had been invaded and that they had been made shareholders in the new company. Their other associates, William Hartley and William Smith, appear to have been ignored at that time by the Denver City men. The record shows the assessments against French, Cobb, Churchill and Dickson, remained unpaid.

When Charles Nichols, the representative of the "St. Charles" town organizers, saw the new company in full possession of the town-site, he endeavored to save something from the wreck for his absent associates and other friends. To this end he made a bargain with the invaders in consequence of which the names of French, Cobb, Churchill and Dickson appeared in the list of shareholders. This agreement is further referred to in the following entry in the Denver Town Company's record. It is not dated, but it appears to have been made about the middle of December, 1858:

Richard E. Whitsitt (Deceased). (Photograph 1865.)

In obedience to instructions the Board of directors made and concluded a contract on the 4th day of Decr. with the following parties (see contract). This arrangement was made to carry out the previous contract made by Charles Nichols. The donations are as follows:

W. L. Perkins, 15 lots
Geo. W. Franz, 4 lots
Robt. R. Dumont, 4 lots
David Bliss, 4 lots
Jerry Sullivan (M. C. Fisher), 4 lots
James E. Latta, 4 lots
Leroy Hobbs, 4 lots
Benj. Franklin (M. C. Fisher), 2 lots
F. C. Orem, 4 lots
J. S. Lowry, 4 lots
John L. Banfill (M. C. Fisher), 4 lots
Edward Hay, 4 lots
J. H. Brewster, 4 lots
O. C. Baker, 4 lots
Daniel Long, 4 lots
H. Swigart, 4 lots
E. H. Warner, 4 lots
D. H. Stevens, 4 lots
James Kiem, 4 lots
D. McLaughlin, 4 lots.

These persons would seem to have been late arrivals, as their names, with the exception of that of Lowry, do not previously figure in the local annals of the closing months of that year. Having made this deal, Nichols had set out for Lawrence, Kansas, with his tale of woe to his "St. Charles" associates. He returned with the others the next spring and later engaged in mining. In the spring of 1862 he went back to his native place in Coshocton county, Ohio, entered the one Hundred and Eighty-third Regiment Ohio Volunteers as a Captain, and died in hospital at Clifton, Tennessee, in January, 1865. Although called "old Charley Nichols" by his acquaintances here, he was at his death only forty-two years of age.

Without date, but next following the foregoing entry, is one recording agreements made with a large number of persons, "to build Hewd log houses by the first of March next, with good roofs, not less than 16 feet square," on donated lots. As a rule each person was to receive two lots and to have the right to as many more when the company distributed lots in its "drawing." This list of names was evidently added to far into the next year, and it is in a badly kept condition; a fault which runs through the book, as in some places entries of transactions six months apart appear irregularly. Among the names of those thus entered are those of a few men who had arrived here prior to December 1st; the others are of men who appear to have been here in that month:

Samuel Mayer,
N. H. Rice,
W. Wallace Smith,
—— Roberts,
Rev. G. W. Fisher,
D. D. Cook,
J. T. Davis,
—— Parke,
F. H. Crouse,
Patrick McDonough,
Julius Smith,
Wm. Irish,
D. C. Collier,
Capt. W. G. Preston,
A. O. McGrew,
—— Wilson,
Wm. McDuff,
E. Karczewsky,
P. McPherson,
Daniel Knight,
James Knight,
J. R. Reedy,
W. A. Smith,
Frederick Howe,
Henry Murat,
S. B. Stagg,
Wm. J. Crawford,
George Abby,
Christian Kelber,
F. G. Wade,
C. M. Gilmore,
G. W. Peterson,
—— Waggoner.

Some of these names are so badly written that we are not sure that all in the foregoing are correctly given. As we have stated, the list is an extended one, but the larger portion of it was entered in the following year, when immigration set in with such a rush. Therefore we have not considered it necessary to present more of it.

The first record of a special donation, made December 9th, runs as follows; but the beneficiary was not the William Smith of the "St. Charles" Town Company:

"The Denver City Company have given the undersigned one lot 25 feet front on Larimer Street where the foundation is now laid between C & D Street South side and to also give him three more lots in the drawing of the company, for which said undersigned is to build a hewd log house 16 by 24 feet with pine roof, to be completed on or before the 1st day of April next, and further to give his influence to the town Company in the present survey as made by Curtis & Lowrie
9th Decb 1858 Wm A. Smith."

The streets indicated in the foregoing do not agree with the street designations later decided on, as C. and D. streets, according to the plat finished late in 1859, did not intersect Larimer street.

In what has been said in the preceding pages we have incorporated all details of interest appearing in the Denver Town Company's record up to the close of 1858; for others we have had to obtain information elsewhere.

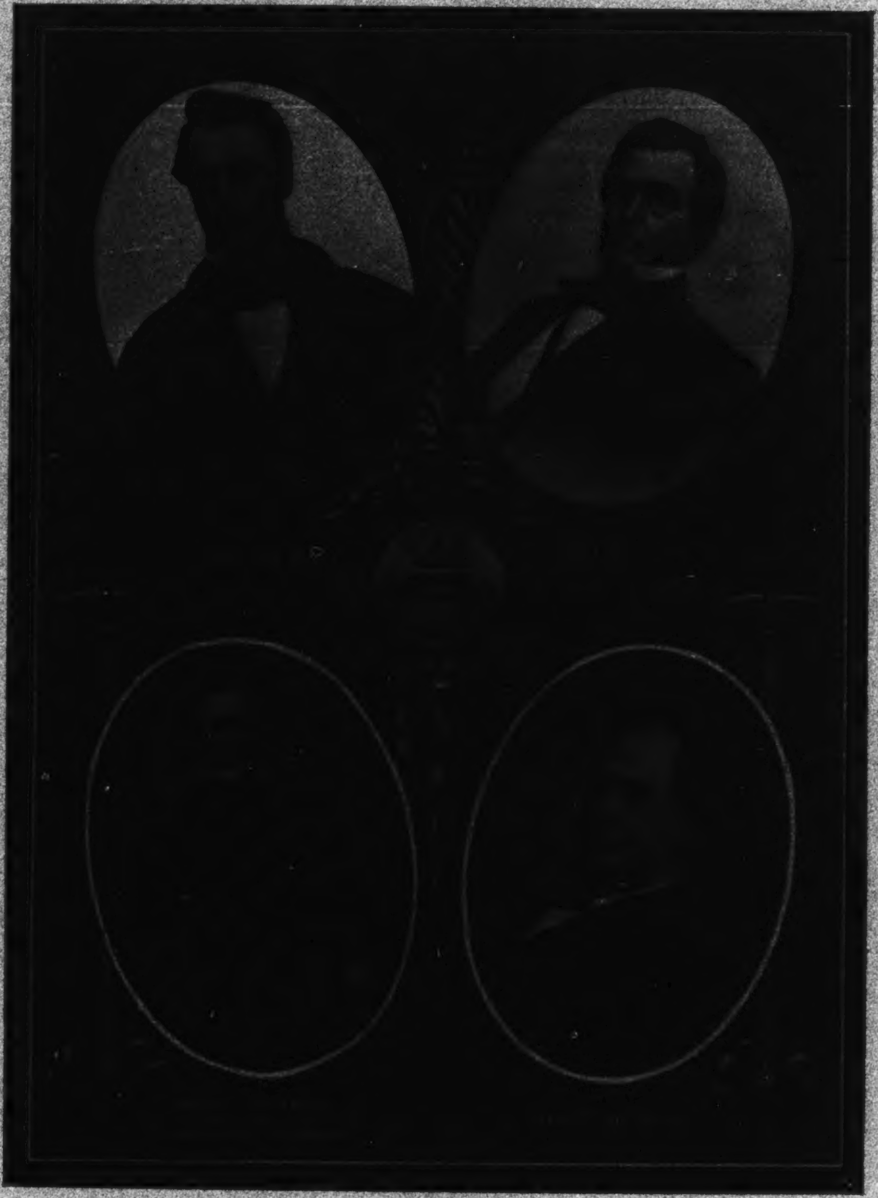
The name of the new company and the new city was bestowed in honor of Governor J. W. Denver, fifth Territorial Governor of Kansas, the organizers and promoters of the new enterprise having been his admirers and partisans, and three of them

---

General James William Denver, descendant of an old family the history of which would take us back to times preceding those of William the Conqueror, was born at Winchester, Virginia, October 23, 1817; his father having been Patrick Denver, who served as a Captain in the American army in the war of 1812. In 1830 Captain Denver removed to Ohio and settled on a farm near Wilmington, Clinton Co., where the subject of this sketch lived the life of a country boy until he attained his majority. He then went to Missouri, and after a short stay there, to Kentucky, where he became a school-teacher and law student. Later he entered the Cincinnati Law School from which he was graduated in the spring of 1844.

For a short time thereafter General Denver practiced law, and edited "The Thomas Jefferson," (a Democratic newspaper), at Xenia, Ohio, and then returned to Missouri, first locating at Plattsburg, and later at Platte City, where he remained practicing his profession until the outbreak of the war with Mexico. He recruited Company H, of the Twelfth United States Volunteer Infantry, and of which he was commissioned Captain, April 9, 1847; and served with distinction in General Scott's army and in all the battles in which it was engaged. After the war he returned to Platte City, where he bought and published the "Platte Argus" newspaper. His stay there was brief, for he became one of the California Argonauts in the spring of 1849, crossing the plains and thence by way of Salt Lake. Remaining in Sacramento until the spring of 1851, he then engaged in trading between Humboldt Bay and the mines. In 1852 he was elected to the California State Senate, and while a member of that body was placed by Governor Bigler in command of an expedition for relief of a large party of emigrants snow-bound and destitute in the Sierra Nevada mountains. Edward Gilbert, editor of the "Alta California," editorially criticised the Governor's preliminary management of the expedition, and General Denver became involved in the controversy. Gilbert challenged Denver and in the encounter rifles were used—weapons with the use of which Gilbert ranked as an expert. After the first fire, Denver, who had discharged his rifle into the air and had been unharmed by his adversary, expressed a willingness to shake hands with Gilbert. But the latter was hot-headed, and apparently desired and intended to kill General Denver. At the second fire Gilbert, who was an able and brilliant man, fell a victim to his wounded pride.

Public opinion unanimously sustained Denver in the part he bore in the unhappy affair. The General successfully led the expedition to the relief of the emigrants, and in the spring of 1853 was elected Secretary of State, a position he filled until the autumn of 1855. In the autumn of 1854 he had been elected by the Democratic party to the Thirty-fourth Congress, the first session of which began in December, 1855, and of which Denver became a prominent and useful member. As Chairman of the Select Committee on Pacific Rail-



Four Portraits of General James W. Denver.

came here armed with commissions as county officers which bore his signature. For a great city to bear the name of an individual is a rare distinction. Washington, D. C.; Cleveland, Ohio—so called for General Moses Cleveland, of Connecticut; and Denver are the conspicuous ones in our country named for native Americans. The founders of Denver builded better than they knew, for it is not likely the visions of their wildest dreams ever pictured anything approaching the reality that is before us now. "Denver City" was in fact, a little frontier business enterprise in real estate, and was the first distinctive, successful movement of that kind on the South Platte; the Aurarian proceedings having had more of the brotherly love element in them.

Several lots were reserved by the Denver Town Company as gifts to the city's namesake, but it was not until 1882 that General Denver made his first and only visit to the city, and in the meantime he had given them no thought if, indeed, he had not forgotten that he ever had any claims upon such possessions. In the confusion of titles which occurred in the "Sixties" the lots intended for him were acquired by others, and their original assignment was overlooked or disregarded. In 1882 General Denver found that they had long before passed to innocent purchasers and, therefore, not caring to raise the question of title, he abandoned any claims he may have had upon them.

As with Auraria, there was delay in getting Denver City fully surveyed and platted. Curtis and Lowry whom the directors had engaged to survey and plat three hundred and twenty acres of the town-site, after they had located Larimer street, did not make satisfactory progress with their work. At a meeting of the Directors held January 22, 1859, the contract with Curtis and Lowry was cancelled and the work stopped until early in the following summer, when, on June 6th, E. D. Boyd was engaged to finish the survey, and plat the entire claim of the Denver City people, starting where his predecessors had stopped. A. J. Williams, of Blake & Williams, and William H. H. Larimer, carried the chain on a large part of the work. By that time it had become necessary to have the survey quickly and accurately completed. It was this actual survey in detail that was held to constitute the new company's chief binding claim upon the land, and which, in connection with its aggressive possession, and improvements, made a stronger and more defensible title to it than any the "St. Charles" people could set up against it.

Of one of the preliminary surveys Mr. E. P. Stout wrote us:

"I arrived in Denver, or at that time the mouth of Cherry creek, from Omaha on October 26, 1858, and a few days after, with the use of a pocket compass taken with me across the plains, laid out, or rather, staked off, the town site of Denver together with five or six other parties, among whom were John S. Smith and William McGaa, Indian traders."

This indicates that Mr. Stout had his plans

---

road he reported a bill providing for the construction of three trans-continental lines; but a majority in Congress was against so wild a proposition as building even one at that time appeared to be.

Denver did not seek a re-nomination for Congress. At the close of his term he was appointed Commissioner of Indian Affairs, a position he was very capably filling when, in 1857, President Buchanan requested him to take charge of the strife-torn Territory of Kansas. Denver reluctantly entered upon his duties as Governor of Kansas Territory in December, 1857, and determined to hold aloof from all factions and do his duty as the law and his conscience directed him. The stormy events in Kansas in the years 1857-58 are familiar parts of National and Kansas history and need not be recounted here. Denver continued in his difficult and trying position until October 10, 1858, when he resigned; one of his closing official acts having been to commission the three "officers" for Arapahoe county, as elsewhere related. But in the meantime he had won the respect, esteem and confidence of all the factions, and had brought peace to the distracted Territory.

General Denver returned to Washington and resumed his former position as Commissioner of Indian Affairs in which he served until March 11, 1859, when he resigned and returned to California. There he became a candidate for United States Senator, but was defeated by two votes. Remaining in California until the outbreak of the civil war, he warmly espoused the Union cause. Without solicitation, President Lincoln on August 14, 1861, appointed him a Brigadier General of Volunteers, and he was placed in command of all the troops in Kansas to preserve peace on the border. He was soon transferred to a more active field. Placed in command of the Third Brigade of Sherman's Division, Army of the Tennessee, he ably participated in all the operations of that historic organization until April, 1863, when he resigned in consequence of an emergency in his private business affairs that compelled his resignation.

Subsequently General Denver engaged in law practice in Washington, having established his home at Wilmington, Ohio, where his boyhood years had been passed. In 1876 and again in 1884 his name was prominent among those of men mentioned as acceptable as the Democratic candidate for President. Six feet, two inches in height, of fine proportions, he was a man of commanding presence. Genial, dignified and urbane, he possessed peculiarly winning ways and the faculty of making men his loyal and enduring friends. He died at Washington on August 9, 1892, and is buried at Wilmington.

The foregoing is but the briefest outline of the brilliant career of the man whose name is borne by this metropolis of the Rocky Mountain country. To the writer there seems to be much in the life-history of General Denver to make his name especially fitting to the city founded here by Colorado's pioneers in 1858. J. C. S.

made for utilizing the site of "St. Charles" before the arrival of General Larimer's party, with which he at once became associated.

In the meantime French and his comrades had continued on their journey, and when they got home immediately gave the affairs of "St. Charles" the attention needed at that end of the line, in accordance with their plans when they left here. On November 15th, two days before their town-site was "jumped" by the founders of Denver City, their record states that they held a meeting at Lawrence at which they devised plans for apportioning most of their town lots among the members of the company according to the plat Hartley was to prepare from the notes of his survey. The record of this meeting is as follows:

"At a meeting of the Association held in Lawrence K. Ter. Nov. 15th 1858 the following business was transacted the meeting was called to order by the President, and upon motion of Mr. Hartley the following plan of distribution for the town lots was adopted. to wit. The names of the members to be first written down on paper. then commencing with the first name, place the first numbered lot opposite & proceed in like manner until a lot shall stand opposite the name of each member, when again commencing at the first written name. place opposite the next lot in rotation, and proceed in the same manner until the whole number of disposable lots shall have been distributed"

"No other business being presented, the meeting adjourned"

After this meeting the Lawrence men busied themselves in attending to the various details of their preparations, with which they thought they were getting along finely. They remained several weeks in ignorance of what had happened here, and it was not until Nichols appeared that they were first apprised of the misfortune that had befallen "St. Charles."

The "St. Charles" was the only one of the pioneer Town Companies at Cherry creek that was incorporated; but that availed it naught. A few days after the Denver City Town Company was organized on November 22nd, E. W. Wynkoop, the "Sheriff," was sent back to the capital of Kansas Territory to have the new company properly and legally incorporated, to have stock certificates printed and to procure such other things as a town corporation would need in its business. When he arrived there he found the Lawrence men had a bill pending to incorporate "St. Charles." Wynkoop procured assistance and vigorously endeavored to have the "Denver City" bill substituted for the other, but in vain. The Lawrence men succeeded in convincing the Legislators that they had been first on the ground, that they had organized themselves, surveyed the land, and intended to establish a town on it; and that Wynkoop and his associates had come in in the meantime and "jumped" the town-site. When Wynkoop saw that he could not get the "Denver City" bill converted into a law, he proposed peace and persuaded the "St. Charles" men to admit General William Larimer, Jr., Charles Lawrence, and himself into the "St. Charles" close corporation. Prior to this, Charles Nichols had put in an appearance, and reported what had happened to the "St. Charles" town-site and also the agreement he had been forced to make with the invaders. Under these circumstances, in their anxiety to get their bill through, and knowing that they could among themselves control the organization, the "St. Charles" men consented, and admitted Wynkoop, Lawrence and Larimer, though the latter two were not present; Wynkoop speaking for them and urging their desirability as members of the "St. Charles" Town Company. So, the following was enacted by the Territorial Legislature and became a law on February 11, 1859:

AN ACT Incorporating the St. Charles Town Company.

Be it enacted by the Governor and Legislative Assembly of the Territory of Kansas:

Section 1. That Adnah French, Wm. McGall, Theodore C. Dixon, Frank M. Cobb, Charles Nichols, Edward W. Wynkoop, William Larimer, jr., Chas. Lawrence, William Hartley, jr., Loyd Nichols, and their associates and successors, are hereby constituted a body corporate and politic, under the name and style of the "St. Charles Town Company," and by that name and style, shall be competent to make contracts, sue and be sued, plead and be impleaded in all matters whatsoever. Said Company is authorized to have and use a common seal, and change the same at pleasure, and to make such by-laws as may be necessary for the government of said company and the management of its affairs.

Sec. 2. The corporation hereby created, shall have power to purchase hold and enter, by preemption or otherwise, any quantity of land not exceeding nine hundred and sixty acres, where the town of St. Charles is now located, as surveyed by William Hartley, being on the east of Cherry Creek, in Montana county, Kansas Territory, and to lay off the same into streets, blocks and lots, and convey the same, by deed or otherwise.

Sec. 3. The said company shall have power to pass by-laws providing for the election of such officers at such time or times as may be necessary to carry out the business of said company; and all conveyances of real estate of said company, shall be signed by such officers of said company as said by-laws shall designate, which conveyances shall be duly executed and acknowledged, and, when so executed and acknowledged, shall be deemed good and valid conveyances.

Sec. 4. The stock of said company shall be deemed personal property and the company may, by by-laws, prescribe rules for the issuing and transferring of said stock by each individual stockholder.

Sec. 5. That said company shall, also, have power to maintain courses, sluices, ditches and other contrivances for conducting water from

Cherry Creek and the South Platte to be used for mining purposes, and may sell and dispose of interests in the same. Said water privileges are only granted on lands held by the company.

A. LARZALERE,
Speaker of House of Representative.
C. W. BABCOCK,
President of the Council.

Approved February 11, 1859.
S. MEDARY,
Governor.

In a statement Colonel T. C. Dickson recently made to the writer, and concerning this admission of General Larimer, Lawrence and Wynkoop, he said that if he and his associates had better understood the whole situation and had fully known the Denver City Town Company's plans and purposes, they would not have thus fraternized in their "charter" with the three Denver City men. He also said that it was the understanding with Wynkoop that nothing of consequence was to be done on the "St. Charles" town-site until after the return of the "St. Charles" men to Cherry creek late in the spring of that year. Wynkoop started back to Cherry creek soon after the enactment of the "St. Charles" incorporation, and the "St. Charles" men did not see him again until after their return here in the following June.

Loyd Nichols, named in the act as one of the incorporators, was not at Cherry creek in 1858. He was a brother of Charles Nichols, and was in eastern Kansas in the winter of 1858-59. After the "St. Charles" promoters returned to Lawrence in November of that year, they placed his name on the original "constitution" that had been signed here in the previous September; and this accounts for its presence in the copy of the "St. Charles" record in possession of our Historical Society. They also made him, as stated in the act, one of the "St. Charles" incorporators. He did not figure here in pioneer times. Late in the "Sixties" he came here to look after the property interests of his then deceased brother, but we did not learn that he ever became a citizen of Colorado. It may be remarked, in passing, that Charles Nichols' property had been in the later period the object of proceedings most discreditable and that diverted it to those having no just claim upon it.

As the reader will have learned, Wynkoop's failure to get a "charter" for the Denver City Town Company from the Kansas Legislature that winter did not in the least deter the "Denver City" people from going ahead with their town and their plans. The company was never incorporated. E. P. Stout says he and his associates talked afterward about getting a "charter" at the next session of the Territorial Legislature, but when the time came nothing was done about it.

President French and his associates remained at Lawrence and did not return here until the following June, when the excitement over the gold discoveries by Gregory and Jackson was at its height, and when surveyor Boyd was engaged in finishing the survey and platting of Denver City. They found the invaders in full possession of their town-site, and as they had approached it in the last stage of their journey they could hardly believe their eyes. Instead of the unoccupied land they had left they saw a busy town crowded with excited people, with hundreds more streaming in every day.

Of course, there was an outcry and a protest against the acts of the Denver City people, but the fact that "St. Charles" had disappeared could not be disputed; nor was there any available remedy. But the "St. Charles" people did not immediately abandon their organization, though there would seem to have been little utility in maintaining it. It appears that they kept it alive until the following autumn, when, on October 24th, Adnah French resigned as President and John A. Churchill was elected to succeed him. The minutes of this meeting, which constitute the last entry in their record book, and terminate their recorded history of "St. Charles," read as follows:

Nichols' Unfinished Cabin.

October 24th 1859

"At a meeting of the St. Charles Company held on the Town Site, the meeting was duly called to order by the President. On motion Mr. Cobb was chosen Secretary to act at said meeting in the absence of Mr. Dickson. Mr. French then handed in his resignation as President of the Company. On motion of Mr. Nichols Mr. Churchill was chosen President (pro tem) until an election Should be held. The members then proceeded to ballot for President Mr. Churchill having received a majority of all the votes cast was declared elected. no other business being presented the meeting adjourned."

The progressive men who had "jumped" the town-site, had, as we have stated, considerately reserved under their bargain with Nichols, some shares in the Denver Town Company for the absent promoters of "St. Charles," and these were finally accepted by French and his immediate associates who had borne the burden of trouble and expense growing out of their unlucky undertaking. Of the circumstances leading up to this arrangement Frank M. Cobb has given us the following account:

> "We returned to the mouth of Cherry creek in June, 1859. The members of the St. Charles Town Company, with two exceptions, did not have the nerve and courage to fight for their rights under their charter, and the St. Charles Town Company soon ceased to exist, nearly all of its members becoming merged into the Denver City Town Company. I became owner of 130 of the lots but lost title to 92 of them. Some of the others I sold or traded off before I left, and the rest I sold at what I thought fair prices when I returned after the war."

Among the preparations for business made by the "St. Charles" men after their return to Lawrence, in addition to application for a "charter" for their company, was the printing of stock, or lot, certificates, some of which they at once filled out for themselves and for Nichols, Smith, and McGaa; believing the last-named two to be loyally identified with their enterprise. They had desired to specially recognize the prominence and utility of William McGaa, and the irony of fate led them to prepare for him as a shareholder in the "St. Charles" Town Company, certificate Number One, dated at Lawrence, Kansas, December 1, 1858. Their plan for dividing their lots resulted in assigning to him Lot Number One in Block Number One, beside others, according to a plat they had made from Hartley's survey; thus giving him the honor of first place in the real estate records of their corporation.

The projectors of "St. Charles" have been unjustly accused of having been slip-shod and inefficient in their methods. They undertook to follow about the same lines on which Auraria City and Denver City were afterward successfully organized, though they allowed themselves much more time than their competitors expended. Their outline survey of their land, which did not definitely locate streets or lots, and their failure to make any proper structural improvement, exposed them to attack; though nobody could then obtain legal title to land in this part of the country. But it is doubtful if a good tenanted cabin on their land would have held it against the Leavenworth men. The great blunder made by the Lawrence men was that of going away for the winter, as the two outsiders they had admitted to fellowship did not, as we have seen, prove loyal to the pioneer town enterprise to the welfare of which they were supposed to have been primarily committed. Though Nichols would appear to have had the harder time in connection with the undertaking, T. C. Dickson, Adnah French, and Frank M. Cobb were the men who conceived it. French, who originally came from Brandon, Vermont, died poor in Santa Fe in 1872.

McGaa, as the reader will have noticed, figured prominently in the organization of each of these Cherry creek town companies. He was a smart, fairly educated man, and represented that he was a son of an English Baronet. Charles G. Chever, who knew him well, said McGaa was a Scotchman, had been a sailor and drifted across the country to these plains from the Pacific coast. George R. Brown, a son of McGaa's widow by her second husband, and who is now an United States Indian Trader at Rosebud Agency, South Dakota, in response to inquiries from the writer, said:

> "McGaa was the son of an English nobleman, and when quite a young man ran away from his home. Later he wanted to return to his parents, but his father thought he had by his conduct disgraced the family. So McGaa set out for America and finally made his way into the far west."

William H. H. Larimer.
(From a recent photograph.)

McGaa professed great friendship and admiration for Governor Denver, and as one of the organizers and officers of the Denver Town Company claimed to have been one of those who urged and decided that the company and town be named for the Governor, and that the latter be presented with a share in it. But it was not as an organizer of the town companies that he derived his greater pioneer distinction here. That fame grew out of his paternal relation to the first child born on the site of Denver, not considering exclusively Indian products. He loyally named his son William Denver McGaa.

McGaa, like several other men conspicuously identified with the pioneer town companies, did not long remain here. In the spring of 1861, with his wife and little son, he located at Laporte, near the present city of Fort Collins, and at which place he made his home until his death. The Denver Town Company had named one of its streets for him, but in 1866, after he had fallen into very dissipated habits and lost most of his earlier standing, the street's name was changed to that of Holladay, in honor of Ben Holladay, of overland stage-line fame. McGaa had frequently come to Denver from Laporte, and after the street name was changed he grieved over the rebuke implied by the change; and this, it was believed, accelerated his downward career. Upon one of his visits here, in the summer of 1868, he drank heavily, and was placed in the town prison to recuperate. The prison was a miserable, unventilated old building, and McGaa, who was then about forty-five years old, died in it during the following night. Charles G. Chever said it was the common belief at that time, that McGaa died from suffocation in the little box-cell in which he had been placed. So ended the life of Denver's most picturesque pioneer.

Charles A. Lawrence (Deceased).
(From an old "card" photograph.)

McGaa was usually called "Jack Jones" by his associates and other acquaintances here. Mr. Brown has given us the following explanation of the origin of that nickname, or alias; but as an offset to this statement all of the surviving pioneers of 1858 say McGaa was known here as "Jack Jones" from the beginning of the Denver settlements:

"After McGaa became prominent in the organization of the Denver towns and had acquired, as he supposed, considerable real estate, he thought it a capital idea to write home to learn if his parents were still living and to let them know how he was prospering in America. The letter was written on the printed letter paper of a prominent Denver business firm, and was to this effect: 'There is a bright young man in my employment here who says he is your son. I have tried to get him to write to you, and as he seems determined not to do it, I concluded I would write myself and let you know his whereabouts.' McGaa signed this letter 'Jack Jones.' In due time came a reply from England from John McGaa urging 'Jack Jones' to persuade the young man to return home, as he would soon inherit the property of his parents, who were growing old and wanted to see him again. 'Jack Jones' was invited to accompany the young man to England where, the elder McGaa said, neither would ever want for anything. Dominic Bray, now at this Agency [Rosebud, S. D.] read 'Jack Jones'' letter and John McGaa's reply to it, Bray having been in Denver at that time."

The pioneer town of Highland across the Platte and opposite the towns of Auraria City and Denver City, was a different enterprise from the later independent village of Highlands which was subsequently annexed to the city. Old Highland has little historical record and affords meager material for the local historian. Exact dates and precise details are lacking because of the absence of the Highland Town Company's records, if there ever were any. If they survive, their whereabouts are unknown. Of the enterprise Dr. L. J. Russell says:

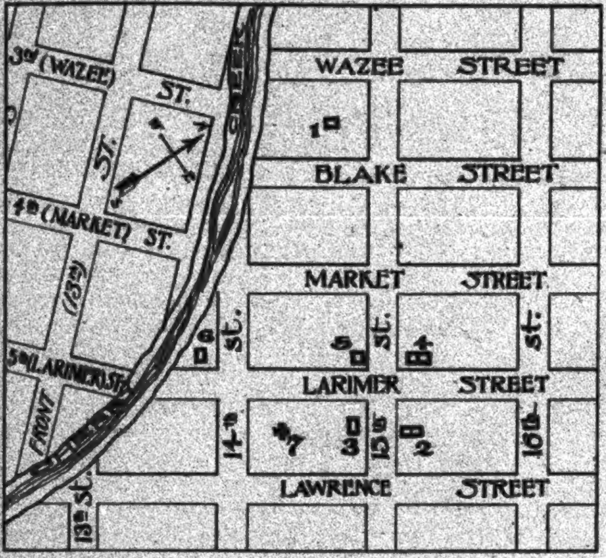
"The City of Highland, or the Highland Town Company, across the Platte, was organized in the summer or early in the fall of 1859. Henry Allen, W. M. Slaughter, W. D. McLain, myself and some dozen or two others constituted the company. We did not attempt to incorporate it. Some portion, if not all, of the site was surveyed and staked off, and a 'claim' was filed, or was to be filed, in the Kansas Land Office, but whether we heard from it or not I do not now recall. We didn't count much on Highland at that time."

To introduce Highland at this point is somewhat out of chronological order, but probably it does not matter, as we are now dealing with pioneer towns. A majority of those identified with Highland were Auraria City men, the names given certain of its streets indicating who some of them were — Byers, Foster, Pollock, Wing, Wooton, Wallingford, and Murphy. But the old streets and their names mostly disappeared long ago. Henry Allen was elected President of the company, and William M. Slaughter, Secretary. The plat of the town appears on our reproduction of the Fosdick and Tappan map published late in 1859, but all the streets and lots were not actually staked out. That side of the Platte attracted no attention in 1858, and hardly any in 1859. Of its condition in those times, E. P. Stout says:

"So far as I can remember there was not a single 'improvement' in 1858 on what was afterward called Highland, across the Platte from 'Denver City.' A town was surveyed there, or partly so, by the 'Highland Town Company' in 1859, but I never paid much attention to the parties who were in it. I am quite confident that there was not a shanty built on their town-site as late as the fall of 1859, though I think there were two or three farther out."

After the gold discoveries in 1859 some of the immigrants, on their way to the mountains camped there, but the Highland Town Company did not succeed in making their speculative enterprise a successful one. The site was a fine one on account of its elevation, and topographically very attractive, but it was several years before the locality really had the beginning of its present development.

In pioneer Highland there was no such competition for settlers who would build, no contention with its neighbors, and no jealousies and animosities, such as characterized Auraria and Denver for a year or so. One reason for this may have been because its projectors and sponsors were all residents and interested partisans of Auraria, or Denver City. Indeed, Highland may be said to have had no strictly pioneer history of its own; as it was in 1859, and in 1860, too, not much more than a silent spectator of the activity and strife present on the opposite side of the Platte. Its primitive history consists nearly altogether of events happening among its neighbors on the banks of Cherry creek. Further along in our narrative some account will be given of its development.



Map showing locations of pioneer structures on eastside of Cherry creek—Denver City. (1, Nichols' unfinished cabin; 2, the Moyne and Rice cabin; 3, Larimer cabin; 4, Lawrence and Dorsett; 5, Hickory Rogers; 6, E. P. Stout. Figure 7 marks the spot where the St. Charles men started their survey where the first town-site stake on the site of Denver was driven.)

When he published his book, "Army Life on the Border," in 1866, Captain Marcy had become a Colonel in the United States army. He was then inclined to the belief that the delay of his command at the mouth of Cherry creek, in the early days of May, 1858, was incidentally influential in the founding of Denver. Referring to his man who washed out some gold in the creek at that time, he said:

> "Soon afterward he was discharged and went to St. Louis, and in a short time the miners commenced flocking to the locality, and laid out a town which has continued to flourish ever since, and at this time contains several thousand inhabitants. It is called 'Denver City,' and I feel quite confident that the representations made by our discharged teamster in St. Louis and other places, were the origin of the location and establishment of a new city and Territory."

Unfortunately for the Colonel's theory, the pioneer parties of miners, or prospective miners, had started, or were preparing to start, across the plains on their way to this locality to dig for gold, before his later dismissed teamster had found anything of value in Cherry creek.

The teamster who washed out that gold, George Simpson, had then been in this part of the country several years. Later he became a trader and stock raiser, having settled on a ranche near Trinidad, where he died some twelve or fifteen years ago. In compliance with his last request, his body was buried on the top of a butte or small mountain near by, and which then received its present name, "Simpson's Rest."

In the autumn of 1858 the foot-hills, gulches and mountain slopes around here were thickly overgrown by the native forests. The trees were pine, spruce, and balsam fir, with some aspens scattered among them. They were not of a size to be called monarchs of the forest, but were of fair proportions. The South Platte and its tributaries were fringed with cottonwoods and willows, and altogether the local landscapes were most pleasing to the eye. The settlements at Cherry creek and the subsequent mining operations were followed by great havoc in the timbered areas. Logs for cabin-building and wood for fuel called for the destruction of many trees, and when the saw-mills got to work among them, trying to supply the insatiable demands for timber and lumber for building and mining purposes, the forests were eaten away with amazing rapidity, the growths of centuries disappearing in a few years, leaving the country around Denver in its present comparatively deforested condition. The inroads made the first autumn and winter for cabin-building material and for the huge wood-piles thought necessary for the fuel supply, made large openings in the standing timber in the general vicinity of the towns.

When the Auraria and Denver City Town Companies were organized, the pioneers who were sojourning at "Montana" began to lose faith in the future prospects of their little hamlet. Before winter set in about half of them had moved themselves down here, most of those who made the change that autumn becoming members of the Auraria Town Company. They also moved the useful material of their "Montana" cabins and used it in building houses here. In the following spring the rest of the Montanians came to Auraria and Denver City, leaving their town-site to revert to a state of nature, and their town of some seven months' antiquity to become a historical memory. That is all it is to-day, for in a few years not a vestige of it remained to show that once there had been a little frontier "city" there.

CHAPTER XXIII.

"First" House-Building—Some of the "Early Settlers"—Pioneer Street Names—First Cabin—Other Early Builders in "Auraria City"—Beginnings of "Denver City"—Its First Cabin, and Subsequent Pioneer Improvements—Mercantile Pioneers—First Christmas Celebration at Cherry Creek—First Masonic Meeting—First Clergyman—Pioneer Women—Rivalry Between the Two Towns—Condition at Close of 1858—Their Common Heritage.

Over the question of who was entitled to the honor or credit—or both—of having "built the first house in Denver" there have heretofore been many controversies and other manifestations of divided opinion. In the history of most cities, especially of those which had a rapid development, there is usually some conflict of claims to this distinction. It is not strange, therefore, that here, where the initial circumstances were so extraordinary, and where the developments have been so amazing, there should have been a little of such confusion in reminiscences of the first house-building in the feverish days when the foundations of Denver were laid.

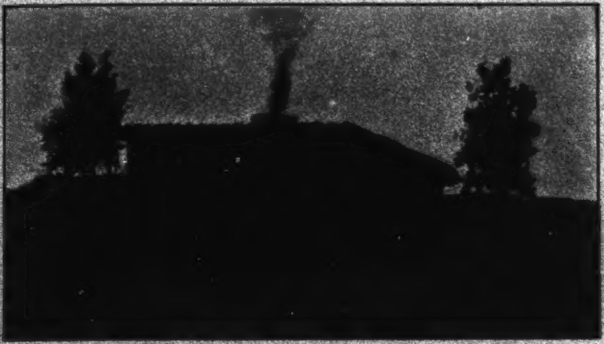
This uncertainty has attached to the beginning of both Auraria City and Denver City, but with the new light that may be thrown upon the subject by the circumstantial details we have fortunately been enabled to present in this volume, perhaps a satisfactory and accurate conclusion may be reached by the reader.

It has frequently been stated that the Indian trader, John S. Smith, was the first "settler" at the mouth of Cherry creek. We have shown how he came to "settle" here. It was not in consequence of his identification with "St. Charles;" and as an associate of "the Russell boys" he was no more the "first" one here than any other member of that company. Notwithstanding his connection with pioneer "St. Charles," and with the other two town companies, he can hardly be said to have at any time been here with the intentions of a settler. Had it not been for the extraordinary circumstances due to the intentions and determination of others, the objects and incidents of his roving and preferred occupation would have required him to move on again in the following spring. His business involved directly neither gold-digging, "settling," farming, nor town-building. So, to the many distinguished achievements of John Smith, that of having been Denver's first settler may not be added.

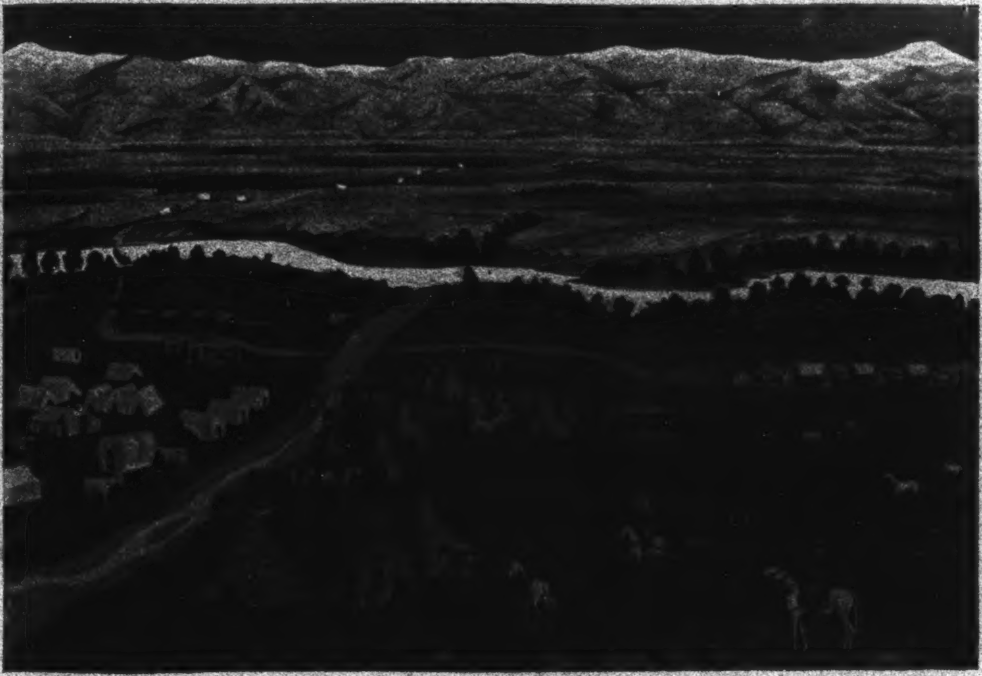
An outline of Smith's career before his coming to Cherry creek in the autumn of 1858, has already been given. After the business of the American Fur Company, as an employee of which corporation he came into the west when quite young, declined, he lived with the Indians. Later he began business as a trader and in which he was engaged when our pioneers first encountered him. He was then between fifty and sixty years old and, of course, was called "Old John." He had a good-looking, though somewhat portly, Sioux squaw for a wife, named Wa-po-la, and the two had a full-grown son, who also put in here in October, 1858. "Old John" remained here until 1860, when he went down on the Arkansas. Later he was interpreter for Chivington in the Sand creek campaign. At that time "young John" was associating with the Indians and was with the Cheyennes at Sand creek. He managed to slip away and get among Chivington's troops after the fight. When he was discovered he was shot and killed by one of the soldiers, who was said to have long had a grudge against him. After the Sand creek affair "Old John" went away again and resumed his roving life, as he was in his ways about as much Indian as white man. In later years a report reached Denver that he had died in 1871 or 1872 somewhere in the northern country, but no one knew just where. Wa-po-la survives and is with her tribal people in South Dakota.

There were several other frontiersmen with their Indian wives camped at the mouth of Cherry creek late in the autumn of 1858, but they were migratory and had little or no identity with the settlements. One was William Rowland, a white man whose wife was a Cheyenne; both are now living in South Dakota. Another was Jose Merrival, a Mexican, whose wife was a Sioux Indian woman; he is dead but she is living. A third pair consisted of William Simanole, a Sioux half-breed, and his Sioux wife. They are now in South Dakota. Still another was Alphonse La Rocque, a Frenchman, with his Sioux wife, to whom we shall again refer.

Then, there was that shifty pioneer, William McGaa. His son, William Denver McGaa, who said he derived his information from his mother, informed us that this picturesque pioneer of Denver had been in the Rocky Mountain country "a number of years" before this city was founded; but, a year or so before that event had met and married a handsome young half-blood Sioux, of which proceedings the son was one of the consequences. Some further details of this pioneer Denver family will appear on succeeding pages.



William McGaa's Cabin.
(From a sketch by the late Judson H. Dudley.)



Primitive conditions at the mouth of Cherry creek.
(From an old drawing purporting to represent "Denver in 1859." Its only value is in its topographical suggestiveness and its hints of what were general conditions early in November, 1858; many details of the latter being wholly inaccurate.)

After his participation in the organization of the "St. Charles" company McGaa retired from the mouth of Cherry creek and did not again appear here until the latter part of October when, according to Dr. Russell and others, "he came in from somewhere down about St. Vrain's," with his wife, and with a group of Indians trailing after him. Soon thereafter he built a "shack" or picket cabin on the bank of the Platte, in Auraria, and which constituted part of "Indian Row." He finished it just before "the Leavenworth men" arrived, in the meantime occupying a tepee, or wigwam. His "lodge," as he called it, was of two rooms, made of posts or pickets set upright in the ground, and stood next to the Russell-Smith establishment. It was "chinked" with mud, had a thatch and earth roof, a chimney and fireplace. The interior walls of the house were hung, and the earth floors strewn, with pelts and robes; and altogether it was not an uninviting domicile.

To return for a moment to the question of Denver's "first settler," it is to be said that there is no definite basis from which to point out any individual as having had that distinction. It is apparent that "the Russell boys" who came in with John Smith to build the double cabin did not come as settlers. They then expected to move on when spring opened. While the way is not entirely clear to a conclusion, it would seem that Major D. C. Oakes' 10th of October party might be considered as the first group of "settlers" on the site of Denver. But none of the first half-dozen cabins built was put up by any member of that party.

It is to be remembered that these pioneer immigrants of that autumn of 1858, "camped out;" that those who had no tents found shelter, when it was needed, in their canvas-covered wagons; and the few that had neither tents nor wagons made fair shift to live in the open, awake or asleep, and were little the worse for it. The founders of Denver had choice of these three ways until they had provided themselves with other and more substantial accommodations. Cabin-building was not a difficult task, as plenty of logs of suitable size could easily be obtained from the adjacent timber which lined the streams.

Inasmuch as the street names and designations in the old Auraria district were all changed in later years, the subject matter of much of this chapter will be more readily understood by remembering these changes on that side of Cherry creek, which are stated in the following:

Old 1st street is now Wewatta.
Old 2nd street is now Wynkoop.
Old 3rd street is now Wazee.
Old 4th street is now Market.
Old 5th street is now Larimer.
Old 6th street is now Lawrence.
Old 7th street is now Curtis.
Old 8th street is now Champa.
Old 9th street is now Stout.
Old Front street is now Thirteenth.
Old Cherry street is now Twelfth.
Old Ferry street is now Eleventh.
Old St. Louis street is now Tenth.
Old Cheyenne street is now Ninth.
Old Arapahoe street is now Eighth.
Old Washington street is now Seventh.
Old Adams street is now Sixth.
Old Jefferson street is now Fifth.

On the eastward side of the creek the changes were not so many, the present numbered streets having been designated by the letters of the alphabet, and their cross streets by names which have mostly been retained. Much detail relative to the original plats and street arrangements in the several towns will be found in another chapter. For convenience in designating the locations of pioneer structures we will assume that the present Larimer and parallel streets run east and west, and the present numbered streets in the old part of the city, north and south. We will ask the reader to bear in mind that all locations of the pioneer structures mentioned in this and succeeding chapters are stated according to the present names of streets.

It has been in dealing with the pioneer improvements that the controversies have been waged these many years, and apparently without any good reason. The beginning was made in Auraria City; and of the beginning, Dr. Russell who, more than any other one man, was the founder of that "city," and who was Secretary of its Town Company in the beginning and for a year afterward, states:

> "Beyond the shadow of a doubt the first cabin erected at the mouth of Cherry creek was that double log-house jointly put up by "the Russell boys" and trader John Smith in the first and second weeks of October, 1858. This is as certain as it is that W. Green Russell and his party went from Georgia to the Pike's Peak country in 1858! The next cabin built and occupied was Hutchinson's [Hutchins'] and Easter's, and after that were Rooker's, Barker's, Henry Allen's, Sagendorf's, and then a number of others all pretty much at the same time, for I do not recall the exact order of their building. I built a separate one for myself early in November. The cabins all went up rapidly while the logs were convenient at hand."

The Hutchins and Easter Cabin.
(From a drawing by John Easter.)

Several October pioneers are recorded as having said that upon their arrival here they camped at "Smith's ranche." But as the Russell-Smith double cabin was put up as winter quarters by its builders who did not anticipate that it would, that autumn, become the nucleus of a town, and who expected to go forth the next spring undetermined as to where their next stopping place would be, it can only in relation to ensuing events be regarded as the actual beginning of Denver. It preceded all immediate prospects for establishing a town at the mouth of Cherry creek, and as the pioneer cabin on the site of Denver its position in our local history is unquestionable; for the "St. Charles" proposition, as a building enterprise, depended upon future developments.

Roswell Hutchins and John Easter, who were of the Lawrence party, and who had been at "Montana," where Easter had built a cabin, came here immediately after the arrival of the Oakes party. As soon as the camp talk turned to the conclusion to organize a town company and lay out a town, they began cutting and preparing logs for a cabin which they erected on what became the east side of Twelfth street, between Wazee and Wynkoop streets. Giles Blood, Joseph Brown, William Regan, and James White jointly started one a few days later, and when the survey was finished it was found that these men in their hurry had got their cabin on the line of Twelfth street between Wazee and Wynkoop; from which site it was later removed. Much of the ground in that neighborhood is now covered by railroad tracks. The formal organization of the Auraria Town Company was not completed until November 6th and, therefore, the pioneer "Auraria City" could be technically said not to have existed before that date.

Judson H. Dudley's Cabin.
(From his drawing.)

Dr. Russell, as we have seen, says Hutchins and Easter were the first to build after a town had been decided on—the first of the town's builders. Mr. W. N. Byers, who, though a later comer, took pains to acquaint himself with these historical details soon after his arrival, says he was repeatedly told that Hutchins and Easter built the first cabin erected on the site of Denver after it was determined to locate a town here. Andrew Sagendorf and E. A. Willoughby, each of whom, with their partners, built cabins in November of that year, confirm the priority of the Hutchins-Easter cabin, both as to completion and occupation about the first of November; making it the second completed structure on the ground. The late Judson H. Dudley, who was at that time Vice President of the Auraria Town Company, said that while a written record would usually be considered fairly conclusive, anything contrary to the foregoing would not state a fact. W. G. M. Stone in a little pamphlet published several years ago containing some of Denver's pioneer historical data, says Hutchins and Easter first occupied their cabin on November 10th. Hutchins, who is now living in Mercur, Utah; and Easter, who is living in Goldfield, Colorado, agree in their statements to us that they had it finished and occupied on the first of November; and in this they are well sustained by their surviving pioneer associates.

With such evidence as this—and all of it is not presented here as being new—the case would seem to have been unequivocally settled in favor of the Hutchins-Easter house having next followed the Russell-Smith cabin. But, when the old record of the Auraria Town Company was deposited with our Historical Society a few years ago by Andrew Sagendorf, an entry was discovered in it that gave precedence and preference to John Rooker as a claimant for the honor, and incidental profit, that might accrue to the builder of Auraria City's "first" house, and started anew the controversy that had practically been settled in favor of Hutchins and Easter before it had almost worn itself out. The old record shows the following resolution to have been adopted at a meeting of the Directors of the Auraria Town Company on May 27, 1859:

> "Resolved, That in consideration of John Rooker having built the first house in the City of Auraria, there is hereby donated to said John Rooker three shares in addition to his former Share, making in all Sixteen lots."

We sent a copy of this resolution to Dr. Russell with a request for some information concerning its presence in the town company's record, if he could recall the circumstances to which it relates; he having been Secretary of the company at the time it was adopted and having made the entry. In reply he stated that he recalled the incident principally because of the worthless character of the man mentioned in the resolution, and said that Rooker was not much of a builder, nor anything else but a rascal; that he managed with the help of his father to get up a little shack of a cabin that was the first one to be occupied by its builder after the final organization meeting of the Auraria Town Company, and practically simultaneous with that event; although there were a dozen or so other cabins in various stages of progress when it was completed, and it was only in a technical sense that Rooker's was the "first" one. Dr. Russell adds that Rooker, on that ground, persuaded some of the Directors that he ought to be awarded in some way; and says further that a donation of three shares on such a provocation would have been a most extravagant one and that there may have been some misunderstanding or deception in making the reward of that magnitude.

The Sagendorf and Lebow Cabin.
(From an old sketch.)

An "original share" in the Auraria Town Company covered sixteen lots; an ordinary "share," four lots. The old records of deeds at the Court House contain no entry that appears to directly apply to the John Rooker donation; but on page 323, Book E, Arapahoe County Records of Deeds, is an entry recording the transfer of lot number five in block seventy-seven, from the Auraria Town Company by J. H. Dudley, Vice President, and L. J. Russell, Secretary, to Rebecca Rooker, (John's mother) on July 8, 1859, for the nominal consideration of one dollar. It would seem probable that this entry indicates, as suggested by Dr. Russell, the extent of John Rooker's reward. Another entry records the sale of several lots by John, the "Indenture" for which bore "his mark;" but record of his title to them was not found. These may have been those he acquired as an original shareholder. Each of the two town companies had a "lot-book" in which ownership of lots was entered, but Auraria's long since disappeared. When R. E. Whitsitt took general charge of the "Denver City" company's affairs in the spring of 1859, he instituted systematic records of real estate for all the towns, but in the meantime there had been many transfers by mere indorsement of "lot certificates." Book E, above mentioned is one of Whitsitt's records of which some further particulars appear in our historical account of Arapahoe county.

John Rooker was the son in the Mormon family of that name which, as we have stated, came to the South Platte on August 30th, and had remained in this vicinity in the meantime. It was the first immigrant family that located on the site of Denver. The Rooker house was built near and in line with the Russell-Smith double log-cabin, and upon its occupancy Mrs. Rooker, John's mother, became the first white woman housekeeper in the settlement. From the circumstance of other cabins soon being built there in line with these, and from others associated with some of the dwellers in them, the chain of improvements which became a continuous array was known as "Indian Row." The "Row" was along the northward side of Wewatta street eastward from Eleventh. The ground is now occupied by railroad tracks and the line of that part of Wewatta street is obscured. Just back of the site of "Indian Row," and also to the west of it, may still be seen traces of the river's old channel. The accompanying map indicates the location of the more noteworthy improvements in "Auraria City," in 1858, and of one in 1859.

A. H. Barker (Deceased).
(Photographed 1894.)

The late A. H. Barker was one of those who built early in these pioneer proceedings. In a manuscript account which he prepared before his death he stated that having arrived on October 24th, he decided to build a cabin without delay, and on November 1st began cutting and hauling logs for it; that W. S. Foster had then begun the Auraria survey, and that immediately upon completion of the first plat of a block, having his logs on the ground, he hastened the work and was the first to complete a cabin on a platted part of the town-site. He confirms the priority of the Hutchins and Easter cabin, and of Rooker's, which he says were built before the Auraria Town Company was fully organized. "I moved into my cabin," he goes on to say, "November 4, 1858."

A. H. Barker's Cabin.
(From his familiar picture.)

The accuracy of his memory as to this last-named date is open to doubt, as it allows but four days for cutting, hauling and preparing the logs, and erecting them into a cabin, in which work he does not mention having had any assistance. Furthermore, it does not agree with the date assigned by all other pioneers to the occupancy of the Rooker cabin which, as it was occupied on November 6th or 7th, must have been finished after Surveyor Foster began his work.

Our engraving of the Barker cabin is from a photograph of a drawing he had made from memory several years ago. The house stood on the northeast corner of Twelfth and Wynkoop streets, but the picture does not exactly conform to the survey, nor to the locality's topography at that time.

In that first week of November, 1858, preparations for building many other cabins in Auraria were under way. William A. McFadding, President of the Town Company; Judson H. Dudley, and several others beside those already mentioned, had begun within a day or two after the first meeting held to organize the company. Henry Allen, a leader among the "Auraria City" pioneers, built on the southwest corner of Eleventh and Wynkoop streets. E. A. Willoughby and M. A. Avery built theirs on the northwest corner of Wynkoop and Thirteenth streets, on the same block with Barker's. A. C. Wright was assigned a lot by the Town Company, on the northeast corner of Larimer and Tenth streets. He cut and hauled logs for a cabin, and then traded the lot and logs to Joseph Brown for an old mare, and Brown later put up a house on that lot. The order of erection and occupation of the improvements was no longer noted as of special interest to any except their owners, and the dates of their completion did not possess particular significance or importance as historical events. About the close of the year, however, Jack O'Neill, a noted and somewhat notorious citizen, came in and built a cabin on the northwest corner of Eleventh and Wewatta streets; and afterward made himself very conspicuous.

On the "Denver City" side of Cherry creek the first structure, though it was left unfinished by its original owner and was later reduced to the useful rank of a blacksmith's shop, was the cabin which S. S. Curtis and his comrades built for Charles Nichols, the poverty-stricken custodian of "St. Charles," early in November, 1858. But, as "St. Charles" went no further than that, the history of its buildings may be regarded as ended.

The beginning of "Denver City" was made at the intersection of Larimer and Fifteenth streets, and the first four cabins of that town were built there—one on each corner. Before any settlement was thought of anywhere here, the old military trail from Santa Fe, Fort Union, and the trading posts on the Arkansas, north to the trading posts above the site of Denver and on to Fort Laramie, passed through the site of "Denver City" along the general line of Fifteenth street; crossing Cherry creek at the intersection of Blake street, and the Platte river at the foot of Eleventh (old Ferry) street.

The four cabins were, respectively, General Larimer's on the southwest corner of Fifteenth and Larimer streets, Moyne and Rice's on the southeast corner, Hickory Rogers' on the northwest corner, and Lawrence and Dorsett's on the northeast corner. In appearance they were much alike, excepting that Moyne and Rice's and Lawrence and Dorsett's were double ones.

With respect to "first" buildings in "Denver City"—that is, aside from the Nichols cabin—there is a little tangle; but it does not in any way disturb the priority title of that historic structure. Previously published accounts have generally stated that the first cabin was built by General William Larimer, but they have located it at various places along the right bank of Cherry creek; a confusion arising, no doubt, from General Larimer's temporary occupation of the Nichols cabin while his own was building. His son, William H. H. Larimer, in letters to us, most positively asserts that his father's cabin was the first one built under the "Denver City" jurisdiction. But E. A. Willoughby, Secretary of the Pioneer Society, declares that the first structure completed and occupied by "Denver City" men was the cabin-shop of Moyne and Rice, carpenters and wagon-makers; that he as a carpenter worked on the building; and that General Larimer did not finish his cabin until a day or two afterward. The fact that William H. H. Larimer recalls that Moyne and Rice whip-sawed some planks for the door of the Larimer cabin might indicate that they were then located across Fifteenth street as aserted by Mr. Willoughby.

The building of Moyne and Rice was erected on the southeast corner of Larimer and Fifteenth streets. They had two lots there and built a double cabin on the line between them, back toward the rear of the lots, which fronted on Larimer street. One part of the cabin was used as a dwelling and the other for shop purposes. William Graham, the pioneer druggist of Denver, shared the cabin of Moyne and Rice during part of that winter.

General Larimer's cabin stood well back on the lot on the southwest corner of Fifteenth and Larimer streets, and its site is now covered by the Granite Building. The house was sixteen by twenty feet in ground dimensions, one story high, had a "dirt-roof," the soil for its floor, and fronted on Fifteenth street. It had a glazed window, the first one in "Denver City." It was of four panes of glass, eight by ten inches, which General Larimer had brought along from Leavenworth. The first glazed window in any building at the mouth of Cherry creek was in the cabin of Sagendorf and Lehow. They brought with them a small, glazed sash, which they used in their double cabin completed in Auraria City before the middle of November. The window does not show in the engraving, as it was in the other end. General Larimer's cabin was begun immediately upon the organization of the "Denver City" company by the election of its officers (which occurred November 22nd,) and was finished early in December; but the exact date of its completion and occupation is not certainly known. It had a door, says Mr. W. H. H. Larimer, made of boards sawed out with a whipsaw by Moyne and Rice, and they were the first boards cut in this part of the country. Our engraving of the cabin was made from a drawing sent us by W. H. H. Larimer, who says: "The original picture of the cabin was made by Surveyor-General Case, in 1861, just before it was torn down, and is almost perfect."

Lawrence and Dorsett built on the site of the present Pioneer Building on the northeast corner of Fifteenth and Larimer streets, their cabin fronting on Larimer. Hickory Rogers built his on the northwest corner—the "Riethmann" corner—and it also fronted on Larimer street. Both of these were built at so nearly the same time that it would have been difficult to decide at the time which was third and which fourth, in the order of pioneer improvements at the intersection of those two streets. It is not known where Whitsitt first built.

General Larimer's Cabin.

E. P. Stout, President of the Denver Town Company, built a cabin at the northwest corner of Fourteenth and Larimer streets, the site of the present City Hall, which he finished about the first of December. Of it he has given us the following account:

"It was 16x20 feet in size, of hewed pine logs, one and one-half stories high. It was first roofed with two large tents that I took with me across the plains; afterward, late in the spring of 1859, I had shingles rived out in the pineries and some lumber whip-sawed, with which I roofed it with shingles and put in a rough board floor overhead. The shingle nails I had the stage-driver buy for me of a trader at O'Fallon's Bluffs, and they cost delivered in Denver 50 cents a pound. That was the first shingle-roofed house on the "Denver City" side.

The "dirt roofs" with which nearly all of the pioneer cabins were provided did not always do satisfactory duty. The earth was sometimes put on to a depth of a foot or more, but after a heavy rain the water would soak through and keep dripping down inside for a day or two.

E. P. Stout's Cabin.
(From a drawing by Mr. Stout.)

The right of General Larimer's cabin to the distinction so long accorded to it has been still further disputed. It has been claimed that David C. Collier built a house in Denver City before him, but we have not been able to ascertain its alleged location, or that there is any foundation in fact for the statement. Collier, as W. H. H. Larimer states, helped to make the window sash for General Larimer's cabin, and therefore did help to build that structure; and from that incident it is probable that the story had its origin. He and William Clancey built a frame house in 1859 on the north side of Larimer street between Stout's cabin and Cherry creek, and his claim may have originally been that he and Clancey built the "first frame house" on the east side. Collier was one of a party of thirty which left Leavenworth in September. He drove an ox-team across the plains at a most leisurely pace, for he did not arrive at Denver City until December 1st. It would not seem probable that he could have put himself as a house-builder in advance of Larimer and the other men directly interested in "Denver City," who, as original shareholders, had pledged themselves to build immediately. "First" things, as we have already seen, often have more than one claimant, but in this instance there is no support. Collier was the first lawyer who offered his professional services in Colorado, and afterward became very prominent in affairs.

In some accounts John J. Riethmann has been represented as one of those who "built the first cabin in Denver." Mr. Riethmann makes no such claim. In a note to us he says:

> "Our first cabin was built on ground a little below the present Omaha & Grant Smelting Company's works about October 27th or 28th, 1858; our second cabin was located in April, 1859, on Larimer street, facing south, between Sixteenth and Seventeenth streets."

The distance of Riethmann's first cabin from the Cherry creek settlements was almost as great as that of the pioneer town of "Montana," and neither was directly a part of the beginning of Denver.

The Larimer, the Moyne and Rice, the Lawrence and Dorsett, the Rogers, and the Stout buildings were not alone in taking form and coming into being. Other shareholders in the Denver organization, and recruits who had cast their fortunes with the energetic men from Leavenworth, were at work upon their cabins, several of which were completed so near the same time that their finishing was practically simultaneous.

The most pretentious domicile built in "Denver City" during that winter of 1858-59 was the log dwelling of H. P. A. Smith, Governor Denver's "Probate Judge" of Arapahoe county. It was erected on the south side of Blake street, between Fourteenth and Fifteenth streets, and was burned in the fire of 1863.

The original shareholders in the Denver Town Company were under agreed-upon obligations to build cabins on their several allotments within ninety days after the company's organization, and a majority succeeded in doing so in less than a month. As in the case of Auraria, in preparations for the winter the rude structures suited to the necessities of the situation were hurried forward by all who had decided to stay, and made ready for use with great diligence; and priority of completion and occupation were no longer incidents of the special interest which attached to the initial achievements.

The mercantile pioneers were not far behind the pioneer gold-seekers and the pioneer town-builders in establishing themselves at Cherry creek. Some men who did not intend to become miners left the Missouri river with merchandise, bound for the Pike's Peak country, but a few months after the departure of the advance guard of prospectors who were destined for the same region.

In considering the early business undertakings here, our old friend John Simpson Smith must again receive a little left-handed attention. He has been set forth as "Denver's pioneer business man," and has been made to figure as "the first trader at Denver." Such statements are wholly misleading, and give him a place in the annals of this city to which he was not entitled. It is true that as an Indian trader he was a "business" man, but he did not establish himself here as a merchant, nor did he transact any mercantile business here of any consequence. His merely incidental coming here and the general character of the business in which he was engaged must preclude him from any serious consideration as a pioneer merchant of Denver.

At the close of October, 1858, the first intentional business men, the first who came bringing a stock of goods, and with the purpose of establishing themselves here, arrived at Cherry creek. This was before the Auraria Town Company had been organized, and before Denver City had blasted the hopes of "St. Charles." They were Charles H. Blake and Andrew J. Williams—the firm of Blake & Williams, from Crescent City, Iowa. They had a train of four wagons each drawn by four yoke of oxen, and it was an imposing caravan as it drew into the Auraria camp. Each wagon was loaded with merchandise, and the cargoes made a fair stock of general goods adapted to the wants of miners and other frontier customers. There was then no building in the camp the use of which they could get for a storeroom, so they put up a large tent they had with them, and in the temporary quarters it afforded opened their goods and began business on November 1st. They lost no time in building a large double-cabin which stood on the north side of Wewatta street, near the foot of Twelfth street, and was a continuation and enlargement of "Indian Row," and in which they were living and transacting business before the first of December.

Charles H. Blake (Deceased).
(Photographed 1892.)

When the Leavenworth men arrived and prepared to organize the Denver Town Company, Blake and Williams joined them in the enterprise. Those promoters saw that the enterprising business firm was composed of men of consequence, and lost no time in winning them over to an alliance with their future metropolis. Blake and Williams actively identified themselves with the new "city," but did not transfer their business to the east side of the creek until the following spring.

A week after the arrival of Blake & Williams another business establishment reached Auraria from the Missouri river, ending the long journey on the 3d of November. It was that of Kinna & Nye, bringing a small stock of hardware, some sheet-iron, and tinner's goods. It was in charge of John Kinna, who was the practical man of the firm, his partner and financial backer, John Nye, not coming here until the following spring. The Auraria survey was far enough along for Kinna to take a lot on Eleventh street near the northwest corner of Market and that street, where he soon built a cabin and began business. This establishment also yielded to the blandishments of the energetic Denver City men, Kinna joining the company. In the following spring when Nye arrived they moved the business across the creek into Denver City. It was no more than natural that the Aurarians lost their tempers under the persistent encroachments of their rival neighbors.

A. J. Williams (Deceased).
(Photograph, 1878.)

Early in December, the exact date being unknown, J. D. Ramage, a jeweler, and repairer of watches, arrived in Auraria and established himself on the east side of the present Eleventh street near the southeast corner of that street and Larimer—the third business man, and the first to engage in his line of business anywhere in this part of the country. There is no account of the Denver men enticing him over to their side, though it would probably be quite safe to say they tried. Their policy was to let no new man escape if they could prevent it.

Christmas, of 1858, was a notable time in Auraria City, and famed in the annals of that metropolis for many a day. Though Auraria was the more direct beneficiary of the events that made it long remembered, Denver City shared in the joys of that holiday. Richens L. Wooton, with a couple of wagons, laden with frontier merchandise, a large portion of which was contained in barrels, arrived in Auraria early in the morning of that day. He had come hither from Fort Union, New Mexico, and brought his family with him—which was a welcome addition to the few domestic organizations then at Cherry Creek. The goods being placed on sale, the third mercantile establishment was in existence; that of watch-repairer Ramage not being classed as a merchandising one. Wooton's narrative of his life and adventures says he occupied a vacant cabin upon his arrival, but all the survivors of that period now living in Denver, say that he set up a large tent alongside his wagons, on Twelfth street near Wazee, in which he began business; and that after New Year's times he was given a full share in the town company, and in addition thereto the ground on which he soon began the erection of his famous hewed-log, "two-story business block," which he completed very early in the spring of 1859. In his story he was not very particular about the accuracy of details.

The arrival of this new business enterprise and with it the coming of another family to the little community, were not the only events growing out of Richens Wooton's advent in Auraria that were calculated to make that Christmas time memorable all around the mouth of Cherry creek. Among the stores with which the welcome train was laden were several barrels of whiskey. Wooton concluded that he would make a favorable impression and a speedy acquaintance among his new associates by one sweeping appeal; and no method could have been more popular and effective in attaining both ends, than the one he adopted. He got out one of his barrels, and opening it, invited his callers to help themselves in tin cups to all they wanted of its contents. Of course, all Auraria promptly called; and tidings of the extraordinary dispensation spreading with the speed of the wind through Denver City, the inhabitants of that energetic town were soon, to the last man, trooping across the creek. Before nightfall Richens Wooton was "Uncle Dick" to every man in both towns. The flowing contents of that barrel submerged for the day the last vestige of rivalry and animosity between the "cities" separated by Cherry creek; and also a number of worthy citizens.

As to the quality of that whiskey the opinions of two of Denver's pioneers do not agree. In an address delivered at the annual meeting of the Society of Colorado Pioneers held in Denver, December 13, 1898, Mr. A. E. Pearce said:

> "On Christmas 'Uncle Dick' gave the whole town a free blow-out. The principal refreshments consisted of one or more barrels of whiskey; the heads being knocked in, every one helped himself freely, using tin cups. The liquid was what was in those days termed 'Taos lightning.' It came from Taos, New Mexico, and was warranted to kill at forty yards. It is needless to say that the whole camp got hilarious."

In those times "Wallipete" was another common name for a New Mexico whiskey. The noted frontier trader, Colonel Ceran St. Vrain, had located at Mora, New Mexico, and engaged in merchandising and milling. To his enterprises he added distilling, building a small distillery at the little Wallipete pueblo near Mora, and from that circumstance the liquor derived its name. It was distilled from wheat, there being no sufficient quantity of corn, and was as clear as spring water and very fierce. More than one Denver pioneer lost his balance and bearings under the impetuous influence of "Wallipete."

In his entertaining but somewhat apocryphal book, "Uncle Dick" records his opinion of the contents of his barrels:

> "I moved into a log cabin, and without waiting for any such thing as shelving or counters to be put in, I commenced business. I had several barrels with me which I rolled along-side of each other and used as a counter. What was in the barrels doesn't matter, but it was something every well-regulated store kept on hand in those days. I think there are a few highly respected old gentlemen still living in Denver, who will remember what it was, and would be willing to testify that it was a good article, if it did 'come high.'"

Wooton relates that he was induced to locate in Auraria more by the circumstances of a day than by any meditated intention; that when he left Fort Union with his train-load of goods his purpose was to make one more trading trip among the Indians, with the expectation of afterward going back to his old home in Kentucky and staying there the rest of his days; and that he came in the direction of the mouth of Cherry creek because he expected to trade with the Arapahoes and Cheyennes.

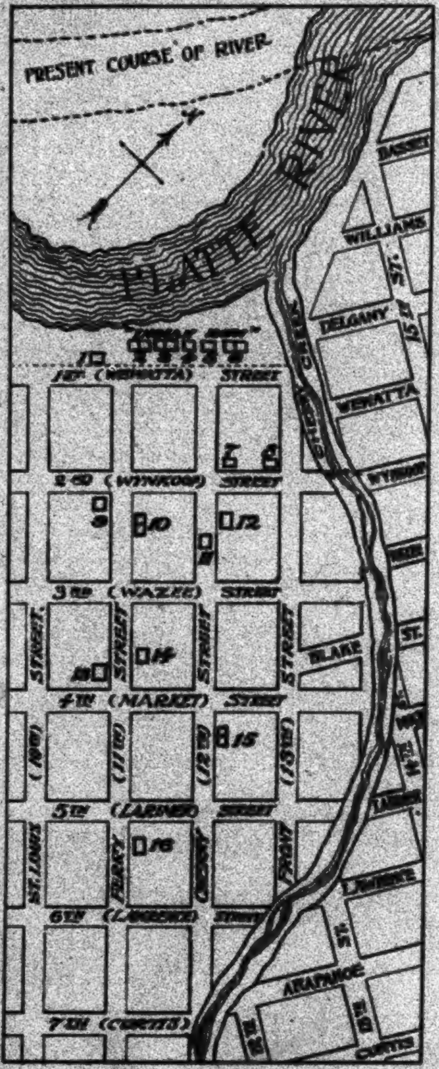
When he arrived he saw his opportunity, and was readily persuaded to go no farther, but to unload and begin business. In his book he claims that the Auraria Town Company, as an inducement for him to become a permanent citizen gave him one hundred and sixty acres of land, on their side of Cherry creek, "most of which is now solidly built over." The recipient narrates "they were short of money, but had plenty of land," which had little or no value at that time, and which he furthermore states, "did not bring a very large amount of money, when I sold it four years later."

Wooton romanced extravagantly in his narrative, and this was one of the flagrant instances. All the land claimed by the Auraria Town Company was, or was to be, staked off into lots; and while the company was donating a few of them to some people, it was not giving away quarter-section tracts, because it did not have them to give. The amount of land mentioned by Wooton was equal to one-eighth of the whole projected townsite.

In the address referred to above, Mr. Pearce also included the following interesting bit of detail of the local history of that first year in the Cherry creek settlements:

> "It may be of interest to some to note that the first Masonic meeting was held in a log cabin owned by Sagendorf & Lehow, December 10, 1858. In the same place a banquet was served to commemorate St. John's day. There were present at this meeting Andrew Sagendorf, O. E. Lehow, 'Jim' Winchester, 'Bob' Willis, James Ramage, Dr. L. J. Russell and 'Jim' Pierce. Possibly one or two others whose names I have not obtained."

This meeting was an informal gathering of Masons, as were the others held in the same cabin, and in that of Dr. L. J. Russell, in the closing weeks of 1858. Russell's cabin stood on the east side of Eleventh street between Wazee and Wynkoop streets; and that of Sagendorf and Lehow on the east side of Twelfth street between Larimer and Market, where these two pioneers owned lots which joined, and had built a double cabin with its middle on the dividing line. In January, 1859, a lodge was regularly instituted under the authority of the Grand Lodge of Kansas, and its meetings were held in the cabin of Sagendorf and Lehow.



Map showing locations of Auraria City's Pioneer Cabins.

(1. Jack O'Neill's; 2. Russells' and Trader Smith's; 3. McGaa's; 4. John Rooker's; 5. Judson H. Dudley's; 6. Blake and Williams'; 7. A. H. Barker's; 8. Willoughby and Avery's; 9. Henry Allen's; 10. Dr. L. J. Russell's; 11. Blood, Brown, et al.; 12. Hutchins' and Easter's; 13. Kinna and Nye; 14. Wooton's Building; 15. Sagendorf and Lehow's; 16. J. D. Ramage's. Numbers do not indicate order of erection.)

Among those who crossed the plains late in that autumn was Rev. G. W. Fisher, a minister of the Methodist church. He reached here early in December, and during that month held a series of meetings in the little hamlets, the first public religious services here on the South Platte river. There was, of course, no church building in either of the towns at that time, these meetings usually having been held in the cabin homes that were opened to them. At this time there were but five women, Mrs. D. M. Rooker, and her daughter; Mrs. H. Murat, wife of the "Count;" Mrs. Smoke, and Mrs. Wooton, in the two towns, which were not especially cheerful places that winter, though the weather at times was exceptionally mild and pleasant. Christmas, of 1858, was like a day in June.

The reader will have seen that, notwithstanding the industry and perseverance of the Denver City people, the close of the year 1858 left the other "city" distinctively ahead in material progress. Auraria had twice as many cabins as Denver, twice as many people, and all of the commercial establishments that had ventured to Cherry creek. Still, Auraria was uneasy and feared the men who had charge of her rival's destinies, and anxiously awaited events.

With characteristic energy the Denver City men persisted in their endeavors to persuade Aurarians to move over to the east side of the creek, and succeeded in getting a number of them to do so. That autumn was a fine one, and small parties belated in their expected progress kept coming in through December. These divided their numbers unequally between the two towns, Auraria getting the larger share.

The proselyting of Aurarians was a sore grievance to the founders of that town, and other aggressive manners of the Denverians added to it, brought on a feeling of rivalry that soon developed into one of great animosity, which encroached upon social, business and political relations. Men who were not disposed to participate in the verbal hostilities were called upon to take sides and declare themselves Aurarians or Denver men. For several months this rivalry was intense, and did not subside until toward the close of the next year, when the more conservative citizens first saw their way to a consolidation of the towns.

But few of the Aurarians knew anything about the "St. Charles" enterprise, and cared less. Smith, and McGaa, said little about it, and if they ever regarded it as of any importance, their interest in it had disappeared upon the organization of Auraria. Those who had some knowledge of the undertaking of French, Cobb, Dickson, and their associates, from Nichols, had ridiculed the idea of locating a town on the eastward side of the creek. When the Leavenworth men came in and occupied the "St. Charles" land the Aurarians had affected great indifference toward their active rivals. They smiled at the Leavenworth proceedings and declared that nobody would take as a gift a lot in a town on that side of the creek; that it stood to reason that Auraria was and would continue to be the only "city" here; and this unnecessary "Denver City" never could and never would be a competitor of Auraria, no matter what its projectors tried to make of it. These views seemed to be sustained by current circumstances, for a large majority of the incoming people had located on the west side. This had placed the Auraria settlement far in advance of any other in the Pike's Peak region.

After Denver's usurpation of the site of ill-fated "St. Charles," Auraria was also disposed to take on airs because of her great antiquity as compared with the youthfulness of her energetic neighbor on the east side of the creek. As a known place with a definite name she was held by her partisans to be venerable; for, when Denver was first laid down on paper was not the founding of Auraria an event dating all of two or three weeks back in the misty past?

As we have, in a preceding chapter, specifically accounted for the name "Auraria" having been bestowed upon the west-side settlement, it may be well at this juncture to be more specific than we heretofore have been with regard to the naming of Denver City. In many published reminiscences the honor of having chosen our city's name has been claimed by perhaps a dozen different pioneers, and the narratives have been accompanied by much and apparently trustworthy circumstantial detail, especially as to controversies at various times over a choice from numerous proposed names. These tales are wholly fictitious. No other name was ever suggested, and there was no controversy in deciding upon the one given. The name "Denver City" was immediately formally approved at the first meeting—November 17th—by all the leaders in the enterprise. It was the choice of all the members of the Leavenworth party, and no one more than another was entitled to credit for having selected it. That it was adopted on November 17th is told by E. P. Stout, the company's first President; confirmed by S. S. Curtis; and the fact is of record in the minute book of the company under date November 22, 1858, wherein it is stated that the "Denver City Company [previously formed] adopted the Constitution," and elected officers on that day. In that entry the further statement is made that a committee, "previously appointed," had already staked out land for a town-site "called Denver City."

At the close of 1858 Auraria contained about fifty cabins and Denver about twenty-five; and all hands believed that the Cherry creek settlements had made fair beginnings, though as to which were the better place depended entirely upon the location, with respect to the creek, of the man who formulated the opinion. Everything considered, a great deal had been done in eight or ten weeks, and much more was already planned for the immediate future.

The rivalry between these sorry little metropoles standing here in the winter loneliness of the great plains, was genuine and deep-seated, though it may appear comical and absurd to the reader who is of this day and generation. The two forlorn groups of squatty cabins built of cottonwood logs, roofed with grass or earth, and chinked with billets of wood reinforced outside with plastered clay against the winds that were expected to blow and blow, put in much of their spare time that winter making faces at each other across Cherry creek.

Turning from this rude and wrangling pair of ambitious frontier hamlets, the spectator's thoughts were lifted away from the petty contentions of human existence. The one thing that Auraria and Denver had in common was the magnificent setting Nature had given them. Over the grandeur and beauty of all that lay around them, the heritage of each and the glory of both, there could be no differences, no dissensions, no strife. A writer of that period thus described the view from the front range, back of Golden, and the impressions it made upon him in one of those autumn days in the beginning:

"All the region from Long's Peak around by the Cache-a-la-Poudre, Beaver, and Bijou creeks to the summit of the divide between the Platte and the Arkansas, and back past where I stand 'to the place of beginning,' lies spread out at my feet like an unrolled map. West is a vast sea of dark green mountains, sweeping away and upward into the clouds, tipped in the distance with the whitest of snow, now more or less agitated by the storm spirit. These be the everlasting watchtowers of the continent. But the first is the lovely part of the picture. There, spread out like a carpet, glowing in the rich splendor of the autumn sunlight, lies the brown, swelling plain, cut in various directions by wood-fringed streams—a magnificent sight. Columns of blue smoke rise calmly and float leisurely away from Auraria City, from Placer Camp, and intermediate camps, along the river. The American has come to this hitherto unknown region, and the sound of the rifle and the axe, the lowing of stock and the falling of timber around the smoke columns, are sounding the death-knell of the wild beast and the wilder man of the soil—are proclaiming the fact that their restless and encroaching enemy has set himself boldly down in their midst, to scatter them like chaff, and to possess and improve the Talent they have so long had buried in the ground."

CHAPTER XXIV.

EFFECT IN THE EAST OF "PIKE'S PEAK STORIES" IN WINTER OF 1858-59—GREAT INVASION IN THE SPRING OF 1859—REFLEX OF PANIC OF 1857—CHARACTER OF IMMIGRANTS—HARDSHIPS OF THE JOURNEY—RECKLESS ENTHUSIASM OF THE HOST—LEGENDS ADORNING WAGONS—DAILY ROUTINE AND INCIDENTS—DELUSIONS OF EMBRYO MINERS—MASS OF IMMIGRANTS NOT OF UNWORTHY MEN—PECULIAR CIRCUMSTANCES ATTENDING COLORADO'S SETTLEMENT.

Through the winter of 1858-59 the "Pike's Peak fever" spread over the Mississippi valley and even down the Atlantic slope. The reports from the west, ranging all the way from the most grotesque fabrications, down to occasional but almost downright contradictions, with each kind apparently having some sort of foundation, put the Missouri river towns into a babel of excitement, and then proceeded farther east expanding as they went along. To the restless, mercurial portion of the inhabitants of what was then the frontier, the optimistic accounts were by far the more acceptable, and nearer like what they thought they ought to be, and what they wanted. To the stranded, impecunious, idle boomers of the Kansas and Nebraska paper-balloon "cities" submerged by hard times and rank growths of prairie grass, these golden stories came as special messages from a pitying Providence; to the gamblers and adventurers of the Missouri river region, joint sufferers with the forlorn town-boomers and from the same causes, these rumors were comforting invitations to new fields of usefulness; to the bankrupt, the weary, and the disgusted, they held out a promise of better things, and stirred their hearts with new hope; to the sturdy, honest, ambitious, adventurous element, which was by far the larger portion of the eager multitude, Pike's Peak became the landmark around which they would find fortunes large enough to last them all their days; and so they started in a heedless, headlong rush across the plains toward the new land of gold.

The following incident of the popular excitement along the Missouri river in these times, is recorded by Hollister:

> "A German in Council Bluffs was observed gathering up a large lot of meal-bags. He was asked what he was going to do with them. 'Fill them with gold at Pike's Peak,' he replied. O! he could never do that, they said. 'Yes, I will,' returned he, 'if I have to stay there till fall.' It is a matter for congratulation that people have become well cured of such charming infatuation."

Thousands in other parts of the country had made preparations to move forward to this land of promise, and in the spring of 1859 there was a great multitude of hardy, hopeful people stringing across the plains with vehicles of all sorts, from the huge prairie schooner drawn by a half-dozen yoke of oxen, down to push-carts to which sanguine souls hitched themselves and trudged along for weeks before the whitened summit of Pike's Peak in the hazy distance, gladdened their eyes. On the southern route, a young man, who certainly deserved well of fortune, trundled his belongings—provisions, clothing and tools—all the way from the Missouri river in a wheel-barrow, arriving at Denver in good condition, and with a cash capital of ten cents in his pocket. He was a printer by trade, and afterward won greater prominence in the affairs of the community. Some carried all their possessions on their backs and cheerily made their way through the long journey, in company with some better equipped friend, or a newly-made acquaintance. There was an almost endless procession of white-covered wagons, from the modest outfit drawn by two mules or oxen, to the huge freighter moved by a dozen or so of animals. In the heydays of the rush they were nearly always in sight of each other, and usually they went in groups and caravans.

Early in the spring some disquieting rumors had been put in circulation to the effect that the small amounts of gold sent east the previous year had not been found in the vicinity of Pike's Peak, but had been brought from California. This caused some, already a few miles on their overland journey, to turn back; and kept others who had not yet left the Missouri river, from attempting the trip. Many of these dismayed embryo pioneers returned to their former homes and stayed there the rest of their days. In that excitable frontier assemblage hope and enthusiasm would hold full sway for a brief season, and then give way to some doubt, and uncertainty of purpose.

Nevertheless, after all the wavering had been left behind, the hitherto unfrequented trails, known best by the buffalo and the Indians, were soon lined with sanguine emigrants and their outfits. At night their camp-fires made strands of beacon lights that stretched along the new thoroughfares, from the Missouri river to the Rockies. The stampede to California ten years previous was repeated on a larger scale, by this host of hopeful, eager, would-be hunters of gold. The dark side of the California story, its privations, sufferings, and bitter disappointments, were all forgotten in the excitement and hopeful enthusiasm of these times.

When it is properly considered that all these people—every mother's son of them—were coming to this little-known country that was still in full possession of the Indians, hundreds of miles from the advance line of civilization, upon the mere unconfirmed but glowing class of rumors that had reached them in their distant homes, the extraordinary character of the movement may be more intelligently understood. There is no parallel to it in the history of this or any other country, for the occasional unfavorable reports appeared to have had but limited effect. The break for California ten years previous was in some important features not comparable to it; not in numbers of those who participated, nor in conditions, nor in circumstances. Up to the first week of May, 1859, when Gregory found his lode, and Jackson's work had been done, no gold had been discovered here in amounts worth considering; yet, before the date mentioned, all of these people had made preparations for their long flight, and probably two-thirds of them were actually on their way hither; and all induced to the great undertaking by the flimsiest stories from unknown sources, spread broad-cast by reckless and irresponsible agencies.

It is probable that had conditions in the States been different at that time, there would have been no such streams of eager, visionary humanity flowing across the plains to a region in which fancies, growing out of these fabulous stories, had pictured golden fortunes lying await for everybody who would or could come here and take possession of them. The year 1857 had brought financial disaster on individuals, corporations, municipalities, counties, States, and even the Nation. The panic of that year had torn over the country, from the Missouri river to the Atlantic sea-board like a tornado, spreading wreck and ruin everywhere. The flimsy, stupid, trouble-breeding financial and banking system of the country—if such a weak and makeshift fabric might properly have been called a system—was chiefly responsible for the memorable financial revulsion of that year. Back of it and depending upon it were inflated credits, wild speculations, the "booming" of unnecessary "cities" in impossible places, and all the other castles in the air that usually precede, and also usually precipitate, a financial collapse of far-reaching evil consequences.

State banks with their offspring branches, corporate banks trying to stand alone, and private banks galore, had flooded the country with their trashy "currency," and when the strains passed the breaking point, these concerns tumbled down aheap, and most of their promises to pay could have been used for cigar-lighters without loss to those who held them. Public credit and resources suffered with those of individuals. Treasuries were empty, and nothing in sight, worth having, to replenish them. The weak government of the Nation was about as badly off as the rest, and in its impotency was unable to either help itself or anything else.

The hurricane strewed the country with wrecks of personal fortunes, and so littered the paths of all enterprises with broken rubbish that they came to a standstill. Through all the avenues of business and occupation the paralysis made its way, until almost every man felt its grisly effects. Thousands were out of employment; thousands were out of homes; thousands out of business, and bankrupt beyond hope. There was neither money, credit, nor opportunity after the storm of that year had swept over the country.

The wide-spread consequences of the blast were sorely felt in 1858. Indeed, it may be said that the full effects of the disaster were not comprehended until that year by the masses of the people. Signs of even partial recovery were few, and slow in making their appearance. While this depression ruled the land, came the false accounts of marvellously rich discoveries of gold at Pike's Peak—tales magnified a hundred fold in their telling and retelling. Thousands who could rake and scrape means enough together to provide what was necessary for a journey to the distant region, made preparations to set out for the new country where they hoped to retrieve their broken fortunes.

To these unhappy circumstances of 1857-58 the presence of many hundreds who helped to swell the host of men who went trudging across the plains in the spring of 1859, was due. Scores of them were bankrupt men, hopelessly unable to pay their debts, but that did not imply that they were not honest men; the fact that they were on their way here proved that they were courageous, hopeful, willing men. In innumerable instances all the worldly possessions of individuals, who but late had had much more, were represented by the outfit they were taking across the plains to the hoped-for land of gold.

In 1858, the central plains were comparatively lonely places for white men. The Indians and the buffalo were the most conspicuous of the moving objects seen by those who came to the mountains that year. There were occasional straggling parties of people still connected with the disappearing fur business, and some caravans of freight wagons bound for Fort Laramie or some other remote military post, or to Salt Lake, with a sprinkling of emigrants headed for California or Oregon. The

Salt Lake stages made their semi-occasional trips along the Platte valley, rounding up the list of movements over the plains in this direction at that time. Fort Riley, in Kansas, and Fort Kearney, in Nebraska, marked the western frontier, with little between them and the other side of the mountains except Fort Laramie, and a few scattered outfits of traders gathering up the odds and ends of what had once been a great business.

The following year saw all this vastly changed. Before midsummer of 1859 there was, not a mere succession of emigrant trains, but practically a continuous train from the Missouri river up the Platte valley to Denver, that being the route followed by most of the people. But the Smoky Hill route, and that along the upper Arkansas river, were thronged, though by lesser numbers. No emigrant had reason to complain of lack of company on the plains that year or in the next one. He could hardly get out of sight of others bound on errands similar to his own.

Over the Plains in 1859.
(From an old engraving.)

With the exception, to repeat a statement already made, of the movement to California in 1849-50, nothing approaching the like of this hegira was ever seen before, nor will it be seen again, in this world. The California tide at its highest in its progress across the plains, never assumed the remarkable proportions of the great stream that made 1859 so memorable a year in the history of the west. All sorts and conditions of men were represented in the hurrying multitude. This driver of an ox-team was a former banker from the land of sunrise; that one a doctor without a practice in the place he had left; the other a lawyer whom clients had deserted. Bankrupt merchants, decayed politicians, gamblers and adventurers—all plodding along in the almost endless throng, which included a goodly sprinkle of individuals who had left the States for urgent, if not pleasant, reasons.

But the general character of the mass was far from being an unworthy average. The majority of the men were there because they were cast in a different mold from those they left behind them. Thousands of them were the kind of men that have led the way in every pioneer movement in this country. Many of them were directed to the isolated and laborious life of a Rocky Mountain pioneer, by circumstances; but the fact that they had the energy and determination to do what they were doing, hastening to the hardships and privations of the plains and mountains, showed that they were made of pretty good material. Every New England State, New York, Pennsylvania, Ohio, Indiana, Illinois, Virginia, Georgia, Kentucky, Missouri and its borderland; France, Germany, England—all were contributors to that hopeful multitude. City men from Boston, New York, Philadelphia, Cincinnati, New Orleans, St. Louis were among the masters of ox-teams, the cooks at the camp-fires, and the scullions and helpers in the daily life of the long journey.

It was not a holiday outing. To nearly all it brought trials, privations and hardships; to some it meant all of these with sickness and death added. The Indians were not seriously troublesome at that time, yet some of them occasionally made attacks when good opportunity offered, and more than one isolated unfortunate had his dreams of fortune and his life ended together at their hands. Some of the impatient ones, eager to get through at a faster pace, turned off the beaten trail into new and untried routes, only to suffer untold misery. Their supplies gave out, the new ways led through dry, grassless stretches, their animals perished from exhaustion, and themselves not always escaped death from hunger and thirst.

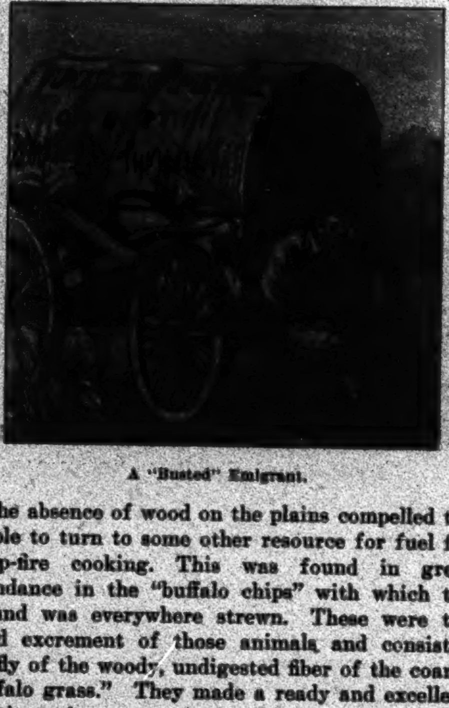
Three brothers from Missouri, named Blue, starting by the Leavenworth route, wandered into a dry and grassless region. Their cattle died and they subsisted for a few days on the carcasses. Later one of the men died of starvation and the other two ate of his flesh. Then another died and the third repeated the practice of last resort, but was a maniac when discovered by others who had also left the established route. Many of the thoughtless or ignorant people started with an inadequate supply of provisions and became dependent on the generosity of their more provident fellow-travelers, before the journey was half completed. Others set out early in the season, before winter had given way to spring, and frozen limbs made cripples of some of them for life.

The buffalo and antelope had by that time learned that the great, serpent-like train of wagons and people, winding its way through their domain, was a most dangerous thing to them, and were inclined to keep away from it. Therefore, to obtain additional food supplies from this source a halt would often have to be made and a hunt organized; and unnecessary stoppages were no part of the programme contemplated by that hurrying throng, the progress being slow enough at best. Upon occasion and in many places there was little trouble in shooting a buffalo or an antelope, while at other times the animals kept at long distances, and in some instances were entirely out of reach.

Some emigrants who came by way of the Smoky Hill trail in the dry season were obliged to drive their teams of patient oxen continuously for stretches sometimes reaching sixty miles between water points. Both men and animals suffered extremely, many of the animals perishing from thirst and exhaustion. These, however, were exceptional instances.

But through it all, and in the large majority of that patient, toiling host, there was the sanguine, buoyant, determined spirit characteristic of the American; often reckless and always hopeful. To most of them the experience was entirely a novelty, and the plains and mountains as new to them as the landscape of the moon would have been. More than half of them were from offices, shops, retail stores, and farms east of the Missouri river, and a large proportion from east of the Mississippi. They had never seen the plains, had never seen the mountains, nor wild Indian, nor buffalo, nor lode, nor placer, nor a grain of gold in its native situation, nor anything belonging to the new country of their destination, nor anything associated with the practical methods of accomplishing their one great purpose—digging gold at Pike's Peak. On they went, usually finding safety in numbers, and trusting to luck favoring them in regions which were the remote abodes of wild beasts and still wilder red men.

Many of the emigrants embellished the white covers of their wagons with mottoes and legends indicative of the purpose of the journey, or of the determination of the individual proprietor. An Ohio man on the Leavenworth route in the spring of 1859 had emblazoned on his wagon in large letters, "Root, Hog, or Die!" An Indianian had a picture of a sharp, needle-like peak which stuck through the clouds and far above, under which he had confidently paint-brushed, "I'll Get there." On another wagon, and probably the result of experience, appeared: "Jordan am a hard road to travel." The favorite inscription was the simple announcement "Pike's Peak;" that conspicuous outpost, in the absence of an official name for the gold region, standing for all the country from which it was visible. Some resolute souls added to this the words, "or Bust;" and one whose cattle had died, leaving him without motive power, amended his proclamation so that it read in full: "Pike's Peak, or Bust! Busted, by thunder!" This conception was imitated by others upon whom like misfortunes had fallen. When the eastward panicky stampede set in later in the spring of 1859, this legend in full on many wagon-covers, unreservedly proclaimed the experience and conclusions of their owners. One cheerful individual had sketched with charcoal as large a figure of an elephant as the canvas cover of his wagon would admit and beneath the rude drawing was written: "What we saw at Pike's Peak."



A "Busted" Emigrant.

The absence of wood on the plains compelled the people to turn to some other resource for fuel for camp-fire cooking. This was found in great abundance in the "buffalo chips" with which the ground was everywhere strewn. These were the dried excrement of those animals and consisted chiefly of the woody, undigested fiber of the coarse "buffalo grass." They made a ready and excellent substitute for more substantial fuel, but the great demand for them soon caused a scarcity along the main lines of travel.

The daily routine of the immigrants while on their way across the plains, is thus described by a writer who made the journey with a team of oxen drawing his loaded wagon:

"The majority of the travelers left camp about 7 o'clock in the morning and would travel until about noon unless the day was sultry, when they would turn in at 11 and rest until 2 o'clock. Then they would proceed until 6 o'clock, when they would encamp for the night, provided fuel and water were at hand. The first duty of the morning was to loose the cattle and turn them out to graze. The next was to provide breakfast. When this was dispatched the tent was struck, the bedding folded, the camp furniture gathered and all was packed away on the wagon. Then the cattle were driven into camp and yoked and the start was made. After traveling eight or ten miles the party stopped for lunch. After an hour or two the journey was resumed and we continued until 6 or 7 o'clock, having travelled a distance of eighteen or twenty miles. At times it was necessary to continue for twenty-five or thirty miles in order to reach water."

The emigrants were well supplied with arms, mostly rifles and revolvers. Many were killed or injured by carelessly handling their weapons while on the journey or after reaching the mining camps. A fruitful source of trouble was their habit of drawing their rifles out of the wagon by the muzzle end. Standing their guns against the wagons to have them knocked over by accident, or frequently scrutinizing their new revolvers, often brought fatal consequences to themselves or bystanders. It is probable that more lives were lost by these accidents than were saved by possession of the firearms. But every man regarded his weapons as essentials to his outfit, and quite as necessary as his pork and beans.

One of the more pretentious caravans of this period is thus described by a writer who saw it encamped for the night:

> "It comprised six or seven heavy wagons, mainly drawn by oxen, with a light traveling carriage and pair of horses conveying the patriarch's family; some two or three hundred head of cows, steers, and young cattle with three or four men on horseback driving and keeping the herd. Girls were milking; women cooking or washing, children playing—in short, here was the material for a very fair settlement, or quite an imposing Kansas 'city.'"

Such a scene would recall the life of Abraham, of old, with his kindred, his flocks and herds gathered around him, on the plains of western Asia.

The emigrants made it a rule to cross a stream immediately upon reaching it, if it were possible to do so and if their way was across it. They would not camp until they did so. The Platte and some of its tributaries had an eccentric and troublesome fashion of suddenly rising to flood tide and making fording a risky undertaking for several days; and occasionally delaying the weary, impatient travelers a week or more, when this rule had been disregarded. Reckless attempts to ford the swollen streams caused many a disaster to the driver's worldly possessions. But the streams out farther did not so often bother them in this way. In the summer months there was more frequently a famine of water than a feast of it in their beds.

In the advance guard women were scarce, but they soon appeared more promisingly among those who followed it, and with them came children of both sexes, all sizes and ages. Some of these, now in the afternoon of life, are living in Denver in enjoyment of the favors fortune has brought them. With the coming of women and children came, also, the graces of life, better social order and conditions, an increased regard for the amenities of existence, and consideration for the rights of neighbors.

As soon as the new-comers reached the streams which put out from the mountains, the eager ones would jump in and begin looking for gold, probably turning over dirt and sand that had been previously and fruitlessly searched by far more experienced men. Occasionally they were rewarded by a very little gold in a great deal of sand, but far more frequently they were not. Most of them acted as if the recovery of gold was one of the simplest undertakings, and that the metal was to be gathered up anywhere and everywhere in the creeks and rivulets; nor had many of them any knowledge of the great amount of the hardest kind of labor that placer mining demanded. They soon learned that they had to throw away the golden fancies that had cheered them while on their journey across the plains, and this new wisdom added to the bitterness of the disappointment that subsequently came to most of them.

Prairie Schooner at Anchor.

What we have said in the foregoing is more especially with relation to the movement of 1859; yet, it applies with almost equal force to that of 1860, when nearly as many people crossed the plains to the mountains here, re-enacting the same scenes, presenting the same individual characteristics, entertaining the same visionary expectations, and undergoing the same experiences and practicing the same follies after they got here—Fortune smiling on the few and frowning on the many. After the civil war broke out, the movement was checked, and for two or three years remained of comparatively slender proportions.

As a whole, the circumstances under which this region was peopled have no parallel in the history of this country. Some of those, as we have said, presented by the settlement of California ten years previous, were similar. But the example of that State did not equal, in many respects, the remarkable experience of Colorado. There was no such pouring in of people there as this flocking of thousands and tens of thousands here in 1859 and 1860—most of whom trooped away again—and all the conditions were radically different. The means of reaching California were better, and considering everything, were cheaper, to those who went there by water. While many made the journey overland, those who voyaged to the isthmus and thence by water again were in the great majority, and could make the trip with comparative comfort. Furthermore, they were not pressing into the midst of an wholly unsettled region, infested by warlike Indians, and remote from a ready highway of travel available for mechanical transportation.

Colorado had no gentle tide of immigration like that which slowly and steadily occupied the territory of the older States. When it set in it came as a tidal wave, carrying with it the good, the bad, and the indifferent. The pioneer, as Ohio, Missouri, or Kansas knew him, establishing himself on virgin soil from which he cultivated the means of his subsistence, and on which he built a cabin home for himself and his family, was unknown in the settlement of this country. Those who had been scattered through it before the summer of 1858, were mere roving adventurers, here for a transient purpose, neither thinking of nor caring for permanent, civilized, expanding occupation and development.

It cannot fairly be said that as a rule those brought in by the great tidal wave of 1859 were led on by motives much different or better than those of the trapping and trading adventurers. The common desire for gold was first and last in the thoughts of all, and the accepted beliefs that the new country was inhospitable and undesirable for any purpose save that of satisfying this craving, made almost every man, whether by calculation or chance, keep a feeling about himself and his enterprise, that he was only to be a sojourner here who would return to his old home as soon as he had basked a while in the smiles of fortune.

These winding trains, these trailing caravans, and these trooping foot-soldiers of fortune were not bound for a region in the west far beyond the distant horizon, where it was hoped to found a new empire, to subdue a wilderness, convert it into fruitful farms and blooming gardens, and to establish happy homes for declining years. These men had no such purposes in view as those which brought the Pilgrims to the rocky coast of Massachusetts; no such patriotic impulses as those which led to the French settlement of Canada and Louisiana—the honor of their King and the glory of France; no such motives as those which inspired the Jesuit fathers to carry the word of their Master to the savage people in the American wilderness.

They did not expect to stay a great while in the country to which they were bound; they were not particular about finding a place where they could worship God according to the dictates of their own consciences; they were quite willing that the administration at Washington should attend to the honor and glory of the Nation; and they had not the slightest interest in the spiritual welfare of the western red man.

There was little of that anticipated identity with the new country that usually comes into the thoughts of men going to new places and scenes to work out the purposes of their lives. It was a great army of fortune-seekers, pure and simple, to be turned this way or that by the capricious grimaces of the goddess of their cause, that came streaming across the plains in 1859 and 1860. The plans of nearly all were held subservient to the chances or changes of a day, and every one of their calculations centered around the single purpose to quickly acquire a fortune and speedily return to civilized parts. Nothing could have been further from their intentions than the founding of a beautiful city, the building of a great State, and their permanent detachment from their former homes.

Indians Attacking Emigrants.

A popular but altogether erroneous belief concerning the general character of these hosts of men, is that they were the refuse of the older communities whence they came. This statement has been made, and repeated so often in books and newspaper letters telling, or trying to tell, of these old times, that something like a conviction exists in the minds of many people, that the pioneers of 1859 and 1860, in the Pike's Peak region, were mostly scoundrels, of but varying depths of dye. As an example of this misrepresentation, an average statement, is that of McClure in his book "Three Thousand Miles in the Rocky Mountains." He said, referring to the great movement of 1859:

"Nine tenths of those who came at first were either fugitives or adventurers. In one mingled mass came the honest bankrupt, the fugitive from justice, the gambler and the loafer."

This was not so. In one sense they were all adventurers, but to assert or imply that as a whole the mass was composed of bankrupts, criminals, gamblers, and loafers, is stupid, ignorant nonsense, formulated from the stories it was once common to relate of many places in the west. There were gamblers and other criminals a-plenty; but as to the loafers, this country was probably the most uninviting region in the world for them. The truth is that while many had been bankrupted, and many others impoverished by the collapse in 1857, in the main the men who came here in the pioneer times were of average honesty, and of more than average enthusiasm and heedlessness. They were inspired by no worse motive than one to better their worldly condition, and to do it in one or two summer seasons.

In those days the appearance of the average person here was not what would fulfill our present conceptions of a presentable man. Those who had wives back in the east waiting for their lords to return treasure-laden, would not have been recognized by their distant spouses. The miners were bearded and begrimed, tanned the color of sole-leather by exposure to the sun and winds, and clad in a motley and often patched or tattered outfit of garments. The three imperative demands upon their time—working, eating and sleeping—left none for personal adornment, even if the inclination to it had not, practically, disappeared. The new arrivals daily trudging into Denver by hundreds, as heavy of movement as their weary slow-going teams of oxen, were no better. They were hideously hairy and unkempt, sun-browned, recklessly ragged, some of them bare-footed, and all dust-covered and begrimed. The addition of goggles, worn to protect their eyes from the glare of the prairie sun, gave to many a mild-mannered, peaceful man a dangerous and, to some individuals, a ferocious, aspect.

In what we have said here of the transitory character and purposes of these people, the application is intended for the great mass of the multitude. In a few instances new-comers partly realized the possibilities of the country, or thought they did, and acted upon the impulses thus aroused. It is exceedingly difficult to reconcile events with the theory that the men instrumental in bringing them about were endowed with unusual wisdom, and extraordinary ability to foresee things. It is not probable that those who platted and named the embryo towns at the mouth of Cherry creek in the autumn of 1858, ever dreamed at that time that either, or both combined, would become a great city, or even an important town. But the fact that they did propose a permanent settlement and occupation of the country, separated them in thought and purpose from nine out of every ten men around them.

In most instances the founding of American cities was the out-growth of pre-existing necessities; or of the presence of some commanding local natural advantages fully understood beforehand; or of some other motives in which calculation, preparation and intention were likewise involved. Sites were deliberately chosen with especial reference to the previously known natural advantages of locality and surroundings, immigrants came with the purpose and expectation of permanent personal identity with their chosen places, and the infant settlements were patiently nursed and coddled by their projectors and partisans.

It was not so with Denver. Her founding was an accident of circumstances at a time when even the circumstances bid fair to be transitory, and when advantages and resources may be said to have been unknown. In her infancy she was the temporary objective point for thousands who cared nothing for the country, nothing for the town; who had no intention of permanently identifying themselves with either, and with but the one thought of getting what they came for before somebody else got it, and then getting away again. It was not until the rare beauty of the accidental location, the grandeur of the region, the charms of the climate, and the enormous permanent resources of the country became fixed in the minds of the people, that these alien feelings and purposes disappeared.

CHAPTER XXV.

Progress of Cherry Creek Towns—New Business Enterprises—First Hotel—"Count" Murat—First Ferry—First Birth in the Settlements—Career of the First-Born —Isolation in that First Winter—Further Improvements and Business Enterprises—Arrival of Saw Mills—Political Movement—Pioneer Newspapers—Transactions of the Town Companies—Homicide—First Stages to Denver—Progress Made by Midsummer of 1859.

That winter of 1858-59 had been neither an idle nor a resultless one in Auraria and Denver "cities."

Thomas Pollock who had arrived from New Mexico on December 29th, opened the first smithery here on January 10th. It was an Auraria enterprise, located at the southwest corner of Market and Eleventh streets. Pollock was handy and effective with a gun or a revolver and became a most worthy and useful citizen. At the same time Kasserman, Luttrell and Hemphill set up a log carpenter's-shop in Auraria—the first of its kind in that settlement—at the southwest corner of Lawrence and Tenth streets, where they later built a two-story dwelling. Simultaneous with these events Henry Reitze, from Omaha, and E. Karcsewsky, from Chariton, Iowa, began the first bakery business, which was hailed with the utmost satisfaction by the population which was, with a few exceptions, wholly masculine, and had long been enduring the makeshift results and unhappy consequences of their own bread-making. This pioneer bakery was located on the east side of Eleventh street, between Market and Wazee streets—at present number 1427 Eleventh. In this same month of January, John Ming brought out a stock of groceries which he installed in a cabin he built as an addition to "Indian Row," which was now becoming quite an array of business establishments.

The first saloon at the mouth of Cherry creek was opened by Rice & Heffner in January, 1859, in a cabin which stood on the northwest corner of Market and Eleventh streets, in Auraria. The house and business afterward passed into the hands of a man named Duncan, and from the character of effects produced by Duncan's liquor, the establishment became commonly known as "Hotel de Drunk."

On the 1st of February one of the Aurarians, David Smoke, opened his cabin as a public house, the first at Cherry creek. It was a one-story cabin, like all the others, had the soil for a floor, and stood on the southeast corner of Larimer and Tenth streets. To this hostelry he gave the name "El Dorado Hotel" and felt that he had done well his part.

Subsequently associated with Smoke was a queer genius, a Frenchman named H. Murat, who was commonly called "the Count," and who claimed to be a nephew of Bonaparte's King of Naples. The Count shaved men's beards and his wife did laundry work—occupations more useful than those in which noble personages usually engage. Little was known of the origin, identity and history of this couple who had drifted to this far country in those primitive days. They were of the large party from Missouri, eastern Kansas and southeastern Nebraska which arrived here October 24, 1858, and represented that they had come "from the upper Mississippi." Notwithstanding his charge of one dollar for shaving a customer, the Count in later years became an invalid inmate of the Arapahoe county infirmary, and died there. His widow still survives and resides at Palmer Lake.

When Mr. Greeley was here in the summer of 1859 the "Count" served as his barber. The exaction of one dollar for each shave and the charge of three dollars for Mrs. Murat's services in laundrying a half-dozen pieces of linen, led the noted editor to remark that the country harbored at least one man determined to make the best of his opportunities.

Mrs. Murat is frequently mentioned as having been the first white woman in the Cherry creek settlements. She was not the first, but the third; Mrs. S. M. Rooker and her daughter, of the Mormon family we have mentioned, were respectively the first and second; giving the mother precedence, though both came at the same time. The Murats soon after they arrived here went to "Montana" where they built a cabin. In the spring of 1859 they located in Auraria, where they remained until the spring of 1860 when they moved over to Denver City into a cabin they had built on the ground now occupied by the Chamber of Commerce building. Mrs. Murat claims to have made in 1859 the first United States flag fabricated in this region and which she floated from "El Dorado Hotel." She is now far advanced in years, but the other women at Cherry creek in 1858 are dead.

Early in February—about the 7th—William McGaa, Charles Nichols, L. W. Smith, Josiah T. Hinman and an associate named Morrow received from the Kansas Territorial Legislature a "charter" to run five years, to operate a ferry across the South Platte river at the mouth of Cherry creek; Nichols having procured the "charter" upon his return to eastern Kansas. The reader will recall that for the "benefit" of John S. Smith and McGaa the ferry privilege had been accorded and reserved to them by the Auraria Town Company when that organization was effected. John Smith gave it no further attention, and it appears that these "charter"-holders did not exercise their privilege; for Thomas Warren, a Kentuckian, at that time began operating the ferry from the foot of Eleventh street which, in anticipation of such a public convenience, had originally been named Ferry street. The new enterprise was a "rope ferry" contrived by stretching a heavy rope across the stream and making it securely fast at both ends to convenient trees. From the ends of a flat-boat other ropes reached to the thwart-stream one and were attached to pulleys running along on the cable. By lengthening one and shortening the other of these connecting ropes, the boat would be set at such an angle that the current impacting upon its sides, would send it across the stream. So, operating expenses were light and profits heavy. The ordinary charge for ferrying a wagon and team was one dollar, though Richardson, who was here in June, 1859, says his party paid two dollars and fifty cents. The ferry did a great business after the Clear creek gold discoveries, was far more profitable than the average mining, and called for little of the hard labor required in the mountains, gulches and bars.

William Denver McGaa.
(From a recent photograph.)

Another important "first event" came to pass in this period of Denver's development; one which afforded proof of enterprise and substantial progress, and which, because of its occurrence on the east side of Cherry creek instead of the west, was hailed as a most favorable and significant omen by the partisans of "Denver City." It was the birth of a son to Mr. and Mrs. William McGaa—the first birth at the mouth of Cherry creek aside from what may have previously happened in strictly Indian society. Hitherto published mention of this interesting event accords to it the date of March 3, 1859; but the descendants of this pioneer mother, including the principal figure in the domestic drama, say in letters to the editor of this work, that the date was March 8th.

At that time William McGaa was living in a shack or wigwam on the southeast corner of Fourteenth and Lawrence streets, where the old Methodist Episcopal church building now stands.

The mother was not an Arapahoe, as has so frequently been stated in published accounts, but a half-breed Sioux. She was a daughter of a white frontiersman named John Adams and a full-blood Ogallala Sioux mother, who later became, after the frontier fashion, the wife of Alphonse La Roque, a French trader, and is still living in South Dakota, aged eighty-eight years. They were at Cherry creek in the autumn of 1858.

Mrs. McGaa, a few years after William's death, married Joseph Brown, a Denver pioneer of 1858 and a shareholder in the Auraria Town Company. Brown is still living, at Pine Ridge Indian Agency, South Dakota. Mrs. McGaa-Brown died by drowning in the Cache-a-la-Poudre river at Laporte, Larimer county, in 1877, and is buried there. This information came from her sons, William Denver McGaa, and George R. Brown, the latter of the Rosebud Sioux Agency, South Dakota.

William Denver McGaa, Denver's first born, worked as a cow-boy in Colorado and Wyoming from the time he was old enough to ride until he was twenty-one. He then entered the government service at Pine Ridge Agency as Indian census-taker, herdsman, scout, guide, and interpreter, serving in those capacities about twelve years. In 1892 he was appointed Assistant Farmer at Pine Ridge, and taught the Sioux how to farm, and rear and care for cattle. In 1894 he became Indian Trader at Pine Ridge. He is now a prosperous stock-raiser in Pennington county, South Dakota, and has a most creditable record at Pine Ridge Agency and among the Sioux Indians. In one of his letters to us he said:

> "I am now in the cattle business and have over one thousand head of cattle; and quite a herd of fine, well-bred horses. Am married and have six children; the oldest, a boy, is named after myself,

William Denver McGaa, as I am proud of the name 'Denver,' and I want to have it remain in the McGaa family forever."

The inhabitants of the two towns had passed through the winter with a fair degree of comfort in their log cabins. They had plenty of fuel, and had prepared their houses to withstand severer blasts of the Frost King's icy breath than they had received. For most of them it was a first experience in a region where the winter winds might be expected to come sweeping and howling out of the wilds and solitudes of the great mountain ranges rising far above them close by in the west. It was fear of winter's rigors that had prompted some who had come out the previous summer and autumn to go back to their former homes with the purpose of returning in the spring, rather than brave the conditions of winter's sojourn here—conditions which many imaginations had surrounded with most appalling frosty terrors. But the winter had proved very mild, and far less rigorous than those from corresponding latitudes in the east had ever experienced there. The autumn had been a delightful one, merging far into the first winter month, and spring opened upon the communities before the people realized that they had actually passed through a Rocky Mountain winter without having been frozen to death or blown away, or both, as they should have been to have kept in line with the old stories they "used to read about."

Mrs. William McGaa.
(Photographed in 1874.)

Through these times and up to the first of the following May, when the stage-coaches began their trips, the people of the Cherry Creek towns had to depend mostly on chance opportunities for getting their mail and for sending their letters away. The nearest two regularly established postoffices were at Forts Kearney and Laramie, to which places messengers were occasionally sent on postal errands. This was not only a tedious way of doing, but an expensive one. The cost of getting a letter through was usually fifty cents, and as newspapers were so much more bulky, the expense was practically prohibitive to them and few were seen in Denver and Auraria. No feature of life here during the winter of 1858-59 was more trying, more wearing to those who bravely went through the experience, than this isolation; and in no way was the isolation more sensibly felt than during the long waiting for letters from friends beyond the plains. The intense feeling of homesickness it engendered led some of the heart-sick into lives of recklessness through a desire to escape the depression that wore upon them.

Therefore it was with great rejoicing that the people of both towns welcomed the trains containing the local outfit for the first overland stage and express line to Denver, which arrived late in March—on the 28th, in charge of Beverly D. Williams, who soon became a man of much worthy prominence and influence in the community. Auraria expected that the office would, of course, be located with her, but she was doomed to a bitter disappointment. Williams temporarily located the stage office in a building on Larimer street near Fifteenth, but soon afterward built a frame structure on the north side of Blake street between the "Denver Hall" and the northeast corner of that street and Fifteenth, on ground adjoining, or very near, the later site of the building in which the First National Bank began business in 1865. The alert Denver Town Company had promptly attended to that. Fossett, in his "Colorado," says the stage and express company—the Leavenworth & Pike's Peak—was given 1,460 town lots by the Leavenworth men as consideration for establishing its headquarters in Denver City; which would appear to have been a pretty heavy subsidy if town lots were worth anything. However, Fossett was

Mrs. Alphonse LaRoque.
(From a photograph.)

greatly in error in the number of lots in the subsidy. The express company was given fifty-three lots scattered over the territory between California street and the Platte river. The company also became the owner of nine shares in the Denver Town Company on the same basis as individuals, and on which it paid assessments the same as other shareholders. William H. Russell, President of the Express Company, personally became a shareholder, and as an addition to that interest six lots were donated to him. Referring to this transaction between the Denver Town Company and the express company, Colonel S. S. Curtis has well said:

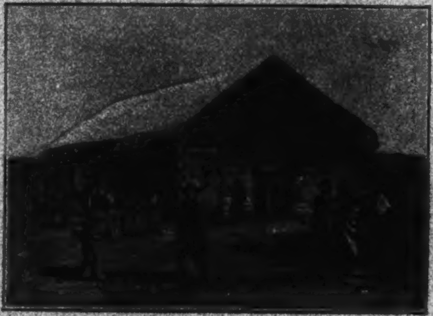
> "To my mind it was the vital move in the making of the city, as I believe that being the terminus of the stage line, thus compelling everybody to come or send to it for their letters, was what made Denver the commercial and financial center of Colorado."

Improvements in Auraria were fast moving forward, and that town was still much in advance of Denver City in population, notwithstanding the latter's encroachments upon her business circles. Many of the newcomers of this spring had, temporarily at least, halted there. A considerable number of people had arrived early in March and the increase in population was shown by an election—the first one—for "county officers" which was held on March 28th. Auraria cast two hundred and thirty-one votes; Denver, one hundred and forty-four; and there were three hundred and ninety-nine cast outside at five different voting places in the region round about, of which two classed themselves as "cities." Some details of this election appear elsewhere in this volume.

Early in the year Wooton had begun the erection of a business house in Auraria, that town's first business palace. It was built on the east side of Eleventh street between Market and Wazee, on the ground now represented by numbers 1413 and 1415 Eleventh; of hewn logs, and was two stories high; or, to be more exact, one and three-quarter stories. It was twenty by thirty-two feet, roofed with clap-boards or rived shingles, and had glazed windows, the latter being generally regarded as giving it a decidedly metropolitan aspect. The second story was reached by an outside stairway, and its floor was made of whip-sawed boards, the first planking, according to its owner's story, used in a Cherry Creek business house. Whether the building was finished before the large building of Blake & Williams, in Denver City, is questionable, as both were built at practically the same time; but Wooton's account says it was the first building in either town intentionally erected exclusively for business purposes.

As spring opened many new mercantile enterprises were advancing across the plains to the new metropolis of the far west. Some of these had set out the previous autumn, but hearing disturbing reports of Indian depredations, had gone into winter quarters on the Platte, in eastern Nebraska.

Several noteworthy business changes and expansions occurred at this time, notwithstanding the depressing effect which the delay in locating the gold-bearing lodes in the mountains had on the two communities. Blake & Williams left Auraria with their stock of goods and established themselves in Denver City. They had erected a log building on the north side of Blake street on the fourth and fifth lots from the corner of Fifteenth street. Constructed by the pioneer carpenters, Willoughby and Avery, it was a structure thirty-two by one hundred and ten feet in ground dimensions, and one story and an attic in height—the largest in either town. The accompanying engraving which is a reproduction of one of Richardson's sketches does not show the building as large as it was. In the absence of other adequate material it was roofed with canvas which served through that summer. Blake & Williams occupied part of it with their stock, and the remainder was used for "hotel" purposes, and in that capacity it was Denver City's first hotel. It was commonly known as "Blake & Williams' Hall," otherwise "Denver Hall." A short time later its owners moved their goods to another location, and soon afterward quit merchandising to engage in other enterprises. The building continued to be used for hotel purposes, with the usual drinking and gambling accessories, through the summer and autumn of 1859. It then degenerated into a "resort" of a vile and dangerous character, and still later became the "Elephant Corrall" headquarters, for which purpose it was used until it was destroyed by the fire of 1863. The building was the pride and headquarters of the town in 1859, and the favorite place for holding public meetings. Elbridge Gerry, a frontier trader, came to Denver City and assisted Blake & Williams in the management of their business. Both members of this firm became and long remained prominent and influential men in the community and throughout this section of the west.



The "Denver House," 1859.

Following Blake & Williams, the hardware men Kinna & Nye, left Auraria and located themselves on the east side of Fifteenth street, between Blake and Market streets, and on the southward corner of the alley. Their stock included some sheet-iron, and from this they fashioned the first stove made in what is now Colorado. It was a large affair for heating Blake & Williams' Hall, and they were paid one hundred and fifty dollars for it—a price that was most encouraging to the enterprising pioneer stove-makers.

About the first of April two saw-mills arrived from the Missouri river; one was brought by N. S. Wyatt and Hiram P. Bennet, and the other by D. C. Oakes, who had first come here in the previous autumn and had returned to his former home in Iowa for the winter. The Bennet and Wyatt mill came a few days before the other and was operated by an associate named Cooper. Oakes' mill was set up on Plum creek, about two miles south of what later became known as the "old Coberly place," and some thirty miles south of the mouth of Cherry creek; the Wyatt-Bennett mill was put in operation on Running creek, in that same general locality, where there was a good supply of standing timber suitable for saw-mill purposes. The mills were welcome additions to the resources of the towns, and immediately began sawing lumber for improvements. The first lot of it came from Cooper's mill and was delivered on April 21st to R. L. Wooton and Thomas Pollock, who built frame houses in Auraria; Wooton's a small dwelling, and Pollock's a two-story building at the southwest corner of Eleventh and Market streets for a hotel. Wooton claimed that his was finished first, which gave Auraria the credit of having the first frame dwelling, with Pollock's hotel as the second frame building at the mouth of Cherry creek. Subsequently Jones & Cartwright established a store in the Pollock building. Of his dwelling, Wooton says in his book:

> "After I completed my log store-building, I built a frame house for a residence, which by the way is still standing, and was the first frame building put up in Denver."

This pioneer structure is standing on the rear of the lot next north of the "Milwaukee Brewery," on the west side of Tenth street, between Larimer and Market streets; and is now used for a stable.

Soon after the first two mills were established another was brought out by a man named Little, and he was followed by Whittemore with the fourth one. The demand for lumber for the construction of new and better buildings in the towns was greater than the supply, and the output of the mills was absorbed as fast as produced, at prices ranging around the extravagant figure of one hundred dollars per thousand feet.

Amid all the confusion of the incoming troops of gold-seekers, the opening of stores, the racing up and down, the despondency over the elusiveness of the real cause for all of them being here, and the drinking and gambling, a few of the people found time and inclination for attention to politics. They declared that a new commonwealth must be organized at once. The particulars of what they did at this time and how they did it appear elsewhere in this story.

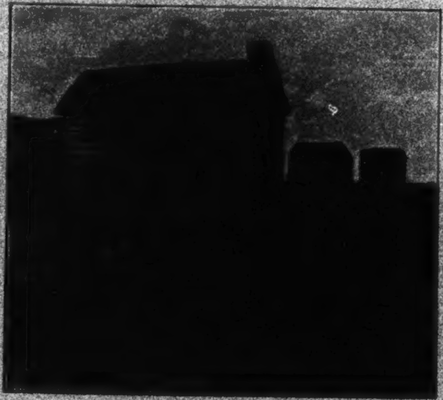
Among these would-be State-founders were ambitious and, let us say, clear-sighted men, intent upon the immediate creation of a new State here in the west, who pointed out that before three years could pass there would be in the Rocky Mountain country between Fort Laramie on the north and Taos on the south, a white population of more than one hundred thousand people, and that the sooner a State were organized the better it would be for everybody. They urged that this army of men in the full vigor of their prime, separated by many miles of Indian country from the existing States, should not be obliged to rely on their own resources, practically each for himself, for self-protection and protection of their rights and property, however able they might be to take care of themselves in an unorganized state of society. The Territorial jurisdiction of Kansas in this remote locality was a mere theory, and for all purposes of practical government and authorized enforcement of law the country might as well have been under the nominal jurisdiction of Massachusetts. They gave too wide a limit to their prophecy, for within a year after their first convention met there were one hundred thousand people, and more, too, in the region above defined; but it was a good many years before the hopes and ambitions of those pioneer statesmen were finally fulfilled.

On April 13th John L. Merrick arrived in Denver City with the first newspaper printing office outfit brought to Cherry creek. It was a small equipment with a small press, but it was capable of printing a little newspaper. Notwithstanding that Merrick's material reached here on April 13th he did not issue the first newspaper published here. Right behind him were the men who did that, for Merrick in the meantime had been indulging his somewhat convivial habits.

They were William N. Byers and Thomas Gibson, who were accompanied by John L. Dailey, an experienced practical printer man, and several others. They had started across the plains from Omaha early in the spring with a printing equipment, and upon coming to Fort St. Vrain, Dailey and Gibson halted there with the wagons while Mr. Byers went forward to Cherry Creek to see what prospects for their venture might exist here. Mr. Byers arrived here on April 17th, and quickly decided that Auraria was the place for them, whereupon the newspaper outfit was brought up, and drew into town on April 20th. Auraria was delighted by this important acquisition and by the fact that she had been chosen by its proprietors as its abiding place, instead of the boastful Denver City over on the other side. But her enthusiasm experienced a slight chill when the first issue of the Rocky Mountain News appeared bearing at its head the date-line legend "Cherry Creek, K. T.," instead of "Auraria City, K. T." But she had the newspaper, and her feelings soon warmed up again.

The outfit had been speedily installed in the second story of Wooton's "business block"—and this, by the way, made that structure the first "office-building" here, the herald of the magnificent edifices now gracing the city—and on Saturday, April 23, 1859, the first issue of the Rocky Mountain News was taken from the press that had traveled so far to perform that historic service.

On April 22nd, the day before the first issue of the News, the Auraria Board of Directors, without waiting for a printing press to have been maintained for a year before giving it a lot subsidy, as provided in their resolution of the previous autumn, met and adopted the following:



Wooton's Building; first of two stories at the mouth of Cherry creek.

"Resolved, That there be donated to Byers & Co. four Shares in the Auraria Town company for the establishment of a Printing Press; also that there be donated to Messrs. R. L. Sumner, E. C. Sumner, Thos. Gibson, and E. M. Byers [Mrs. W. N. Byers] one share each."

In the meantime John L. Merrick had established his outfit and was hastening to issue his Cherry Creek Pioneer before his rivals could place themselves in front of him with their News. In this he was about a half-hour too late. The Pioneer's issue of April 23, was its first and last appearance. Merrick traded its mechanical outfit to Mr. Gibson, of the News, for a little stock of provisions and some other things needed by a miner, and went up Clear creek on a prospecting expedition. Late in the summer of that year he returned and went to work as a compositor on the News, remaining with the paper until the outbreak of the civil war.

In an address recently (December, 1899,) delivered at a meeting of Colorado pioneers Mr. W. N. Byers gave the following circumstantial account of his coming to Denver and bringing his newspaper plant with him:

"The discovery of gold in Colorado was the signal for a considerable influx of adventurers this way. My home at that time was in Omaha and I saw a good deal of the people who were going back and forth to the West. Some of those who were returning carried with them samples of gold dust in goose quills. I naturally took an interest in the new country. One day in the winter of 1858 and 1859 some gentlemen were in my office in Omaha and the suggestion was made that it would be a good idea to bring a printing press to this country and print the news of discoveries from the point where the discoveries were made. I was instructed to go ahead and purchase an outfit. I went to Bellevue and bought a printing press and brought it up to Omaha, where the machinery was set up. Some of the type was set up and two pages were printed. Everything was in shape so that it was easy to get out a paper as soon as we arrived in this place.

"We left Omaha on the 8th of March, about the time the frost had begun coming out of the ground. We encountered a great many difficulties, but on the last day of March we reached the banks of the Platte river opposite Fort Kearney. I was wagon boss, and I used a little ingenuity in distributing my train along the road, apprehending that my party might object to crossing the stream —which was then running high—if an opportunity to confer was given. So, I got the first wagon into the water before the drivers of the others had a chance to protest. I had learned never to camp on the near side of a stream. The others were very indignant, but I pushed them all in successively without giving them a chance to compromise; whereupon each became still more opposed to the proceedings. The heaviest wagon got into a sink-hole of quicksand and we did not reach the other bank until dark. There was no road on the other side, but we managed to get through the night. If we had not crossed the river that evening we would have been, as matters turned out, delayed several days; for the next morning the river was full of floating ice that did not disappear for nearly a week.

"We located a camp at St. Vrain so as to give some of the men a chance to prospect. I then went on in advance and reached here April 17, finding the people were a good deal more anxious about the arrival of the newspaper than had been reported.

"At the beginning of the second day I sent a messenger on horseback to hurry up the train, and two days later it arrived. One of the wagons stuck in Cherry creek—at Blake street, so we did not get across until after nightfall. I immediately drove over to the little office I had secured. Old Uncle Dick Wootton had built a log cabin which contained a little attic and this he had offered to me. There we set up our press and began setting type. I have here the first sheet that was printed.

"We improvised a shelter under the roof to protect the press. This was a sort of tent. The clapboard roof of the building was covered with snow, which, as it melted, ran through upon us. Before the first issue of the paper was made a little dodger was struck off for a man who had lost a horse and a dog. This was the first printing done in this territory.

"Now, there was another paper came out that same evening called the "Cherry Creek Pioneer." When I was at Fort Kearney I heard that a man named Merrick had preceded us by some days. He did nothing until we arrived and then he became very anxious to print a paper too. He got a log cabin and started to work. The result was to get out a paper the same evening. The citizens constituted themselves a committee to see which of us got out first. The consensus of opinion was that we came out twenty minutes ahead of the other. This paper of Merrick's was issued only once. The next day he hunted up my partner and sold his outfit for some flour and bacon."

We shall, of course, go much further into Denver newspaper annals, but at this juncture will only add the following from the narrative of the gossipy Wooton:

"The first newspaper published there was started in 1859 by W. N. Byers—who still lives in the city he has done so much to build up—and was printed in the second story of my log 'business block.' It wasn't a very pretentious sheet, and was published under great difficulties. Sometimes the publishers were able to get hold of the right kind of printers' supplies, and sometimes they failed to get hold of anything better than fools-cap or wrapping paper, upon which to print an issue of the old 'Rocky Mountain News,' now a great metropolitan newspaper keeping pace with the growth of the city and this rapidly developing western country. The difficulty of procuring printers' supplies was not the most serious with which the publishers of this pioneer newspaper had to contend. * * * About the first question Byers asked of an employe in those days was whether he could handle a gun to good advantage, and a printer who was handy in this respect, stood well with the proprietors of the paper, even though he had a multitude of shortcomings as a compositor."

Wooton does not mention another serious difficulty encountered in publishing the News in those days. The sale of liquor constituted a large part of his business, and frequently his customers would become boisterous, and very reckless with their weapons. Some of the newspaper men slept in the printing office, and as a safeguard they found it expedient to lay an extra thickness of planks under their beds to intercept stray bullets which, fired at short range, could pass from below through the single flooring of the room. Wooton's establishment became a rough one, and later it had a bowling-alley attached to it. Subsequently, after having been put to so much better uses, the vacated second story became a noted gambling room.

The managers of the Town Companies were not idle during those winter and spring months of 1859. On January 14th the Aurarians made a sort of "lot dividend," as provided for in the following, adopted by their Board of Directors:

"Resolved, That each and every Original Stockholder be entitled to one choice lot for each Original Share he may own, said lots to be selected by the Stockholders out of any lots in the City that have not been selected or otherwise appropriated by the Board; but in no case allowed to select more than two corner lots."

At this meeting the Directors also "granted E. Karczewsky privilege of selecting a lot for the purpose of building an ice house."

On the 17th of January these Directors resolved that "there be and is hereby Donated to the Masonic and Odd Fellows' Associations one lot each." Their generosity did not end with this, for, at the same meeting, they resolved to give a lot each "to the first four Religious Societies" that built churches in Auraria.

Rocky Mountain News' office, second story of Wooton's Building, 1859.

The hotel projects which had been given lot subsidies in the previous December do not appear to have promised well, for the Auraria Directors at this meeting of January 17th, adopted the following:

"Resolved, That there be Donated to Messrs. Dudley and Russell twenty lots to construct a Hotel of the following dimensions, to-wit: to have a combined front of two hundred feet on two streets, two stories high, to be finished for the reception of guests by the first day of July, 1859; they to have the privilege of selecting the lots."

On the 18th of February they donated one share in the Auraria Town Company to General William Larimer of the Denver Town Company, as an official courtesy. They also appointed a committee of three "to confer with a like Number of the Several Town Companies for the protection of Town Sites from mining operations."

A large part of the business before the Auraria Directors in the first four months of 1859 was that of donating lots to persons who agreed to build on them. Such donations were made to James Knight, and Daniel Knight; two lots to H. Murat provided he built two houses, each twenty by one hundred feet in size, one and one-half stories high of hewed or sawed lumber—which he did not build; to R. P. Smith, R. L. Wooton, Thomas Pollock, "Mr." Boughton, William Hilliard, "Mr." Foster (the surveyor), "Mr." Ming, Jarvis Richardson, and Heifman and Brauner; to 'Jessey' Heismar, one share; one share to "Messrs. Gilman, Edwards, Thompson and Putman—one lot each;" to William Parkinson six lots on which he was to build three houses, one forty by eighty, and the others twenty by thirty feet; to D. W. Griffith, G. F. Griffith, W. H. Bassett, and R. H. Lusby, one share each; a lot to Wooton "for the purpose of building a store-house;" a lot each to H. P. A. Smith, N. G. Wyatt, J. W. Cooper, John J. Riethmann, "Marshall" Cook, James Winchester, P. Halsey, W. J. Boyer, H. E. Hunt, and J. T. Younker; to D. D. Cook, Allen Ira Town, and L. M. Beall one share each; and to Governor S. W. Beall four shares.

Many of the original "stockholders" in the Auraria Town Company did not build on the lots assigned them, and a large number of the donation lots were not improved. On January 14, 1859, the Directors had 'rescinded' most of the donations made in the previous two months, and scolded the derelict original "stockholders" for their delay in making improvements. Indeed, the record shows that through that winter and spring the Directors were almost continually threatening and haranguing the laggards, and frequently declaring donations to have become void. It was an exceedingly paternal form of town government in which "the Board" claimed jurisdiction over everything. "Improvements must not be made without the Company's approval," is one recorded fiat of this period. Judson H. Dudley sold a lot to a newcomer in the spring of 1859, but "the Board" denied his right to do so and resolved that "we hereby cancel said sale," after which the Directors generously donated the lot and three more with it to the pioneer would-be investor.

Then they had a rumpus with John S. Smith and William McGaa who were claiming more than "the Board" thought they ought to have, which led to the adoption of the following on April 1st:

"Resolved, That in the contract with William McGaa and John S. Smith for their claims it was distinctly understood by the Auraria Town Company that the said William McGaa and John S. Smith, their heirs or assigns, were to have all the lands laying north of front street and south of the Platte river; commencing at the North East corner of said town, thence running westwardly along the line of Front Street to the Platte river, thence following the meanderings of said River down to the mouth of Cherry Creek. The Said Town Company claiming and reserving the right of way through the said lands for Streets and Alleys."

This was followed on April 8th by Smith's resignation as Treasurer and his declaration that he would have nothing more to do with them. The Directors elected as his successor, John Scudder by whom in an encounter with P. T. Bassett of the Denver Town Company, a few days later, the latter was killed. Scudder left the settlements, and on May 18th Thomas Pollock was elected Treasurer "to fill vacancy occasioned by the absence of John Scudder."

The intense rivalry between the two towns indirectly gave rise to the causes which resulted in Bassett's death. He had been a Missouri river steam-boat Captain, and was of an arbitrary disposition. As was afterward shown, he had defamed Scudder in consequence of some personal differences and feeling that had arisen between the two. On the morning of April 10th they met at Bassett's cabin, on the south side of Larimer street between Fourteenth and Fifteenth streets, when some words about the reports circulated by Basset ensued. Bassett at first denied them, but becoming angry said he was responsible for them; and seizing a pick-handle, according to the later testimony, made at Scudder, who then fired and mortally wounded him, death ensuing before the next morning. Scudder left Denver and went to Salt Lake, where he remained nearly a year, engaging in the meantime with William H. Russell in preparing for and outfitting the Pony Express. In the spring of 1860 he voluntarily returned to Denver and asked to be tried for his act. A People's Court was organized with Charles A. Lawrence as Judge, and the trial took place on April 18th. The testimony presented proved his act to have been in self-defense and he was unanimously acquitted. In the trial his case was presented by H. P. Bennet, and John C. Moore; while the prosecution was in the hands of W. P. McClure. Scudder subsequently engaged in mining operations with William H. Russell, with whom he was associated many years. He is still interested in mining and is now a citizen of Denver.

The Directors of the Denver Town Company were also employed during these times on about the same lines as those followed by the Aurarians. The major portion of the entries in their record are concerning "grants" and "donations" of lots; the grants being for some unusual and important improvement, and the donations for the ordinary consideration of houses being built by the recipients. As in Auraria, many donations in Denver City were "rescinded," and with all the doings there was also much menacing scolding of the non-progressive citizens. It is plain to be seen that the managers of the pioneer towns did not always lie on beds of roses.

At a meeting of the Denver City Directors held January 22, 1859, William McGaa made a proposition "to build a building 300 feet long with houses not less than 16 feet square, to be completed on or before the 1st of June next; the buildings to be hewed logs, and good, merchantable dwelling houses, or stores, or offices, for which Mr. McGaa asks one-half block, or Sixteen lots together. Said lots to be selected by Wm. McGaa, assisted by the donating agent, and at a point not now taken by individuals, and in the direction of the Court House."

This proposition was accepted, but William McGaa never went any further with his ambitious enterprise, with its three hundred feet of stores, offices, and "good, merchantable dwellings."

At this same meeting the Directors expressed their dissatisfaction with the progress of the town survey by resolving that the Treasurer be instructed "not to pay over any more funds on surveying to Messrs. Curtis & Lowrey until further orders from the Board." This was not a great hardship to the surveyors for the poor men were getting in driblets only a little "funds" for their work.

In common with their neighbor officials on the west side of the creek, the Denver City officials were having continued bother over improvements on donated town-lots. Buildings were not erected by some according to stipulations, and the Donating Agent was not always making himself agreeable to the Board. On January 29, 1859, the Directors resolved that that officer be instructed "to stop donating lots; that all donations, if any, be referred to the board of directors hereafter." According to their record the Denver City Directors did not meet again until the 8th of the following May.

In April, Recorder Bassett was succeeded by Richard E. Whitsitt. who also acted as Donating Agent, and general manager of the company's affairs. The duties of this first-named position, as we have stated, were to make assignments of lots to all who would engage to build on them within a stipulated time. Whitsitt made provisional "deeds" for these lots, and when conditions were complied with saw that the company's "regular deeds" were given. In making lot donations the Denver Company was careful to so assign them that their improvement would enhance the value of those it retained.

While General William Larimer was a leader among the energetic and forceful men who organized the Denver Town Company, his immediate associates in that enterprise possessed a full share of requisite qualities. This was conspicuously so of Richard E. Whitsitt, who was a man of ability, decided force of character, and fairly educated. He had operated in real estate at Leavenworth and elsewhere in eastern Kansas during the then recent era of mushroom "boom cities" in that section, and his experiences accumulated there probably suggested the course he and his associates followed here. Indeed, the party included none who lacked energy and fertility of resource. After the death of Bassett, Whitsitt had practically full control of the Town Company's affairs.

A great tide of immigration was now rolling in bringing with it many new and important business enterprises, and the towns were in a turmoil. The discovery of the mother lodes had not yet come, and the streets were crowded with noisy, discontented men lamenting their folly in coming to such a country and denouncing everything and everybody in it. But the long night of waiting, and groping, and hoping was about ended; and the golden sunrise was nearly at hand.

The most important event of these times in the history of the two towns, aside from the great gold discoveries, was the arrival of the first coaches of the Leavenworth & Pike's Peak Express Company which had been making its preparations throughout the spring. On May 7th two of the company's coaches swung gaily up to the previously located stage office in Denver City, nineteen days from the Missouri river. A construction train accompanied them, and it was because of work that had to be done along the way, that the initial trip took so much time in covering the distance from Leavenworth, which by odometer measurement was six hundred and eighty-seven miles. These coaches and their accompanying trains, which were in charge of B. D. Williams, made the first tracks on the greater part of the route, which was by way of Fort Riley and the divide between the Solomon and Republican Forks, to the Republican river between the one hundred and first and one hundred and second meridians. Thence following that stream to near its source, thence across Beaver, Bijou, and Kiowa Creeks, through the pineries to Cherry creek, and thence along that historic alleged water-way to Denver City.

Leavenworth & Pike's Peak Stage office, 1859.

The late Henry Villard was the only passenger on that trip. In a reminiscent paper which he recently prepared and deposited with the State Historical Society, and from which we have derived valuable information, he states that his fare was two hundred dollars. This must have been a special price for the regular fare was soon fixed at one hundred dollars.

With the advent of the stage-coaches communications by mail became regular, and, as compared with previous conditions, very expeditious, with half the attendant expense. But the miners in the mountains had either to come here for their mail or have it carried out by the makeshift local expresses which began operating irregularly to and from the town. When the regular stage-lines became established between Denver and the mining camps, the carriage of mail at twenty-five cents a letter grew into a large and profitable part of their business. Most of them had pretty rough roads to travel. In going up Eight Mile canon on the way to Mountain (Central) City, the stage crossed the little canon creek fifty-eight times in the course of that eight miles.

By the middle of June many new buildings had been added to both towns, and the saw-mills had been instrumental in making a number of the later ones of a much better character than the primitive constructions of unhewn logs, though some of the newest ones were of hewn timber. Auraria was much in advance of Denver City, both in the number of her edifices and in population, having upward of two hundred and fifty buildings to the approximately one hundred and fifty of her rival. The two places contained about one thousand more or less permanent inhabitants. With the great inrush of people bound for the "gold diggings" any way and every way, but how and where they did not exactly know, there were many who were predestined in their calculations to stop in the Cherry creek towns to engage in business, to engage in speculation, to engage in anything that might happen to turn up; and more than were necessary, who came hither to engage in hook and crook. In this great tide additional individual enterprises in new business undertakings were lost sight of from a historical point of view, and the greater number of them can no longer be separated into their chronological order, even if it were desirable and important to do so.

But neither of the towns had flung away ambition to over-shadow, outstrip, and eventually absorb the other and wipe it off the face of the earth, in name, at least. The softening, soothing influences of that open-headed barrel of Christmas whiskey did not outlive the holidays, and the jealousy and rivalry were now as great as ever. About this time Auraria, among her other accessions, attained the distinction of Pollock's new hotel built in two stories. This was also pointed to with much pride, and held out as further evidence, if that were needed, to justify her claims of superiority. At this moment Denver City had not gone more than one and one-half stories from the earth, except in the mental flights of some of her partisans; and this new, double-storied hotel building across the creek was reluctantly admitted by them to indicate some progress over there.

* * *

CHAPTER XXVI.

Depressed Conditions in the Spring of 1859—Their Causes—Slow Progress of Prospectors and Meager Results from Mining—Memorable Panic Among Immigrants—Vast Host of Gold-Seekers—Prospecting the Platte River—Discoveries in the Boulder District, and Operations Elsewhere—Work of Experienced Miners—The Great Discoveries on Clear Creek in the Mountains.

In the spring of 1859, notwithstanding the progress they had made, the settlements at the junction of Cherry creek and the Platte river had sat holding their heads in discouragement that was as near despondency as it was safe to be. Some gold had been found, it was true, but it was disappointing. There was a little here and a little there, but all of it put together was nowhere near enough to pay the expenses of finding it. By the middle of April there were more than a thousand people in Auraria and Denver, and as many more scattered around within a radius of twenty-five miles, the large majority of them the heralds of the army that was then stretching across the great plains from the Missouri river, in several different lines, but principally up the Platte valley; and there were indications of a panic at Cherry creek.

Though the season was not far advanced, many people who had early arrived that spring had left the district in angry disgust after their brief stay of a few days; and many more were profanely talking about pulling out from the scenes of their misplaced confidence and withering hopes. Town lots were cheap, and getting cheaper every day; and it was a simple sum in arithmetic to figure out and fix the time when their lessening value would finally pass away, like a pool of water evaporating under the rays of a summer sun.

One-fourth of the cabins began that spring on both sides of the creek had been left unfinished by their projectors; another fourth were now vacant, or about to become so; and the remainder were mostly occupied by dispirited souls who thought they saw their dreams fading away in the pure, crystal air of the mountains. True, many of the absentees were off prospecting, climbing over the ridges and delving in the creeks and gulches; but if things continued as they were then drifting, what would become of the twin towns, born of hopeful enthusiasm, laid out with due consideration for the main chance, but now hanging on the edges of several unwelcome probabilities? Immigrants were arriving daily, but they had been somewhat disheartened by the tidings heard on the closing stages of their journey, and now were still further downcast as they more fully comprehended the situation.

This depression which prevailed among the majority of those congregated around the mouth of Cherry creek, was not without cause.

Gold had not yet been found in amounts to justify any excitement, notwithstanding the previous anticipations that the spring months would bring great developments. However, the experienced miners on the ground were still of the belief that it was here in great values. Very few of the new arrivals knew anything of surface indications, or of the methods of mining. They stood in need of a course of schooling, but until mining had begun in earnest they could learn nothing. Other employment here, at that time, was out of the question; there was comparatively little for anybody to do that each could not and would not readily do for himself. If gold failed, every man would have need for every resource he possessed, in getting out of the country.

There are men living in the Denver of to-day who were here in the Denver of that day, and who stayed here through the years that lie between. Their experience is one which falls to the lot of few in the brief interval set apart as man's lifetime. They have seen those poor, dejected little hamlets of the spring of 1859, hundreds of miles from the nearest civilization, become a great city noted all around the world for its beauty, its wealth, and its prosperity.

In every community of men, large or small, there are certain hopeful, sanguine spirits to whom no difficulty seems too great to be overcome, no prospect one of unrelieved gloom; no misfortune can cast them down, no disaster appall them. Such as these were here on Cherry creek in the times we are considering, and never lost their faith in the existence of rich gold-fields in these mountains, nor in a brightening future for their sorry little settlements. Their confidence in the presence of gold in plenty could not be shaken, but the question was to find it.

A relatively large number of men had been engaged in the hunt along the Platte river and in its tributaries up and down from Denver. The sandy bed of Cherry creek had been literally clawed over for miles from its mouth. Some of these industrious workers, happening upon favored spots in the bed of the South Platte and of some of its insignificant tributaries, washed out several dollars' worth of dust each day; but such places were few, and their resources did not last long. The beds of the streams in this vicinity showed traces of gold nearly everywhere, but the great majority of the men toiling in them did not recover sufficient to buy their daily beans and pork. The work done in most of them in March and April, 1859, had not, according to the estimates of that time, realized an average of fifty cents daily to each of those who were engaged in it, while at the same time the cash cost of a man's food for a day was about one dollar, and he would have to limit himself to the plainest and cheapest kinds, at that.

It is doubtful if the total quantity of gold found in the entire Pike's Peak region, up to May 1st amounted in value to ten thousand dollars; yet, many times that amount had been expended directly and indirectly, by the hundreds engaged in the search—in preparation for coming here, in crossing the plains, and in maintaining themselves after their arrival. Notwithstanding these meager results the hopeful ones, unshaken in their faith, still told rosy stories in letters to their friends in the east.

The first tide of the spring flood of immigration was now pouring into the country, and those behind it made two or three streams of eager humanity flowing westward from the Missouri; great rivers of emigration rolling over the plains toward the Rocky Mountains. The reflux of the disappointed, the impecunious, the disillusioned, and the disgusted already made a fair-sized stream headed the other way. The crudest ideas of gold-mining possessed the great mass of these people. In only rare instances had any of them the slightest practical knowledge of the work before them. Very few of them knew how or where to look for gold, and few of them would have recognized it if they had fallen upon a lead.

They had left home with the most sanguine anticipations of speedily becoming owners of a bit of creek or gulch or river lowland, where they would quickly uncover a fortune or, in the remotely considered possibility of not doing this, in confident expectation of earning ten or fifteen dollars a day under those who had such gold-bearing possessions. Thoughts of failure and disaster had not accompanied those whose faces and footsteps were toward the west. Coming under such inspiring delusions as these, weary, dilapidated and weather-beaten by the long journey, the conditions here were an astonishing revelation to them. Finding only a small community of mostly discouraged men living in a few rude log huts, was amazing and sorely disappointing. Some who had arrived earlier in the spring, were so downcast by the situation that they had immediately turned around and quietly made back for home.

While "the gold diggings" were always associated with Pike's Peak by the swarm of immigrants, that lofty mountain was usually regarded as the central land-mark of a large region rich in gold. The first settlements by gold hunters in this favored country having been made at Cherry creek, this point had become the objective for the multitude of strangers in a land as strange to them as they were to it.

Before the middle of April, individuals and small parties, making a considerable number in the aggregate, had been daily starting back to the east, warning in tones of dejection, all they met on the way, of the futility of the westward journey; but without any exaggerated, panic-inciting embellishments, and without seriously alarming many of the sanguine west-bound host. After the middle of that month, however, the discontent here had much increased, and about seventy-five men had left Denver together, on the 16th, to make their way back to the Missouri river.

In camp at Cherry creek, spring of 1859.

The death of an immigrant named Biencroff, by violence, had occurred here about a week before, and some thieves had begun their work. The discontented ones reasoned that if robbery and homicide were to be added to the troubles they already had, the time had come to leave such a country. So, this organized party of malcontents started down the Platte valley, many of them on foot, without equipment or provisions for the long journey to the Missouri river, spreading the most extravagant stories of disaster and ruin in the region they were leaving.

Some of the immigrants they encountered and turned back by their alarming tales were almost in sight of Denver. These, added to the original party, soon made a panic-stricken throng headed to the east, which increased in size like a rolling snow-ball. Every man who was turned back added to the apparent weight of evidence, and by that power which crowds have to create a feeling of excited apprehension, a fast-increasing number was made to share in the panic, and join the flight toward the Missouri. So, back they went down the valley like a drove of stampeded cattle, with as poor an understanding of the real cause for alarm, as they had of the country from which they were fleeing, or of the business they had expected to do in it.

The panic-breeders declared that utter lawlessness was in command at Cherry creek, and that neither life nor property was safe there for an hour at a time; that many of the pioneers accused of having aided in "deceiving the people" as to the character of the country and that of the gold diggings, had been hung by the infuriated mob; and that Auraria had been burned by the enraged immigrants who had been misled into going there.

With the facility that bad news always makes its way over long distances, these evil tidings spread over the plains along all the routes of travel. It was estimated that one hundred and fifty thousand persons left the Missouri river for the Pike's Peak region in the spring and summer of 1859. Of these, not less than fifty thousand were turned back by the senseless panic that prevailed.

The men who started it found their reward in free transportation and free provisions for the backward journey, and their victims probably felt grateful to them, beside. The return began far up the Platte, and many whose wagons were loaded with merchandise for sale in the mines, and which represented the owners' fortunes, or with property for their own use, began throwing away the goods rather than tax their weary oxen to drag back the loads five hundred or six hundred miles to the river. The trail was strewn with stuff of every description for hundreds of miles, and no one knew the money loss represented by all this abandoned property lining the wayside. An aggregate of probably one hundred thousand people pushed on to the mountains that year, but far less than half of them remained. Some stayed but a few weeks, while many others held out until autumn, and then went home for good before winter set in.

A few men were vehemently execrated by those who inaugurated the panic and those who were persuaded to share it. William N. Byers and D. C. Oakes were especially the objects of this unfriendly feeling.

Major Oakes, the leader of the party that arrived here October 10, 1858, had returned east late that autumn to remain through the winter. While he was here he had, of course, learned from "the Russell boys" all particulars of the Russell company's operations through the summer, and of W. G. Russell's intention to return with a large company in the following spring. When Oakes reached his home in Mills county, Iowa, he published all he had learned that season of what had been done here—and perhaps a little more—in the form of a pamphlet under the title "Pike's Peak Guide and Journal." Beside the embellished accounts of gold discoveries, it contained such other information about the western country as was then at hand. Though it was printed in the little town of Pacific City, it was widely sold.

At that time there were many such publications circulated in the east; most of them written by men who were never west of the Missouri river, but this one was issued by a man who had been on the ground. There was a great demand for such books, and they were partly instrumental in causing a large emigration to set out for the mountains in the spring of 1859, as soon as the grass began to start, and even before. Oakes returned to Denver early that spring in time to hear some exceedingly frank criticisms of his book.

Mr. Byers reached Denver in April of that year with his newspaper plant. Early in the preceding winter he, too, had published a "Guide to Pike's Peak," which had been extensively sold to the emigrants. It was a compilation of current reports, instructions as to routes, localities and the like, and contained much needed information. The day before its author reached Denver he encountered the men who had left here on the 16th, and who, when they ascertained his identity, threatened and denounced him for having made statements in his "Guide" that were not borne out by experience, and for raising hopes and expectations that failed of fulfillment at Cherry creek; misfortunes for which he was in no way responsible.

But the burden of censure was put upon Oakes by these inconsiderate insurgents, because he had been first to represent "Pike's Peak" as a mining region. He was held in the greatest disfavor, and new expletives were invented for especial application to him and appropriate to the assumed enormities of his offense. General William Larimer and Henry Allen also came in for a liberal share of the blame.

Along the trails near Denver effigies of Oakes were pretended to have been buried in several places at the wayside. At one alleged "grave" a buffalo skull bearing these lines was planted:

> "Here lies the lies the bones of Major Oakes,
> The author of this God-damned hoax."

At another "grave" the following more specific statement of Major Oakes' alleged fate appeared:

> "Here lies the bones of D. C. Oakes,
> Killed for aiding the Pike's Peak hoax."

The stampeders when they left here vowed they would kill both Oakes and Byers if they could lay hands on them, but the gentlemen escaped destruction and became most useful citizens of Denver. Hostility toward them was cultivated all along the retreating line, by those who had exhibited as little common sense in their way of going back as they had in coming out. On the basis of unproved statements in countless rumors and many "Guides," their unbounded credulity had led them to put off pell-mell for the mountains to get into the front rank of the gold-seekers. Their accounts of the state of things here were ten-fold more exaggerated than any of the statements made by the guide-books they so bitterly condemned, apparently trying to balance one lot of mistaken representations by a larger installment of extravagant misrepresentations. They were successful in their undertaking even if they were failures in everything else they set out to do in the western gold country.

In these early days the South Platte river received much attention from the miners, if it be proper to call such a crowd of embryos, generally, by that name. It never proved itself worthy the labor and anxious hopes bestowed upon it, and never gave much in return for them. Many men conceived its bed to be, from the topographical necessities of the situation, a great depository of placer gold, and months of hard and comparatively fruitless toil was required to cure them of their error. Several of its small tributaries were far more generous, each giving up more of the yellow dust than the greater stream yielded from the beginning to the end of the placer mining in all the diggings around here. In its time it must have received from the mountains a prodigious amount of gold, and likewise in its time it must have scattered it far and wide for many miles down its broad valley, for it once was a mighty river with Capitol Hill as its eastward bank, while its waters lapped the base of the foothills on the west. But that was some time before the Leavenworth men jumped the town-site of "St. Charles," and re-laid part of the foundations of Denver.

The winter of 1858-59 had been a mild one and considerable prospecting had been done, and a few discoveries were made. A party that had settled itself on Boulder creek in October had been joined by several others later in the year. These men kept at their search. In January, James Aikins, I. S. Bull, Charles Clouser, William Huey, W. W. Jones, and David Wooley started to explore a canon near their camp, and after going about twelve miles found, on the 15th of that month, some gold deposits which later in the year were developed into important mines. From this circumstance they named the canon stream Gold run, and the place of their discovery Gold Hill. About the close of January B. F. Langley came upon some placer or bar prospects in a gulch on South Boulder creek in which there was a lot of fallen timber; and by that token the place was afterward known as the Deadwood Diggings. Langley took out some gold from his bar, but, like the Gold run discovery, the place did not open up at its best until the following summer when the country was crowded with people. A considerable company of men worked in Deadwood through the spring months making fair wages, but all the while it was evident that it was only a matter of a few months more before the Deadwood placers would be cleaned out.

Boulder creek, as its name suggests, was so called from the quantities of boulders of all sizes with which its bed was filled. This creek had received much careful attention from the prospectors up to this time, because it looked as if there ought to have been gold in it almost anywhere.

A few weeks after Langley's Deadwood discovery James D. Scott found a gold bearing quartz vein near Gold Hill, and named it after himself. The decomposed material yielded some good values in sluicing, but there was not enough of it to justify any enthusiasm at that stage of the proceedings.

The foregoing covers about all that had been accomplished on the Boulder up to the first of May, the rich and locally celebrated Horsfal discovery by William R. Bloro, David Horsfal, and M. L. McCaslin not having happened until the 13th of June. In that and the next season the Horsfal lode yielded about ten thousand dollars, and in 1861-62, the Gold Hill Mining Company, by improved methods, took from it upward of three hundred thousand dollars' worth of gold. It was out of these discoveries that the flourishing town of Boulder eventually grew.

In other directions even less had been done by the close of April, toward justifying the variegated rumors that had gone forth to tell of the riches of the Pike's Peak region, and which had been the inspiration for the army of fortune-seekers marching across the plains, with its advance columns already at the mouth of Cherry creek vainly and indignantly demanding to be directed to the gold mines without delay. Early in the spring, several men from Denver and Auraria found gold in Ralston creek. The place for a short time yielded in encouraging quantities, and then passed away from the possibility of possessing any permanent value. The gold was in the form of what may be described as flattened shot, or a kind of scale. From this it was correctly inferred that it had come from some distance up in the surrounding mountains, and had been flattened by tumbling around in the creek among the loose, smaller bowlders, when the stream became a torrent, as it frequently did. At Arapahoe—to which we shall again refer—a short distance east of where Golden is now built, some emaciated diggings had been opened and were being worked by a few men who were having a hard time to keep even with the cost of their daily supplies from the results of their labors. Several parties were trying to squeeze something more out of Dry creek with most indifferent success, and hundreds of men were in the mountains and along the streams laboriously hunting for that which they had not yet found.

This was the situation when the host of 1859 began to tramp into Denver by platoons and columns, in extravagant expectation of going to work next morning to begin piling up the fortunes they had come here to take from mother earth. It was a sorry feast of scant loaves and little fishes that Denver had to offer the fiercely hungry multitude that was sweeping down upon her. About the best that can be said of what had been done up to this time, is that it fully confirmed beliefs that great deposits of gold existed somewhere in the region round about.

The worst of the difficulties had been and still were the inexperience, the ignorance, of the people who had suddenly, over night, been transformed into alleged gold-miners. Ninety per cent of the men who then were crowding the few streets of the Cherry creek towns, would not have recognized the richest quartz as having value unless it carried gold in particles large enough to be plainly visible to the unaided eye; and even then the problem of extracting it would have been one beyond their powers of solution.

As the reader will have observed, practically all of the operations had been confined to the beds of the streams where, buried under the sand and silt, visible gold, in grains and small, very small, nuggets, had been found. About all the values that had, up to this time, been recovered, were taken from such uncertain places; and of these only a few had proved temporarily profitable to the limited number of men who had found them. But this was the kind of mining the multitude anticipated could immediately be done by everybody, with most lavish gains. It is not an exaggeration to say that the majority of the throng of the spring of 1859 expected to find a good place anywhere they might alight within sight of Pike's Peak, and that their labors would be limited to easy digging and shoveling, and sacking up the product.

So, we need not be surprised by the accounts of the prevailing and profane wrath, the cruel disappointments, the revilings, the self-reproaches that broke out among the thousands of new-comers that spring, when they realized the situation in all its grim aspects; or that the sickening truth should cause droves of these mistaken men to wheel about and forthwith go back the way they came, with bitterness in their hearts, and maledictions for the country on their tongues. It was a harsh awakening from their golden dreams.

But these conditions and circumstances bring out in bolder relief the courage and faith of those who did not turn on their heels and leave in hostile anger, and the fortitude and patience of others who had remained steadfast and hopeful from the days in which Denver and Auraria had been founded. Not all the heroes are developed in the din and horrors of battle, nor are all the great captains in the undertakings of men found in the armies for war. Peace hath her victories, but rarely a greater one than that which came to the pioneers of Denver, when needs were great and hopes had been long deferred. There were causes in plenty for the municipal despondency which, about this time, afflicted the rival settlements at Cherry creek, and should have brought to each a feeling of forbearance and sympathy for the other, as both were being dragged toward the valley of humiliation.

Blake street eastward of Fifteenth, spring of 1859.
(One of the Richardson sketches.)

Among those who were carefully searching the mountain streams and gulches for the precious metal, were a few men who had learned their business in other regions. With the great majority of the prospectors the work was a hap-hazard undertaking, made so to a great degree by their ignorance of placer or any other kind of mining; but to the self-trained men from distant fields who understood what they were doing, or trying to do, the task was less laborious, and far more likely to be rewarded by good results if gold really existed in profitable quantities in the eastern ranges of the Rocky Mountains. They were looking for the gold-bearing veins or mother lodes whence came the gold that had been found in the bars and creek-beds, and knew that until they were found the problem would remain unsolved and the future of the country continue in doubt.

By a "vein," as a geological or mining term in general, is understood an aggregation of mineral matter of indefinite length and depth, and of comparatively slight thickness, standing at angles to the line of the horizon, varying in all degrees up to a right or perpendicular angle, in the upheaved masses of the mountains, and differing in character from, and posterior in formation to, the rocks which enclose it.

Gold might be found within six inches of utterly barren sand and silt, or the barren spot might be worked in vain while the metal lay within a half foot of the disappointed miner.

All was different in the mountain prospecting. If the lodes were there, the experienced miners knew where and how to look for them, and with some approach to certainty. But in placer work he was but little better circumstanced than the novice. As finding and following the veins is the true mining, so would finding the veins in the mountain districts be the true discoveries of gold in this region—finding it at home, in its natural, original abiding place where it had remained through all the ages since the earth was young.

So, matters were going along in the fashion we have herein outlined, through that spring of 1859, many hunting and few finding the coveted metal, until May set in.

Larimer street eastward from Cherry creek, spring of 1859.
(One of the Richardson sketches.)

Therefore, finding gold in the bars, and in the beds of the streams, was not a true gold discovery; that had to be made in the mountains by locating the veins from which the vagrant metal of the streams had originated, and whence it was washed down by torrential rains, along with the meager soil, and the detritus of the decomposing veins and rocks, from the slopes of the gulches.

In placer mining everything was worse than uncertain. Workings in a bar yielding fair returns one day would be exhausted at a moment's notice the next morning. There was nothing to guide the prospector in the streams; no suggestions, no indications, for the gold was deposited here and there, as it came down from the mountains, by the whims and accidents of the eddies and currents. All the prospector could do was to laboriously search for it, and even that was often nullified by the caprices of the merest chance, unless everything and every place were carefully dug over and tested.

There was, and still is, a great deal of mica, or silica, scale in the Clear creek districts, as elsewhere, and it is related that a German from Pennsylvania, not knowing it to be "fool's gold," carefully washed out and secreted a large quantity of it, saying not a word to any one of the great bonanza he had uncovered, or of what he was doing. Upon learning that it was not gold, he quit the country in disgust, going back to his Pennsylvania home without delay. But there was something else beside "fool's gold" to be revealed in the mountains and gulches over there.

Under all these discouraging conditions the future of the "cities" of Auraria and Denver appeared almost as blue as the skies that bent over them. Their populations had received a sudden and tremendous relative increase, but it was mostly a turbulent crowd of men, swearing at the country, at their luck, at themselves for coming here; and concluding by calling for eternal destruction to fall upon them if they continued to be foolish enough to remain in such a region.

In the first days of May it became known that George A. Jackson, the experienced miner who, as we have stated, was one of the pioneer prospectors in this part of the country late in the autumn of 1858, and who had remained steadfastly at his work, had disclosed to a party of men, most of whom were from Chicago, a discovery he had made alone in the previous January, and which he had until this time kept to himself. The place was on one of the small tributaries of Clear creek, which Jackson had prospected in the previous winter until he made the discovery, when he covered up all evidences of his work, and waited for spring to open the way for its further development. The tributary was soon named Chicago creek, and the place Chicago Bar, or "Jackson's Diggings;" and Jackson's Diggings immediately revealed great riches.

In the meantime, a party headed by John H. Gregory, a Georgian, who had worked in the gold-fields of that State, made another mountain discovery, on May 6th, not far distant from that of Jackson, but on the North Fork of Clear creek; a high mountain ridge lying between them. It proved to be the richest lode ever found in Colorado, and one of the richest ever known in the world.

No wild-fire of the plains that figured in any of the old stories of prairie conflagrations under the impelling influence of sweeping gales, could have spread faster than did the news of these discoveries, after they had been disclosed. Denver and Auraria were electrified, and depression gave way to unbounded enthusiasm at Cherry creek.

CHAPTER XXVII.

Details of Discoveries by Gregory and Jackson—Gregory's History and that of His Discovery—George A. Jackson—Particulars of His Discovery—Rough Conditions of Pioneer Mining in the Mountains—Jackson's Subsequent Career and Death—No Memorial to Either Discoverer.

After all the disappointing waiting; all the running to and fro—the seemingly wasted efforts that justified the discontent of those who had imagined gold was to be gathered up like pebbles; after its fitful, tantalizing revelations here and there; the lifting up of hopes only to cast them down again; it was found at last, in measures which, if they did not equal the anticipations of the more ignorantly sanguine few, brought joy to the hearts of those who had patiently nursed their faith through the tedious months that had passed, and also set the eager mob wild with enthusiasm.

Tidings of Gregory's discoveries and of those of Jackson made their way along the routes of travel from the east, and in spite of the confusion caused by the stampeders, arrested part of the backward flow and the inclination to join it, to a considerable extent. Though these reports were denounced as new lies by many of those who were then leaving the country, and who knew nothing for or against them, they influenced others who were hesitating between going ahead and turning back, to keep on as they had started. The discoveries came at a most opportune moment, for the dismayed stampeders, had not been the only ones disturbed by the practically resultless efforts of the previous twelve months.

In a "History of Clear Creek and Boulder Valley," published in 1880, Gregory is described as "a lazy fellow from Gordon county, Georgia." The chances are that he was not a lazy fellow, because the occupation he engaged in here did not harmonize with anything but hard labor. Beyond the fact, as stated above, that he was from Gordon county, Georgia, little is known about him. The full story of his life and experiences would make a romance.

He left his Georgia home in 1858, intending to go to the then newly-discovered gold-diggings on the Fraser river of the Pacific slope, in what is now British Columbia, and some four thousand miles distant from his starting point. He made his way westward slowly, and in the summer was at Leavenworth, Kansas. After remaining there a short time he engaged as a teamster to drive a government team from Fort Leavenworth across the plains to Fort Laramie. In that capacity he reached Fort Laramie in the autumn of 1858 where he remained until the close of that year. He told Horace Greeley that he was "detained" there and prevented by circumstances from carrying out his expectation of proceeding from Laramie to his Fraser river destination.

His poverty was the cause of his detention at Laramie. He was unable to find opportunity to continue his westward journey in some such capacity as that which had taken him across the plains, and likewise unable to proceed on his own account. So he remained at Laramie doing such odd bits of work that he could find.

While thus employed he heard the rumors of gold discoveries at Pike's Peak, and determined to come hither. Some accounts have associated him with the Russell party from Georgia, but the reader will presently have learned that up to the spring of 1859 he had no connection with any other prospectors then in the Denver region. He related that he left Fort Laramie immediately after New Year's day, 1859, for, as he expressed it, "a prospecting tour on the east slope of the Rocky Mountains." That date would seem not to have given him time enough to travel the distances he covered, and to do prospecting on the way after getting well into Colorado, nor does the statement he made to Horace Greeley, appearing in a succeeding chapter, account for all his movements.

That winter, as we have previously remarked, was one of extreme mildness, except in the mountain districts, and very favorable to out-door operations. Gregory appears to have set out alone, for he never mentioned having had any associates at that time, nor was anyone known or heard of who claimed to have been with him. Following the story as he often told it, he began prospecting the creeks and gulches after passing the Cache-a-la-Poudre. In February he found himself up in the mountains, on Clear creek, and at that time discovered some gold on the North Fork of that creek about seven miles above its junction with the other fork and on the site of the present town of Black Hawk. This prospect not being satisfactory, he left the creek and started up a gulch which opened there. Where a little ravine came into the gulch he again began prospecting and again found some gold. He was almost upon the lode the discovery of which a few months later, made him fame and fortune, for the small ravine is situated just a little distance southeast of the main lode's outcropping. He found small quantities of gold in other places in that ravine, but a violent snowstorm setting in, during which he came near perishing, he was forced to abandon his search and leave his discovery to be taken up later. He was about out of provisions, and about out of means of getting a fresh supply.

Gregory went back down Clear creek to the "town" of Arapahoe which, as elsewhere mentioned, had been projected by S. S. Curtis about Christmas time in 1858, a short distance east of the site of the later-founded town of Golden. At Arapahoe he became acquainted with Mr. David K. Wall, now and for so many years an honored citizen of Denver, to whom he related the circumstances of his experience on Clear creek, and also his need for assistance in making further search.

Wall had been a California miner and ranchman from 1850 to the fall of 1854, and had come to Colorado very early in the spring of 1859 from South Bend, Indiana, with a small party from that town which went into camp at Arapahoe. In Wall's party were two brothers named Defrees, and another man named William Ziegler. Associated with these were William Fouts, from Missouri, and another, named Kendall, from Iowa. Gregory had been at Arapahoe several weeks, and in the meantime these and many other new people had arrived there from the east and had stopped to "look around." Mr. Wall, becoming interested in Gregory's account, and being impressed with the man's despondent earnestness, agreed to supply him with provisions for a new expedition to the headwaters of Clear creek. Gregory then related his Clear creek experiences to the Defrees brothers, Ziegler, Fouts, and Kendall, and they at once agreed to join him in a second expedition to the gulch. Of his encounter with Gregory at Arapahoe, which occurred soon after the arrival of the party from South Bend, Mr. Wall says:

"John Gregory heard of my being an old Californian, and came to see me. In our conversation he told me that he had been in the mountains and had found light prospects in which was some fine gold, in the little creek at the foot of what is now known as Black Hawk mountain, but not in sufficient quantity to induce him to think that it would pay for the toil of looking further. From his report I was induced to believe that it would be expedient and perhaps pay to have him return and make a new search, but he was rather despondent and refused to go, giving as the most important reason that he was out of provisions and that he had been living on venison for ten days. I told him that my commissary was at a low ebb and more precious than gold, but in this case I would supply his needs in that respect if he would return and take the South Bend boys with him and make a new search, which he finally concluded to do; more, perhaps, for the opportunity of filling his stomach than faith. The result of it was that one of the best, if not the best, gold leads that was ever discovered was done by the western eloquence that I gave him, and resulted in the early development of the mines of our great State. It was found by prospecting with a pan, and that from 50 cents to $5 to the pan could be washed out of the decomposed quartz, clay and gravel, right from the top."

The party set out on foot from Arapahoe about the first of May, going up Clear creek and up its north fork, without serious difficulty, though they encountered some bedded snow-drifts which still lay in sheltered places and through which they had to flounder, until they reached the scene of Gregory's winter operations. They arrived there on the 6th of May, and after making camp, at once began looking for gold. After a little preliminary prospecting in the larger gulch, they went up the smaller one in which Gregory soon settled upon a spot where he thought it would be well to dig and look for float gold. While the others dug he stood looking on and giving unimportant directions. A fair prospect was soon obtained and the diggers were encouraged to go on with their excavating.

Finally Gregory said to Wilkes Defrees: "Bring your shovel and come with me." They went about three hundred feet farther up the side of the gulch where Gregory, indicating a point on the ground, said: "Here's a good-looking spot; stick your shovel in there, Wilk." Defrees did so, overturning a few shovelfuls of earth. "Give me some in the pan," said Gregory again, and Defrees filled the pan half full of dirt, which his companion proceeded to wash at a little stream near by, that flowed through the gulch. The product of that half-pan of dirt was four dollars' worth of gold. The pan was filled the next time, its contents carefully washed, and the result was equally rich.

They then extended their investigations which still further revealed the richness of their discovery, and convinced them that they need search no longer. Gregory had found gold in its ancient home. The vein was definitely located and claims immediately staked off, with two for the discoverer.

Poor Gregory's good fortune unnerved him and he behaved like a half-crazy man. Through the night he could not sleep, passing the tedious hours in muttering to himself of what he would do for his family with the great wealth he believed had come to him. The discovery was made on what became claim No. 5 on the Gregory Lode, and after washing out forty more pans of dirt which yielded forty dollars, the men started back to Arapahoe to notify some of their chosen acquaintances, and to make preparations to duly organize a mining district and to immediately work their claims; in the doing of which they lost no time so far as they could control events.

The Gregory party thus took the precaution, before making their discovery public, to admit their friends on what would now be called "the ground floor;" and to organize their district with rules and regulations by which all future operations should be governed. Claims were defined to be fifty by one hundred feet, and there were just enough men in the Gregory party to own the whole lode, divided that way. Gregory, and Dr. Joseph Casto who was elected and acted as Secretary, pencilled a few rules for the district, and for the time being the thing was done. Dr. Casto was an Iowa man and one of the favored, "ground-floor," friends.

Primitive conditions in Clear creek canon.

A heavy snow-storm intervened and prevented active operations on the discovery lode for ten days. Gregory started a sluice on the morning of May 16th, and by the evening of the 23d, employing five men, had taken out nine hundred and seventy-two dollars' worth of gold. His two claims were Numbers Five and Six. After working them about two weeks, he sold them to two other miners, Henderson and Gridley, for twenty-one thousand dollars. The deal was altogether a credit one, as the purchasers were to pay over the money at the rate of five hundred dollars a week, as they took the metal from the earth. They appear not to have had any capital of their own, as Gregory had to loan them two hundred dollars with which to commence mining operations.

Their first day's labor, with one sluice, was rewarded with six hundred and seven dollars. During that summer they took out seventeen thousand dollars, beside accumulating a large pile of quartz, sluice headings and tailings, which they afterward sold for seven thousand dollars, making the total yield to them from the two claims for that summer's work, twenty-four thousand dollars. We will refer elsewhere to the subsequent history and operation of these claims.

Gregory stated in 1859, after he found his lode, that he "prospected almost every valley from the Poudre to Pike's Peak;" yet there are no details, either from himself or others, of his operations to the southward of Clear creek. That is, if he did so, nothing is known of when and where he went or of what he accomplished or failed to accomplish. He certainly did not have time to work down toward Pike's Peak.

In June Gregory was engaged in prospecting for other parties, and claimed he was receiving "about two hundred dollars a day" for his services. He is credited by the old Colorado Gazetteer with having located the celebrated Bates lode while thus employed by Bates and Tascher; but there is no more definite record that he did so. When he sold his discovery claims he believed he could easily find others for himself, just as good. In this he appears to have been disappointed, as there is no record that he again figured, on his own account, among the fortunate discoverers in that region which was so quickly overrun by eager men; nor was he again so conspicuous in the swift-moving events of those times.

Gregory left Denver on September 7, 1859, for his old home in Georgia, taking with him $25,000 in gold; having previously sent his wife $5,000.

In the spring of 1860 he came back with a party, and brought a small quartz mill which he and an associate named Reese erected on North Clear creek. It was they who bought Henderson and Gridley's quartz and tailings for seven thousand dollars. Gregory ran his quartz mill several weeks at a profit of two hundred dollars a day, and then sold it for six times its cost. Here he disappears from view and definite chronicle. How long he hung on to his fortune, or how soon he allowed it to get away from him, is unknown. Of him Fossett says "he was an inveterate gambler and finally brought up in Montana, where he died poor, sometime prior to 1865." Another story, one that was current here in Denver a couple of years after his final departure from the Clear creek country, was, that in the winter of 1861-62 he disappeared from a hotel in a town somewhere in Illinois, and was not seen or heard of again by any who knew him.

Fossett's statement would seem the more probable, but whichever is correct, or whatever was his fate, the obscurity only emphasizes the lack of knowledge concerning the personal history of the discoverer of the rich and famous Gregory Lode, which has yielded gold to the value of many millions of dollars.

The circumstances of this great discovery prompted Hollister to say:

> "The discovery of the lode called after himself, by John H. Gregory, would seem to rank among those great events whereby the race at large have profited. That in a section of broken mountains, extending the whole length and one-third the width of the United States, a man en route for a distant country, should have been diverted in the midst of his journey, two hundred miles to the south, should have proceeded directly to the spot—a ravine two or three miles in length—and in it and on its bordering hills have struck the heart of as rich and extensive gold, silver and copper mines as are known in the world, is indeed marvellous."

The circumstances of Jackson's discovery were, in some respects, similar to those attending Gregory's. Both men had been prospecting in this region some time before success rewarded their labors, though, as we have narrated, Jackson had been at it longer than Gregory. Both men persisted in their work in the inclement season, and each made what might be called a preliminary discovery in the mountains in the middle of the winter, and each was compelled to leave his discovery unperfected and await the coming of spring to make further and more conclusive developments. Furthermore, each had his headquarters camp in the same locality, from which, in the spring of 1859, the two companies went forth, each under command of one of the discoverers, to begin actual gold mining in the Pike's Peak country.

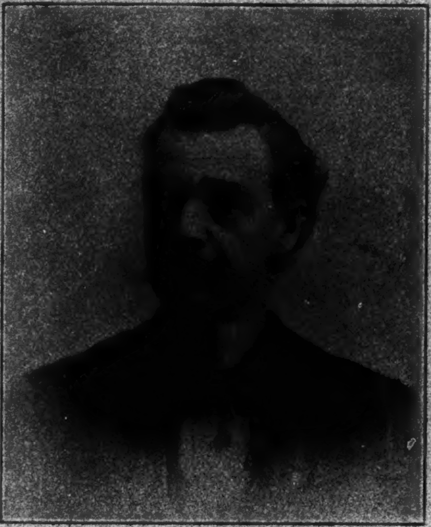
Of Jackson's previous career we have already given some account. He was not a successful miner in California, for the same reason that kept hundreds of men who came to this region in 1859, from becoming successful miners here. He found all the available working places occupied by men who had preceded him, and in the lottery of new locations, chance did not favor him with a paying claim. His California experience, which served him well here, was acquired as an employee of more fortunate miners there. Jackson was a more methodical man than the usual run of his contemporaries here, and kept a diary of his operations in that winter of 1858-59, which is now of greater value and importance than the average diary can ever hope to be. Because of this thoughtfulness on his part, the circumstantial details of his midwinter journey up Clear creek, and of his discovery on one of that stream's little tributaries, may be definitely related. Five years ago the State Historical and Natural History Society procured an authenticated copy of Jackson's diary—a document of great historical value, from which we copy several of the discoverer's entries covering the period of his memorable journey into the mountains.

As stated heretofore, Jackson and his associates, Golden and Sanders, had established their winter camp on the site of the present town of Golden late in the autumn of 1858, intending to prospect from it as circumstances and the weather permitted, and which they did. As December drew to its close they decided that the more distant mountain districts should be the next objectives of their attentions, and they arranged to set out on an expedition to them.

At this point in the narrative Sanders drops out, and is replaced by an individual named or called "Black Hawk," whose identity is not so clearly established as we would prefer to have it. Mr. R. C. Bonney, in an interesting article published in the Denver Times, September 9, 1808, refers to him as "the Indian Chief;" while General Frank Hall, in his "History of Colorado," mentions him as "a comrade who bore the aboriginal sobriquet of Black Hawk." Whether "Black Hawk" were Sanders under a frontier nick-name is not known. Within a few months after these events a white man known only as "Black Hawk" appeared in Denver and was subsequently hanged near the city for complicity in the work of a great organization of horse-thieves operating throughout the central west, and of whose taking-off we will later give some particulars. Several of our pioneers believe it more than probable that this "Black Hawk" was the man who went with Jackson and Golden when they left their headquarters camp for the mountains in the Clear creek region. The mining town of Black Hawk did not derive its name from the "Black Hawk" of Jackson's party, but was so named by the Lee brothers, miners in 1859, (who came from Rock Island, Illinois,) in memory of the noted chieftain of the Sac and Fox tribes of Illinois Indians.

Having made what would seem to have been rather scant preparations for such an undertaking, Jackson, Golden and "Black Hawk" started on their journey near the close of December. They entered the mountains through Mt. Vernon canon and passed into what later became known as Bergen Park. Here, on the second day of their journey, they came upon a great herd of elk which they estimated to include six hundred animals. They camped there, near Bear creek, and Golden and "Black Hawk," excited by the appearance of so much game, and considering hunting elk to be a more attractive pursuit than hunting gold, now concluded to abandon the original purpose of their expedition. They had followed the elk up to the elevation which later was named Jackson's Hill, where they overlooked the frozen reaches of Clear creek, the animals having taken off in another direction.

Jackson determined to do what he had set out to do, and the next day, January 1, 1859, started off alone, leaving his comrades to hunt the elk, and all agreeing to meet at their headquarters camp a week later. Jackson made his way down to the Clear creek level with great difficulty, the snow being from two to three feet deep most of the way, which is rough enough to make hard traveling in midsummer. Reaching the creek he went upon the frozen surface to Grass valley, where, as he afterward related these particulars, he was startled by seeing what seemed to be smoke ascending from a gulch which opened upon Clear creek. Fearing that he was on the point of stumbling into a camp of Ute Indians who would most likely bring his career to a sudden end, Jackson slowly climbed the steep hill that lay between him and the apparent source of the supposed smoke. The snow was as deep there as it was on his path descending to Clear creek, but he waded through it, and when he reached the top cautiously drew near to the other side, where he discovered the smoke-like mist which had caused him uneasiness, to be vapor coming from hot springs down below—the mineral springs of Idaho Springs. While it is probable that hunters and trappers of the fur-trading days had been there before him, Jackson was in one sense their discoverer.



George A. Jackson.
(Photographed about 1880.)

He went ahead, descending the mountain, which we now know as Soda Hill, and making camp at the springs. Here were assembled large flocks of mountain sheep, one of which he immediately added to his camp supplies. He remained there the ensuing four days and prospected the vicinity, but found nothing to encourage him to stay. On the morning of the 5th he moved his camp to what later became known as Chicago creek, on the bank of which he established himself, and where he soon thought he saw favorable prospects for finding gold. There, on January 7th, on the left bank of that creek, about three hundred feet above the line of its mouth, he made his noted and momentous discovery. The extracts from his diary, which follow here, tell in his own concise, forceful language, of these happenings after his separation from Golden and Black Hawk on the morning of the 1st of January.

"January 1, 1859—Clear day; my supply of 'states grub' short—two pounds bread, half pound coffee, half pound salt, plenty of meat for myself and dogs. So here goes for head of creek. Told Tom [Golden] I would be back in a week to our old camp above Table mountain. Off; good traveling most of the way; killed mountain lion to-day and camped at mineral springs near mouth of small creek coming in from the south. Snow all gone around the springs. Killed fat sheep and camped under cottonwood trees. One thousand sheep in sight, to-night; no scarcity of meat in future for myself and dogs."

The first part of this entry appears to have been made when he was about to leave camp in the morning, and the concluding portion after he had gone into camp in the evening. He had two dogs with him for company, and the subsequent misfortune of one of them in a fight with a wild animal caused the explorer a couple of days' delay in getting back to his headquarters camp on the site of Golden, which was the one meant by the reference to "our old camp above Table mountain."

"January 2—'Drum' and 'Kit' woke me by low growls at daylight; sheep all gone; mountain lion within twenty steps; pulled gun from under blanket and shot too quick; broke his shoulder, but followed up and killed him. Clear, high wind, and very cold. In camp all day; built bough house, and ate fat sheep all day; bread all gone; plenty fat meat; 'no wantum bread.'"

The reader may form an estimate of the intrepid character of the man by the foregoing entries. Starting with an inadequate supply of provisions, alone excepting for the companionship of his dogs, the "sheep all gone," mountain lions hanging around his camp, his situation does not seem to have been an inviting one there in the mountains in midwinter, a high wind blowing, and the weather "very cold."

"January 3—Still clear and cold. Sheep came down again; are very tame; walk up to within one hundred yards of camp and stand and stamp at me and the dogs; mountain lion killed one within 300 yards of camp to-day, and scattered the whole band again; went up the main creek to another tributary coming in from the south, a little larger than this one."

He had made camp on the day of his arrival, on Soda creek, and the other tributary of "the main creek" to which he here refers, was Chicago creek, on which four days later he first found gold.

"January 4—Pleasant day; made a long tramp to-day; followed up the main fork [Clear Creek] five miles; here the main creek forks; each one about the same width; followed up the north fork about three miles; canons and plenty of snow; got back to camp after dark; mountain lion stole all my meat to-day in camp; no supply to-night; d—m him."

Jackson's philosophical indifference for things he could not get did not cover theft of what he had. His bread supply having given out the day after his arrival at Soda creek, he concluded that he did not want any bread; but to have a mountain lion steal all his meat was quite a different matter. He and his dogs went to sleep cold and hungry that night but it does not appear to have in the least impaired his cheerfulness. His "long tramp" that day had taken him up to the mouth of Fall river, and it was up that stream he went three miles farther through "canons and plenty of snow," the round trip covering about sixteen miles, and ending in a supperless night in a "bough-house."

"January 5—Up before day; killed a fat sheep and wounded a mountain lion before sunrise; ate ribs for breakfast; drank last of my coffee; after breakfast moved up half mile to next creek on south side; made new camp under big fir tree; good gravel here; looks like it carries gold; wind has blown snow off the rim, but gravel is hard frozen; panned out two cups; no gold in either."

If early to bed and early to rise did not make Jackson healthy, wealthy and wise, he appears to have been benefited, at least. The early rising and the friendliness of the mountain sheep restocked his ravaged larder, and in moving his camp, his judgment, or chance, or fate, or the fortune which is alleged to sometimes favor the brave, led him to within a few feet of a rich deposit of gold.

"January 6—Pleasant day; built big fire on rim-rock to thaw the gravel; kept it up all day; carcajou [glutton] came into the camp while I was at fire; dogs killed him after I broke his back with belt-axe; h—l of a fight."

The faith and courage of this lone man there in that mountain wilderness, in the rigors of mid-winter, slowly thawing the deep-frozen gravel in search of that which if found, would surely bring a hundred fold more benefits to others than to himself, must command the admiration of every considerate reader who follows this narrative. However, he found his reward next day.

"January 7—Clear day; removed fire embers and dug into rim on bedrock, panned out eight 'treaty cups' of dirt and found nothing but fine colors; ninth cup I got one nugget of coarse gold; feel good to-night; dogs don't. 'Drum' is lame all over; sewed up gash in his leg to-night; carcajou no good for dog."

Beyond all question this was the first true discovery of gold in these Colorado mountains, from a historical point of view. Of its date and of the attendant circumstances there can be no doubt. Jackson's account is clear in details and conclusive in statements. His mountain discovery was the first in this region from which definite mining developments were made, and out of which permanent mining operations grew, and which have been continuous to this day.

"January 8—Pleasant day. Well, Tom, old boy, I've got the diggings at last, but can't be back in a week; dogs can't travel; d—m a carcajou. Dug and panned to-day until my belt-knife was worn out, so I will have to quit, or use my skinning knife. I have about a half-ounce of gold, so will quit and try and get back in the spring."

Jackson did not set out to do anything more than locate gold at or near some place where nature had brought it to the surface and where it had remained sealed in the original vein formations. It is true that this gold he took from the thawed-out gravel had come from disintegrated vein-matter and had been deposited there by the action of the elements, just as the vagrant metal had been deposited in the bed of Cherry creek, miles from its mountain home, and that the gold in that bed of frozen gravel was "placer gold;" yet Jackson's California experience and his well-trained judgment told him what its presence there in that mountainous district meant. This is clearly indicated by the positive confidence with which he declares "I've got the diggings at last," and is further confirmed by the developments which immediately followed active work right around his gravel bed, and which has not ceased from that time to this. He had no mining tools with him—neither pick, nor shovel, nor pan. He used his belt-knife instead of pick and shovel, and the "treaty cup" that did duty as a pan was an iron drinking-cup holding a little more than a pint, and such as the government furnished the Indians along with other supplies given those troublesome wards of the Nation; hence its name. Jackson continues his account—

"January 9—Filled up the hole with charcoal from the big fire and built a fire over it; marked the big fir tree with belt-axe and knife; cut the top off a small lodge-pole pine on a line from fir tree to hole, 76 steps from big tree in a westerly direction; all fixed now; will be off down the creek to-morrow."

This careful obliteration of evidence of his work, and the marking of trees in a way that would be unmistakable to himself but not significant to a chance visitor to the place, indicate that Jackson appreciated the value and importance of his discovery. There is, furthermore, something in the definite entries in his diary, respecting these matters, that suggests guarding against his discovery being lost should misfortune resulting in death overtake him before he rejoined his associates, at their headquarters camp.

"January 10—Storming like h—l; high wind and cold; in camp all day; 'Drum' can hardly walk around to-day."

"January 11—Cold; not snowing; still in camp doctoring my dog to-day. His leg is swollen until it is as large as my arm above my elbow; carcajou no good."

"January 12—Made a start down creek to-day on ice; traveled about five miles and camped; got balsam and put on 'Drum's' wounds to-night. He is very sore."

Thawing the frozen bed of gravel was a slow bit of work, and collecting the fuel of logs and branches from the down timber was a hard one. Jackson got only nine dollars' worth of gold from the dirt he thawed, and picked out with his knife, and washed in his "treaty cup," but under such conditions and with such tools, it is surprising that he recovered anything. The balsam appears to have put 'Drum' in condition for travel, and Jackson proceeded on his return without further delay. When he reached the headquarters camp where Golden town now stands, after an absence of two weeks, he found that "Black Hawk" and Golden had returned there more than a week before.

Recent view of locality of Jackson's discovery.
(White x in middle distance indicates the place.)

Jackson immediately told Golden of his discovery, and the two agreed to keep the matter to themselves for the present, which they did for a short time. Among those who arrived early that spring at Arapahoe was a party of men called the "Chicago company," because most of its men had come from Chicago. These men, becoming acquainted with Jackson, and learning that he had been a miner in California, and that he had been prospecting in this region since the previous summer, proposed to him to join them as their associate, guide and counsellor on a prospecting expedition into the mountains, and agreeing to furnish him with all provisions, supplies and essentials, from their common stock. Jackson accepted the offer, and the Chicago men began preparations for their expedition, without knowing anything of their new associate's secret. Jackson suggested to Golden that the party be told of the January discovery, but Golden objected, and when Jackson insisted, a quarrel between the two ensued which resulted in their permanent separation, and from which time Golden disappeared as a figure in the enterprise.

The Chicago party with Jackson and a few others who had been added to it, making a total of twenty-three men, started up Clear creek into the mountains on March 7th, Jackson withholding information of his previous discovery until the expedition was fairly under way, and until he had satisfied himself of the character of the men. They had a good outfit which, with the wagons to hold it and the teams to pull them, made a little caravan; and progress into the rough, untracked, mountain wilderness with loaded wagons, was exceedingly hard and slow. The bed of the stream was choked with ice and the gulches still laden with accumulated snow. These pioneers had to literally hew a way for their wagons, and in some places even that could not be done. So they unloaded their wagons, took them apart, carried loads and wagon-parts on their backs over the otherwise impassable places, put their wagons together, reloaded them, and went on, cutting and prying out a way for them until they encountered the next tedious and laborious portage.

In consequence of these hard and trying conditions it was about the middle of April before they reached the creek where Jackson had thawed the gravel and found the gold, and which, from the party name of the company, was named Chicago creek. The exact date of the party's arrival there has not been preserved, but on April 17th, the men formally held a meeting, organized the first mining district in these Colorado mountains, and adopted regulations for it; the documents in possession of the State Historical Society showing these transactions to have occurred on that date.

Jackson's discovery proved to be a rich one. He and his party went to work at once after they had established their camp. Having no lumber, they knocked the box-beds of their wagons apart, and with the boards thus obtained contrived some makeshift sluices which temporarily answered the purpose, and recovered gold in surprising quantities. In the next seven days they took out nearly nineteen hundred dollars' worth.

Jackson came down to Cherry creek, as this locality was then still commonly called, bringing this gold-dust with him. He then took Henry Allen into his confidence, and to him delivered this first installment of dust, directing that it be used for the business-like purpose of buying the supplies of those immigrants who were preparing to leave the country and go back home, after their brief but most outrageously unsatisfactory sojourn. Allen began purchasing supplies and paying for them with virgin dust. These transactions instantly made it apparent that a rich discovery had somewhere been made, and Jackson's association with Allen soon marked him as the responsible man. He was watched and followed wherever he went, and besought to make a clean breast of the affair and tell all he knew, which he soon did.

Gregory had also kept quiet about his discovery for a few days and until he and his friends had made prudent provisions for themselves. Information of both discoveries became generally known about the same time, though some knowledge of Jackson's was in circulation a few days before the news of Gregory's came as a thrilling addition to it. Then followed the headlong stampede for Clear creek, and real estate in Auraria and Denver rose in value by leaps and bounds a hundred per cent at a jump.

The "big fir tree" which Jackson blazed as one of the marks of his discovery location, afterward succumbed to the timber demands of mining, but its stump still remains to mark the place where it stood.

It is stated in some accounts by earlier writers that Jackson after his return to Arapahoe from his discovery expedition, fell in with Gregory who had also recently returned from the Clear creek mountain region; and that just before the Chicago company left Arapahoe, told him of the discovery and invited him to either join the party then, or to come to Chicago creek as soon as he could, and take up a claim; and that Gregory, in later attempting to do this, became confused as to the directions given him by Jackson, and went up the north fork of Clear creek which, by this accident, led him to his own rich and famous discovery.

Inasmuch as Gregory had, at that time, an unperfected discovery of his own and which was in about the same stage of development as Jackson's, though it had not in the preliminary investigations yielded nine dollars' worth of gold, the statement that the discovery of his lode was due to this accidental divergence, does not harmonize with the facts, as related by himself and confirmed by the reminiscences of David K. Wall. Gregory appears to have led his party directly to his gulch, the richness of which was immediately revealed. Furthermore, in the account of his movements leading up to his discovery, which he gave Horace Greeley, and which appears in a subsequent chapter, he did not mention Jackson nor did he intimate that he knew anything about him or what he had done. Gregory's narrative represents his discovery as having been a wholly independent one, and made without knowledge of the operations of Jackson or anyone else, save those who were with him in the expedition which resulted so fortunately on that 6th of May.

Jackson's midwinter privations and hardships, and the laborious toil of his later associates in traversing the comparatively short distance from Arapahoe to the creek on which he had made his discovery, indicate far better than words can tell, the real character of many features of pioneer mining, and may serve to demonstrate the wide difference between the visionary anticipations of the great multitude of ignorant, inexperienced men who came here that spring, and the true character of the work before them if they succeeded in finding any gold. Such work as Jackson and his associates did before the mines on Chicago creek were fairly developed, did not figure in the calculations of a very large majority of those who streamed into this region afterward, with almost every sort of conceptions of what they would have to do, except the true ones.

Although Jackson put in nearly the half of a year in most laborious and persistent prospecting, he did not long engage in mining where he had found what he so long had sought. In a few weeks he sold his discovery claims to the Chicago party, but for what amount is not known, and went back to Golden where, in the meantime, Tom Golden, his former associate, in company with others had located and surveyed that town. Jackson identified himself with the young metropolis and remained there until the spring of 1860, when the discoveries in California Gulch attracted him thither. It may be remarked here that the redevelopment of the riches of California Gulch sixteen years later called into existence the large and prosperous city of Leadville. Jackson remained in that district until the spring of 1861 when he returned to his old home at Glasgow, Missouri. Being in sympathy with the southern cause, he entered the Confederate army as Captain of a company of sharpshooters recruited in the southwest, and served through that great and prolonged struggle, under Generals Jackson, Shelby and Bankhead, attaining the rank of Lieutenant-Colonel. But he became popularly known in Colorado as Captain Jackson.

Several years after the war Jackson returned to Colorado and again became interested in mining. Of some additional particulars of his life, and of the circumstances of his death, his son-in-law, Mr. Mark Wm. Atkins, of Ouray, supplied us with the following information:

"He settled in Ouray county in 1888, and built a fine residence about five miles below the city of Ouray, although he had mined in the county before that time and hunted buffalo on the spot where Ridgway now stands. He followed mining, and at the time of his accidental death was a promoter of and an owner in a number of mines. His wife was Miss Belle Hendricks, formerly of Kentucky, but afterward of Bonham, Texas. A daughter was born to them, the only child, who is the writer's wife. Captain Jackson was born at Glasgow, Missouri, July 24, 1832, and died March 13, 1897. The cause of his death was a gun-shot wound inflicted by himself in carelessly drawing a double-barrelled shot gun from the rear of a box-sled while on his way from the Blue Mountains, Utah, to Mancos, Colorado. Mrs. Jackson died at her parents' residence in Bonham, just nine months after Captain Jackson's death, and they are buried side by side in the cemetery near that city."

Of his first coming to the west and of his sojourn in it, Captain Jackson's daughter, Mrs. Mark William Atkins (Nina Jackson), informed us as follows:

"When my father left Missouri he was but sixteen years of age—just a mere lad. He joined a party headed by Kit Carson (who was a cousin), who was on his way to California during the first gold excitement.

My father visited his old home but a few times afterward. He had the gold fever, so to speak, and was only content among the mountains he had learned to love so well. His life from that time on was spent in the west."

Jackson was an honored guest of the city of Denver in 1895, upon the occasion of the first Festival of the Mountains and Plains. At that time, with a party from Denver, he visited the locality of his discovery and pointed out the spot where he thawed the gravel and found gold in that midwinter of 1858-59.

In the autumn of 1898 there was inaugurated a movement at Idaho Springs to mark the spot where Jackson made his discovery, with an appropriate monument that would commemorate the historic event, and incidentally the historic personage identified with it. Title to the bit of real estate necessary to this most praiseworthy purpose was obtained and vested in a trustee, and the beginning made for permanently and unmistakably fixing an enduring record, as to time and place, of this first discovery of gold in the Colorado mountains.

But to the personal memory of either Jackson or Gregory, not even the beginning of provision for monument, statue, or testimonial of any kind to the great services they rendered, has been made. It is true that they did not pick up the first gold found in the Denver region, but they did make, here in these mountains, the first true discoveries of gold, from a correct historical point of view, in what is now Colorado. It is also probable that if they had not made their hard-won, vital discoveries, out of which this great city grew, others would have made them later; but such a presumption does not impair the fact that they did make them, nor cloud their title to all the credit for having done so—a distinction to which they are as justly entitled as Columbus was for that of having found America centuries after the Norsemen had crossed the North Atlantic and landed on its western shores.

CHAPTER XXVIII.

Race to the New Diggings—Swarming Miners—Conditions in Mining Camps—Weary and Disappointed Prospectors—Cheap Provisions and Other Supplies—Mining Progress—Miners' Bill-of-Fare—W. Green Russell's Discovery—Attempted Revision of Gregory District Mining Rules—Election of District Officers—Experience of Two Discoverers—Gunnell Lode—Yields of Mountain Mines—First Mining Regulations—General Developments in Clear Creek Region—"Luck" in Mining.

Immediately after these rich discoveries in the mountains became publicly known, there was a pell-mell race made for the headwaters of Clear creek, and Denver and Auraria were well-nigh depopulated. Within a month thirty thousand people were scattered over that region. In they went, headlong and with a "hooray, boys!" each striving to be ahead of the others, and all confident that their fortunes were as good as made. In the immediate vicinity of the discovery claims there was not working room for one in fifty of those who rushed in there, and the great mass of anxious men had to disperse through the gulches, along the streams, and over the ranges roundabout. Many paying claims were speedily located, but hundreds of the great throng never found a trace of gold in all their weary wanderings. The experiences of that summer strikingly illustrated the uncertainties of mining, or of trying to find a place to mine. Some were working claims of astonishing richness; many others were in the depths of despair because of their utter failure to find anything.

On the first of May, 1859, the Clear creek country was a wilderness in practically undisturbed possession of the wild animals of the ranges, and they had viewed with wondering curiosity the two pioneer parties of gold-hunters following the streams to near their sources. It was, also, a debatable and fighting section for the Utes and Arapahoes, but neither had attempted to occupy it long at a time.

The Chicago company had located at the place of Jackson's discovery, about the middle of April, but information concerning it did not reach outsiders until that month had closed. Within ten days after Jackson brought down to Denver the first output of gold and, after much solicitation, had told what was going on at Chicago creek, hundreds of men had reached the locality and many other hundreds were toiling up the rough and rocky way to it. On the 6th of May the Gregory discovery was made. On the 16th the enlarged Gregory company, then numbering seventeen men, began systematic work on their claims, having up to that time, succeeded in keeping news of the rich diggings from becoming public. But on the third day thereafter, came the advance columns, aggregating a hundred or more men almost in a body, of the eager multitude which had finally heard of what had happened up there. Within a month the narrow Gregory Gulch from North Clear creek to the confluence of Eureka, Nevada, and Spring Gulches, was swarming with people, and that confined valley, alone, harbored a population of about five thousand.

In this entire aggregation of humanity there were but twelve women; five were the white wives of miners, and the other seven were Indian squaws living with white men in the capacity of wives. This, however, caused little comment, as social ethics were subordinated to what were considered more practical and important topics. The miners lived in tents, rude cabins hastily piled together, bough houses, in their wagons, or in any other shelter that came handy; all crowded into the gulch as closely as they could be. There was scarcely a table or chair in the camp. Any place and any thing would do for the present in that feverish existence.

One of the most disagreeable features of this rough life in the mining camps was the untidiness, the uncleanliness, that so soon became conspicuous. In numbers the miners equaled a small army, and like an army, the cooking, washing and other camp work was done by men. But unlike an army, there was no system, no rules, no discipline, to enforce comparative cleanliness. The camp work was done hurriedly, carelessly, and in the easier way, with the result of extreme untidiness; if so mild a term can be construed to represent the actual conditions. Men became utterly indifferent to their personal appearance, and altogether such an aggregation of unwholesome aspects as those present in Gregory Gulch in July, 1859, is not often put forward. Fortunately, the pure dry air of the mountains was instrumental in correcting much of the abuses committed by the heedless multitude, which, in any other part of the world, would have brought a pestilence among people circumstanced as they were. But the camps as well as the two towns at Cherry creek, were remarkably free from disease, and the health of the people, considering all the conditions and the careless modes of life practiced, was extraordinarily good; and deaths were, in a proportionate sense, very few.

In the two towns here at the mouth of Cherry creek in June and July, the excitement and bustle kept the citizens awake and busy day and night. An almost unbroken train of wagons and people was rolling in, and after a brief halt to learn directions to be taken, passing across the river on their way to the diggings. The narrow streets of the towns swarmed with men with thought and speech confined to the one absorbing golden theme.

During those midsummer months of 1859, the excited new-comers streamed through Denver and on over to the mountains at the rate of about five hundred a day; many others reached the diggings by ways that did not bring them past the mouth of Cherry creek. These throngs included a great variety of men. Members of the learned professions were bawling at their ox-teams, with clerks, plainsmen, steamboat-men, former merchants, farmers, mechanics, and bankers keeping them company. There were a great many quite young men, and a good sprinkling of mere boys, in the procession. Among the latter was a boy of sixteen, named Nathan B. Scott, who, after he reached the diggings, was hired by Henderson & Gridley to drive their ox-team that hauled their supplies from Denver to the Gregory claims they had recently bought from the discoverer. Scott now represents the State of West Virginia in the United States Senate.

Most of these pilgrims walked all the way from the Missouri river. Nearly all of them came with teams, but the wagons were usually laden with sufficient stuff of one kind or another to make load enough for the teams to drag behind them day after day, with practically no intermission. So the people had trudged along beside their wagons through the long journey. The rate of progress averaged between twelve and fifteen miles a day, but it frequently happened that the spans were made longer or shorter for the day, as circumstances of the trail suggested. Of the several routes to Denver that by the way of the Arkansas river, though the longer, was found the better and pleasanter for both man and beast.

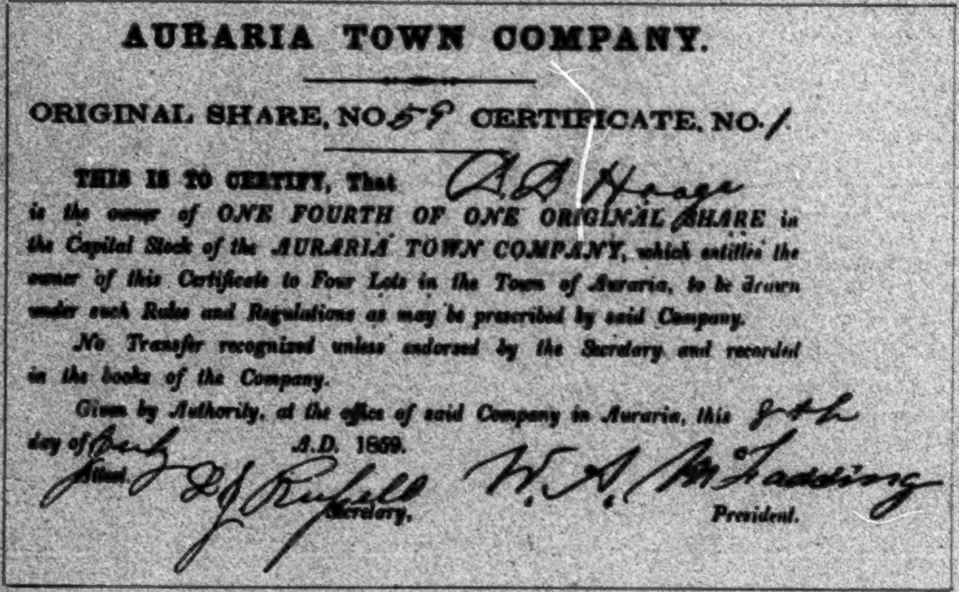
When the wayfarers came into Denver and Auraria, and when gentlemen from the country came down from the mines, they found sundry preparations at hand for driving dullness out of their spare time. Small gamblers and swindlers were entitled to credit for most of this thoughtfulness. They had their petty little schemes and miserable swindling outfits arrayed at the street side or under a friendly cottonwood tree, and with loud voice proclaimed the merits of their methods, the purity of their purposes, and the certainty of great gains to every "gent." having confidence enough in his own ability to make a practical investigation of the propositions spread out before him. It is a strange commentary on human nature that these pestiferous creatures flourished and fattened on the proceeds of their wretched devices for cheating and swindling.

However, the reflux tide early began its outward flow, and a couple of hundred men were daily coming back from the mountains to begin their homeward journey without delay; tired, disappointed, down-hearted, bitterly denouncing the gold country as a humbug and a fraud, and referring to the infatuation which led them out here, with much picturesque profanity. Some had prospected and delved for two or three weeks, worn out their boots, tattered their clothing, soured their dispositions, and found not a thing. So, they were leaving; bewailing their hardships, unmindful of the fact that others had put in nearly a year doing the very kind of work that had worn out these fresh fortune-seekers in a month. For each departure came four recruits for the camps, to go through the same experience for the sake of a possible chance for a more satisfactory result. Many in the camps were working for a dollar a day, and board of the roughest and toughest kind; and were glad of a chance to do it.

While a large portion of these Rocky Mountain pioneers were homeless men without endearing ties behind them or in any other direction, there were hundreds who had left homes and families and other friends in the east. To many of these, in addition to their physical discomforts and privations, came that most distressing malady, homesickness. Not even the novelties of the new and strange life, the charms of the pure air, the panorama of the magnificent region, the oddity and humor of many an incident, the golden reward they were seeking—all these could not compensate for that sinking of the heart, that feeling of abandonment and exile, which would crowd in and for a season deprive hope of its power to sustain the spirit. Because of this, many gave up and made their way back to home and friends with lightened hearts.

During this summer provisions and general supplies were relatively cheap—made so by the hundreds about to set out for the east being willing and anxious to sell their surplus for the best price they could get. Retaining enough to supply their needs until they reached the Missouri river, they converted the remainder into money on the best terms they could make. The consequence was that large quantities of supplies were obtainable at prices nearly the same that had been paid for them at the river by those who offered them for sale. Frequently the prices were less, with no allowance for transportation. This was so at Denver and Auraria as well as in the mining camps, many immigrants arriving late in the summer, concluding to return after reaching here, without going up into the mountain diggings—an undertaking which they gloomily decided would be a waste of time, energy and supplies.

But it was by no means a period of general depression and discontent. There was a very bright side to the picture, and when the brief time that had elapsed since the discoveries was considered, the accomplished results seemed extraordinary. In the first week in June a party of twelve men in the Gregory diggings had cleaned up one thousand dollars' worth of gold at the end of one day's work. Several claims were yielding from one hundred to four hundred and fifty dollars daily, while individual operators were every day adding to their fortunes amounts ranging between twenty-five and one hundred dollars. A number of claims had been sold for good, round sums after their discoverers had worked them but a few days. Hundreds of men were industriously prospecting, while many others who thought they had found what they were looking for, were busy making sluices and shaping up other preparations for active work on their claims.



AURARIA TOWN COMPANY.

ORIGINAL SHARE, NO 59 CERTIFICATE, NO. 1

THIS IS TO CERTIFY, That A. B. Hoage *is the owner of ONE FOURTH OF ONE ORIGINAL SHARE in the Capital Stock of the AURARIA TOWN COMPANY, which entitles the owner of this Certificate to Four Lots in the Town of Auraria, to be drawn under such Rules and Regulations as may be prescribed by said Company.*

No Transfer recognized unless endorsed by the Secretary and recorded in the books of the Company.

Given by Authority, at the office of said Company in Auraria, this 8th *day of* July *A.D.* 1859.

Attest. D. J. Russell *Secretary.* W. A. McFadding *President.*

An Auraria City Town-lot Certificate—size of original.

The staple necessaries in the commissary were whiskey, hot bread, pork, beans, and coffee. The life and labor were exhausting, and the use of stimulants which would have been excessive under other conditions, was not so there. A butcher had established himself at Gregory camp, and the weary thin, belabored oxen, only a few days from their long, toilsome journey across the plains, were being slaughtered, cut up, and sold for food. All the cattle became thin before they reached the mountains, and their opportunities for recuperating had been as meager as their time had been short.

The miner's bill-of-fare, therefore, was not an elaborate one, but an absorbing appetite made up for all the deficiencies of his larder, or those attending his methods of preparing his food. Of his bed and board an observant writer in those times says:

"The miner's life is a hard and laborious one; living in a tent or rude shanty; making up his bed at night with a blanket or two on the ground or on a frame of poles; cooking his meals over a fire in the open air and eating them on a log. His bill of fare consists of pancakes made from flour and water with the addition of a little soda and cream of tartar, a strip or two of fried bacon and a cup of tea or coffee. Sometimes soda bread or a corn cake is made and some dried apples stewed. This is the miner's meal for the day, and notwithstanding its sameness some seem to relish and grow fat on it, always making up in quantity what is lacking in quality. I have seen a company of four men sit down and eat a large loaf of bread, eight slices of bacon, a four-quart basin of apple sauce, besides drinking a quart of coffee each; and then they were hardly satisfied."

At Gregory Gulch, by the first of June, a blacksmith with his forge was making more money than the average miner, by sharpening picks at fifty cents apiece, with charges for other work in proportion. A grocery, with the usual frontier accessories in which was invested the greater part of the capital and which yielded the larger portion of profits, had just settled itself for business. Of the multitude in that wilderness in the second week in June, less than half had been there ten days. Those who had been in three weeks took on airs and prided themselves as early settlers; while the men of the first week's influx, now an event a month old, were venerable and oracular pioneers.

William Green Russell, who had worked the bed of Dry creek, putting into the South Platte a few miles up-stream from Denver, in the summer of 1858, had returned to Georgia, as we have told, and stayed there through the winter of 1858-59. At the close of May, 1859, he came back here, bringing with him a company of one hundred and seventy men. Russell proceeded at once to the Gregory camp and began prospecting in its vicinity. On June 9th he made the third rich discovery in that Clear creek country. It was on a small tributary of North Clear creek, a little south of, but parallel with, the Gregory claims, in a ravine which was given, and still bears, the name of Russell Gulch. The gulch was at once staked off into claims from one end to the other, Russell and his men taking the lion's share, but leaving a few chances for the first-comers of the crowd that immediately rushed in. While this discovery did not prove to be of the permanent value of Gregory's and Jackson's, the gulch yielded a large amount of gold that season and the next. At the outset, six men in one week took out seventy-six ounces of gold worth from sixteen to eighteen dollars an ounce. The place quickly swarmed with busy men.

When the rush to Gregory camp set in pell-mell, comparatively few of those who went there could, as already mentioned, find places in which to work, anywhere near the discovery claims; for which reason much discontent was manifested, and a general re-distribution demanded, with claims reduced in size to twenty-five feet in width. So, within a few weeks a mass meeting was called to change the rules and regulations of the district. Mr. W. N. Byers, who was present, describes the meeting as looking like an alighted flock of birds, so thickly were the sides of the gulch covered with men.

The Gregory contingent was shrewd and quick-witted. Its members controlled the meeting, and elected Wilkes Defrees, one of their number, President, or Chairman. A committee of twelve men, one from each of the different States represented, was proposed, to draft a code of laws that should settle everything and satisfy everybody. The Gregory folks had William Green Russell on their side, and his party of one hundred and seventy men would do about as he said. So, the Gregorys and the Russells scattered through the crowd and nominated their friends for the committee, the meeting approving the selections in every instance. The out-witted new-comers, not knowing how they had been managed by the experienced miners, were surprised and disgusted to find that the committee appointed by themselves to make the revision, reported no material changes in the rules. They had failed to perceive that the pioneers were mingling in the assemblage in every quarter, and nominating all the men for the committee. Not knowing the nominees, the malcontents voted them into service and accepted the report because they had done so, without a suspicion that they had been outwitted.

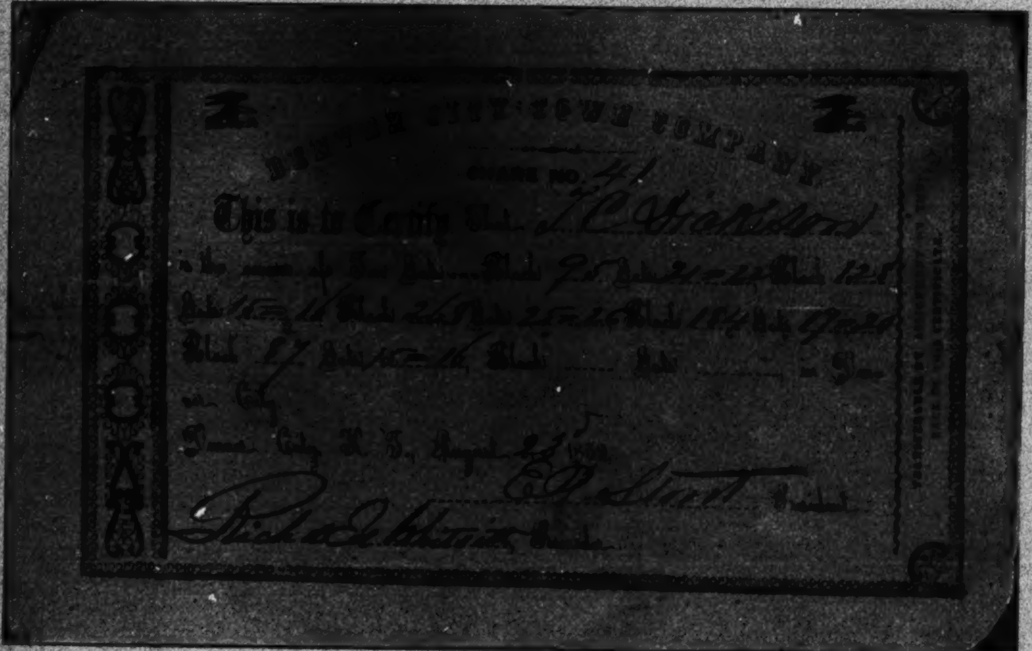
The mining laws adopted were nearly identical with those of California; defining the boundaries of the district; forbidding the taking of more than one claim of a kind, except by purchase, properly attested; fixing the extent of a mountain claim at one hundred feet on the lode and fifty feet in width; and of a gulch or creek, claim at one hundred feet along the gulch, or creek, and extending from bank to bank; limiting the time of holding without working, to ten days; giving the discoverer a "discovery claim" in addition to his working claim, and which he could work or not, as he chose; properly dividing the water of a stream between the miners working on it; and including many less important regulations. Disputes were to be settled by arbitration.

On the 9th of July another meeting was held at which it was resolved to elect by ballot a President of the district, a Recorder of Claims, and a Sheriff. Richard Sopris was chosen President; C. A. Roberts, Recorder; and Charles Peck, Sheriff. A committee was also appointed to codify the laws of the district. This, outside of mere mining camp regulations, was the first organization of local self-government in the Colorado mountains.

An incident of these times, and one showing how some things were sometimes done, was part of the experience of the discoverers of fine diggings in a distant recess of the mountains. A. D. Gambell and a few associates came into the country in May and at once went to the mountains. By dint of the hardest kind of work, they bodily packed their belongings through the rocky wilderness far up on a tributary of Boulder creek, having been compelled to leave their pack-mules behind. Up there in a place which was afterward known as "Gambell's Gulch" and from which much gold was taken, they began prospecting, with the frosty work of the previous winter still around them in abundance.

One June 5th they made a rich discovery, taking eight dollars' worth of gold from the first little batch of dirt. Everything was still frozen, and like Jackson, they had to build a big fire to thaw the dirt, and then get water for washing it by thawing snow. A few days later Gambell made a tin contrivance with which he sifted ninety dollars' worth of dust. This determined them to stay there. Needing some things for use in building a cabin, and some other supplies, Gambell and one of his comrades named Bolinger, came to Denver to get them, and brought that dust along to pay for their purchases. They had not made many trades before they became persons of importance, and men became inquisitive as to where they had found so much dust.

They left Denver after nightfall, walked to Golden, and after crossing Clear creek bivouaced for the night on its bank. They did not know that they had been watched and followed until they awakened next morning and saw several covered wagons on the opposite side. Some men from the wagons went over to them, and told them to recross the creek and get their breakfasts at the wagon camp, and then guide the owners of the wagons to the place where the gold had been found, on pain of being hanged to a tree if they failed to do it. Gambell and Bolinger went with their captors and got their breakfasts; and, as their arbitrary hosts seemed terribly in earnest about the promised hanging, the unwilling guests guided them to "Gambell Gulch," which soon became the scene of much activity.



A Denver City Town-lot Certificate—size of original.

There was little danger that Gambell and his comrade would have swung in mid-air, had they refused all information; but the affair resulted in the development of their gulch several weeks earlier than it otherwise would have been.

Another rich and famous discovery made up there in what is now Gilpin county, was the work of Harry Gunnell, a young man who had been a store clerk in the city of New York, and who came here with the crowd of 1859. The Gunnell lode was exceedingly rich and in a few months its discoverer had a fortune in his possession which he squandered as rapidly as he had acquired it. It was not a rare thing to obtain one hundred dollars' worth of gold from a single pan-ful of dirt, and hundreds of dollars' worth from a single cord of ore. In connection with his account of this discovery, Fossett tells the following story:

"Among the memorable characters connected with this lode in the early days, was a kind, genial gentleman from Wisconsin, named Doe, who, like many others, walked into the country with his pack upon his back. 'Fifty-niners' may remember a sermon he preached on the sabbath after his arrival, on the point of rocks near what is now the heart of Central. Several hundred men gathered to listen to the eloquent speaker who was then called Reverend. His exhortations to his fellow gold-hunters to follow the paths of truth and righteousness, and the vivid pictures he drew of the far-off homes they had left behind them, brought tears to the eyes of many of his hearers. He closed by inviting them to visit his tent that evening to hear another sermon. A number put in an appearance, but somehow the discourse that night proved to be a social game of 'Twenty-one,' and Doe's earnings therefrom enabled him to buy a claim on the newly-found Gunnell, which he mined with great profit. He afterwards gallantly led a Wisconsin regiment in the war of the rebellion, and in course of time, resigned and returned to Colorado to work his mine, which he subsequently sold for $100,000."

Many of the pioneer "mountain diggings" were remarkably rich, yielding results that were astonishing, especially when the crude, imperfect methods and appliances used, were properly considered. Of the out-put of these surface workings in the decomposed quartz of that region in those exciting summer days of 1859, chiefly in the immediate vicinity of the Gregory discovery, Hollister gives these details:

> "At first we find them yielding enormously in a simple sluice. It was not unusual for four or five men to wash out from the Gregory, Bates, Bobtail, Mammoth, Hunter, and many other lodes, then newly discovered, one hundred and fifty dollars a day for weeks together. Single pans of dirt could be taken up carefully from any of a dozen lodes, that would yield five dollars.
>
> Ziegler, Spain & Co. ran a sluice three weeks on the Gregory and cleaned up three thousand pennyweights, [worth about eighty cents each,] their highest day's work yielding four hundred and ninety-five dollars, their lowest twenty-one dollars. Sopris, Henderson & Co. took out six hundred and seven dollars in four days, and on a subsequent day, two hundred and eighty dollars. Shears & Co., two days, eight hundred and fifty-three dollars, —all taken from within three feet of the surface. Brown & Co., one and a half days, two hundred and sixty dollars; John H. Gregory, five days, nine hundred and forty-two dollars; Casto, Kendall & Co., one day, two hundred and twenty-five dollars; S. C. Jones & Co., two days, four hundred and fifty dollars; Bates & Co., one and a half days, one hundred and thirty-five dollars; Colman, King & Co., one-half day, seventy-five dollars; Defrees & Co., twelve days, with one sluice, two thousand and eighty dollars. In one day Leper, Gridley & Co. obtained one thousand and nine dollars from three sluices. One sluice washed out in one day five hundred and ten dollars. Foote & Simmons realized three hundred dollars in three days. The Illinois Company obtained one hundred and seventy-five dollars in their first day's sluicing from the Brown Lode in Russell District. Walden & Co., took in one day from a lode in the same district, one hundred and twenty-five dollars. Jacob Pogue took five hundred dollars from a lode in the same district in three days. Three men took from the Kansas Lode, in two days, five hundred dollars. Kehler, Patton & Fletcher averaged with five hands on the Bates Lode one hundred dollars a day for two months. Day & Crane on the same lode, with seven or eight hands, sluiced for ten weeks, their smallest weekly run being one hundred and eighty dollars, their largest; three hundred and fifty-seven dollars. J. C. Ross & Co., with four hands, averaged a hundred dollars a day on the Fiske Lode for four months. F. M. Cobb & Co., on the Bobtail Lode, with four men, averaged from seventy-five to one hundred dollars a day for two months. Heffner, McLain & Cooper worked four men at a sluice on the Clay County Lode, averaging one hundred dollars a day for ten weeks. Shoog & Co. averaged one hundred dollars a day for three months, sluicing with five men on the Maryland Lode."

Results at the Jackson diggings were not, in a general way, so prolific as those at the Gregory, though many thousands of dollars' worth of the yellow metal rewarded the men who followed in there immediately after Jackson's discovery. The mining in the vicinity of Chicago creek was, to a greater extent, of the placer character, and Jackson's Bar was exceedingly rich in gold. A little placer mining is still going on in that vicinity, but as a mining proposition that kind of work long since ceased to be of much importance anywhere in the Clear creek country.

By the first of June about three hundred men were working in the vicinity of the mouth of Chicago creek, and were taking out from three to five dollars a day to the man, as a general average. Of course, some were many times exceeding those amounts, but the yields did not, as a whole, approach those of the Gregory district. Later in the summer there were some fifty sluices running at Spanish Bar two miles farther up the creek. The facilities at Jackson's were inadequate and the conditions troublesome. Companies were finally formed to flume the creek for the purpose of getting at its bed, thought to be very rich. After considerable hard labor and heavy expense the experiment did not meet anticipations. At Spanish Bar the stream was rapid in a narrow rough valley, the deposits were masses of bowlders of all sizes, the gold deep-buried in the bed of the creek, and the pits were persistently flooded with water. These difficult conditions were quite different from those at the Gregory Diggings, where the trouble was so much less and the yield so much more. In after years under different methods and circumstances, the Jackson district proved its enormous permanent value as a producer of gold.

Jackson's Chicago company organized the first mining district in this Denver region. This was done on the 17th of April, 1859, as hitherto stated; but civil officers were not elected until late in the summer. Immediately after the first parties of outsiders came in, the need for further organization became apparent. Therefore, a general meeting of the miners was held on the 9th of May, at which the limits of the original district were enlarged, and more specific rules and regulations for its government adopted. These regulations were the basis for those of nearly all the subsequently organized districts in the Clear creek country. The rules applying to claims were as follows:

> "1. Each claim shall be fifty feet front by two hundred and fifty feet deep.
>
> "2. Every claim shall be marked and staked with at least two stakes, and shall be improved within ten days after taking.
>
> "3. The discoverers of new diggings shall be entitled to one extra claim each."

On Fall river, a tributary of South Clear creek, just above Spanish Bar, several lodes were discovered and preparations made for developing them. Slides were constructed for letting down the dirt and quartz from the mountain-side where the metal-bearing material was found mostly in narrow crevices. Ditches for conveying water, and much other expensive preliminary mining work was done there that season, but in actual results the returns were not very large for the amount of money and labor expended on the preparations.

The principal camp on this part of Clear creek grew up opposite the Jackson diggings, and it was the beginning of the present city of Idaho Springs. The next year it took on form and ambitions of a permanent town, with a duly organized town government. Near the mouth of Fall river was located the camp of Spanish Bar, and in the same vicinity Grass Valley and Fall River camps were established.

In this first season of real gold-mining, the then baffling obstacles called "caps" or "pinches" were encountered by some of the miners as they sunk their shafts to follow the veins. These are places where the granite walls, between which are the gold-bearing veins, come nearly or close together, pinching out the valuable seam of quartz. This condition often exists to considerable depths, which are, of course, unknown in extent to the operator who, if he continues his shaft to the point where the vein or crevice opens out again to its former or greater proportions, does so upon faith, and his reserve capital, if he has any. In the early days of 1859 and 1860, after this "cap" was first struck, mine-owners, believing their claims to be exhausted, or "played out," sold them for a pittance—for whatever they could get. In later years many such "capped" mines were opened through the obstructions and yielded enormous values in gold from the recovered veins.

The written and unwritten history of mining in Colorado contains many stories of "luck in mining strikes;" of discoveries by accident; by men ignorant of mineralogy and mining methods; and by men with neither intention nor expectation of finding gold or silver. While the larger number of these narrations are fiction, pure and often very simple, some of them are true. But the discoveries of Jackson and Gregory were the results of patient, intelligent prospecting for what they eventually found. They sought it where men of practical experience would expect to locate mines of permanent resources, and the element of so called "luck" cuts a small figure in what they succeeded in doing. Thousands who followed them into the mountains soon came out again execrating their "luck," or the lack of it, with no better reason for doing so, than there has been in later years for attributing nearly every important mining discovery to the whims of the alleged goddess of chance.

CHAPTER XXIX.

Horace Greeley's First Visit—A. D. Richardson and Henry Villard—Mr. Greeley's Adventures—Impressions of Denver—Excitement Over Clear Creek Discoveries—Visitors Go to Gregory Diggings—Mishaps to Greeley and Richardson—Famous Report of Greeley, Richardson, and Villard—Greeley's Speech at Gregory, and Lecture in Denver—His Theories of Mining—Richardson's Comments on Conditions in Denver—Greeley's Departure—Influence of His Writings in His Tribune.

One morning in June, 1859, a stage-coach of the new line from Leavenworth brought as a passenger to Denver, Horace Greeley, the famous editor of the New York Tribune, on his celebrated journey across the continent. He was accompanied here from Leavenworth by Albert D. Richardson, who was then a correspondent of the Boston Journal, and had been on duty in eastern Kansas during the most turbulent period in the Territory's stormy history. Richardson returned to Denver the following year and became identified with affairs here until his sojourn was terminated by the outbreak of the civil war, when he went back east and began his distinguished services as a newspaper war correspondent.

Upon their arrival Greeley and Richardson met another visiting newspaper man who had come here in April. This was Henry Villard, then a correspondent of the Cincinnati Commercial. In later years he became identified with the Northern Pacific Railroad, serving as its President during much of its construction period and for several years after its completion.

In addition to his newspaper work, Mr. Richardson had served in 1857-58 as Assistant Adjutant General to one of the several factional "governments" of Kansas Territory, and as a member of the recognized Territorial Legislature in the winter of 1858-59, which body had cut up this then western end of Kansas Territory into several proposed counties. He had been appointed one of the Commissioners to organize the projected new county in which Denver was situated, and to do so was one of the objects of his visit. The particulars of these affairs will be found in a subsequent chapter dealing with the history of Arapahoe county. Richardson's western experiences, including those of journeys made after the close of the civil war, were published in 1867 in an interesting and valuable volume entitled "Beyond the Mississippi."

On their long ride to Denver Greeley and Richardson had a full share of the picturesque adventures that fell to the lot of overland stage passengers in those days, including that of a stampeded four-mule-team, which overturned and wrecked the coach. Mr. Greeley was severely bruised and cut by the mishap, suffering from his injuries for several weeks. In his book Mr. Richardson gave this account of the accident:

> "Descending an abrupt hill, our mules, terrified by meeting three savages, broke a line, run down a precipitous bank, upsetting the coach which was hurled upon the ground with a tremendous crash, and galloped away with the fore-wheels. I sprang out in time to escape being overturned. From a mass of cushions, carpet-sacks and blankets soon emerged my companion, his head rising above the side of the vehicle like that of an advertising boy from his frame of pasteboard. Blood was flowing profusely from cuts in his cheek, arm and leg; but his face was serene and benignant as a May morning. He was soon rescued from his cage, and taken to Station Seventeen, a few yards beyond, where the good woman dressed his galling wounds."

A portion of Richardson's narrative is arranged in form of a diary, and from it we quote:

> "June 6—Woke at five o'clock, still in motion, and obtaining a glorious view of the mountains, their hoary peaks covered with snow and their base, thirty miles across the valley into which we were descending, seeming not more than two miles away."
>
> "At last we struck the old trail from Santa Fe to Salt Lake, rode a mile along the dry bed of Cherry creek, and at eight, this eleventh morning, reached Denver City. Day-and-night's travel, one hundred and thirty miles. During our journey from Leavenworth we have doubtless passed ten thousand emigrants."
>
> "Making governments and building towns are the natural employments of the migratory Yankee. He takes to them as instinctively as a young duck to water. Congregate a hundred Americans anywhere beyond the settlements, and they immediately lay out a city, frame a State constitution and apply for admission to the Union, while twenty-five of them become candidates for the United States Senate."
>
> "True to this instinct, the people of this unfledged community, nominally in Kansas but prac-

tically as far from government and civilization as central Africa, were already making a State constitution; and months before, they had laid out Denver City."

"It was a most forlorn and desolate-looking metropolis. If my memory is faithful, there were five women in the whole gold region; and the appearance of a bonnet in the street was the signal for the entire population to rush to the cabin doors and gaze upon its wearer as at any other natural curiosity. The men who gathered about our coach on its arrival were attired in slouched hats, tattered woolen shirts, buckskin pantaloons and moccasins, and had knives and revolvers suspended from their belts."

"We took lodging at the Denver House. True to national instinct, the occupants of its great drinking and gambling saloon demanded a speech. On one side, the tipplers at the bar silently sipped their grog; on the other, the gamblers respectfully suspended the shuffling of cards, and the counting of money from their huge piles of coin, while Mr. Greeley standing between them, made a strong anti-drinking and anti-gambling address, which was received with perfect good humor."

On this day, June 6th, the convention called by the meeting of April 11th, in Auraria, to draft a constitution for a new State, assembled in "Denver City," but adjourned without definite action, to meet again on the 1st of August. It was to many of these State-builders that the great editor made his speech. Mr. Greeley was writing letters to the Tribune telling of his travels, and in one written at Denver on the day of his arrival, he said:

"As to gold, Denver is crazy. She has been low in the valley of humiliation, and is suddenly exalted to the summit of glory. The stories of day's work and rich leads that have been told me to-day—by grave, intelligent men—are absolutely bewildering."

Nearly everybody then around here had been hunting for gold and a few had just found it. Under date of June 6th, Mr. Richardson ("Beyond the Mississippi") says:

"Thus far no gold had been discovered within sixty miles of Pike's Peak, but the first reports located the diggings near that mountain, and 'Pike's Peak,'—one of those happy alliterations which stick like a burr in the public memory—was now the general name for this whole region."

"The first extravagant statements had all been based on supposition. Prospectors found 'the color'—infinitesimal quantities of the shining dust—and nothing more, chiefly in the bed of the Platte. The mountains had not been searched to any extent. So little confidence was felt in the mines, that in Denver, picks commanded only ten or fifteen cents apiece, and town lots and log-houses were bartered for revolvers, or sold for ten or twenty dollars. Of the few men engaged in mining not half a dozen were realizing one dollar per day."

"But on the sixth day of May—just one month before our arrival—John H. Gregory, an old Georgia miner, struck rich deposits of gold in the mountains among the headwaters of the Clear creek; and from that discovery dates the history of Pike's Peak as an ascertained gold region."

At this time the excitement over the rich discoveries of Gregory and Jackson was tremendous and all interest centered upon them. On the morning of June 8th, Mr. Greeley and his party with an escort of several Denver men set out on a visit to the "Gregory Diggings." They proceeded across to the foot-hills by wagon, and the distinguished editor, who believed himself something of a farmer, also, noted that a few makeshift beginnings at agriculture were visible on that side of the river. Arriving at the foot-hills they mounted mules for the remainder and rather rough part of the journey. Wholly unused to this mode of traveling, the Tribune's editor had a hard time of it. At their occasional stopping places he had to be assisted off his mule, and needed help again when the time came for mounting. But he stuck manfully to his task and his mule, and made the trip both ways without undue complaint.

Mr. Greeley's Mishap.
(From Richardson's sketch.)

When the visitors reached Clear creek they found the water of that stream running high. Mr. Greeley started in on his mule, which soon had to swim, and from swimming took to floundering with dangerous consequences to the rider. Mr. Greeley would probably have drowned had his companions not gone quickly to his assistance.

While returning, Mr. Villard, when going down a steep declivity, was pitched from his mule and severely hurt. The party got back to Denver in the morning of June 10th, and the newspaper men made public in a written statement, their opinions, observations and ascertained facts of the conditions, prospects and actual results on Clear creek.

This document was given a wide circulation over the country and was the first definite, authentic and satisfactory statement made by well-known men about the Pike's Peak gold discoveries. It undoubtedly had great influence in shaping the events of the next few years. The report or statement was published in an extra edition of the Rocky Mountain News, on Saturday, June 11, 1859—to the exclusion of nearly everything else—with a prefactory note by the editor, as follows:

"We are indebted to the kindness of Mr. Williams, of the Leavenworth & Pike's Peak Express, for the following report from Messrs. Greeley, Richardson and Villard, which will give satisfaction to the public mind, and at once set at rest the cry of "humbug" reiterated by the returning emigration from this region. The names of the gentlemen signed to this report are sufficient to give it credence without further comment from us; and the indefatigable exertions of Mr. Williams to get it before the public are commendable:"

Denver City, K. T., June 10th, 1859.

Gentlemen:—Will you do me the favor to furnish me for publication, such facts in reference to the Gold Mines, as you obtained upon your recent visit to them, in company with myself and others? We desire that the facts should be presented to the public as they exist.

Yours respectfully,
B. D. Williams,
Agent "Jones' & Russell's P. P. Express Co."

Messrs. Horace Greeley of the New York "Tribune;" A. D. Richardson of the Boston "Journal;" and Henry Villard of the Cincinnati "Commercial."

Denver City, K. T., June 10, 1859.

Dear Sir:—In reply to your favor of this morning, we herewith submit a report, written at the "Gregory Diggings," of such facts as we witnessed there, and obtained from the lips of the miners. We have endeavored to make it definite and specific as possible, and give an unbiased statement of the present condition and progress of the first important gold discoveries in the eastern slope of the Rocky Mountains.

We desire to acknowledge your many courtesies during the trip.

Respectfully,
Horace Greeley,
A. D. Richardson,
Henry Villard.
B. D. Williams, Esq.

Gregory's Diggings, near Clear Creek,
In the Rocky Mountains, June 9, 1859.

The undersigned, none of them miners, nor directly interested in mining, but now here for the express purpose of ascertaining and setting forth the truth with regard to a subject of deep and general interest, as to which the widest and wildest diversity of assertion and opinion is known to exist, unite in the following statement:

We have this day personally visited nearly all the mines or claims already opened in this valley, (that of a little stream running into Clear creek at this point;) have witnessed the operation of digging, transporting, and washing the vein-stone, (a partially decomposed, or rotten, quartz, running in regular veins from southwest to northeast, between shattered walls of an impure granite;) have seen the gold plainly visible in the riffles of nearly every sluice, and in nearly every pan of the rotten quartz washed in our presence; have seen gold, (but rarely) visible to the naked eye, in pieces of the quartz not yet fully decomposed, and have obtained from the few who have already sluices in operation accounts of their several products, as follows:

Ziegler, Squire & Co., (from South Bend, Ind.) have run a sluice, with some interruptions, for the last three weeks; they are four in company, with one hired man. They have taken out a little over three thousand penny-weights of gold, estimated by them as worth at least $3,000; their first day's work produced $21; their highest was $495.

Sopris, Henderson & Co., (from Farmington, Indiana) have run their sluice six days in all, with four men—one to dig, one to carry, and two to wash; four days last week produced six hundred and seven dollars; Monday of this week, two hundred and eighty dollars; no further reported. They have just put in a second sluice, which only began to run this morning.

Defrees & Co., (from South Bend, Ind.,) have run a small sluice eight days, with the following results: first day, $66; second day, $80; third day, $95; fourth day, $305. (The four following days were promised us, but by accident, failed to be received.) Have just sold half their claim, (a full claim is 50 feet by 100) for $2,500.

Shears & Co., (from Fort Calhoun, Nebraska,) have run one sluice two hours the first, (part of a) day; produced $30; second, (first full) day, $343; third (to-day) $510; all taken from within three feet of the surface; vein a foot wide on the surface; widened to eighteen inches at a depth of three feet.

Brown & Co., (from De Kalb Co., Ind.,) have been one week on their claim; carry their dirt half a mile; have worked their sluice a day and a half; produced $260, pure; taken out quartz specimens containing from 50 cents to $13 each in gold; vein from eight to ten feet wide.

Casto, Kendall & Co., (from Butler Co., Iowa,) reached Denver March 25; drove the first wagon to these diggings; have been here five weeks; worked first on a claim, on which they ran a sluice but one day; produced $225; sold their claim for $2,500; are now working a claim on the Hunter lead; have only sluiced one, (this) day; three men employed; produced $85.

Bates & Co., one sluice, run half a day; produced $135.

Colman, King & Co., one sluice, run half a day; produced $75.

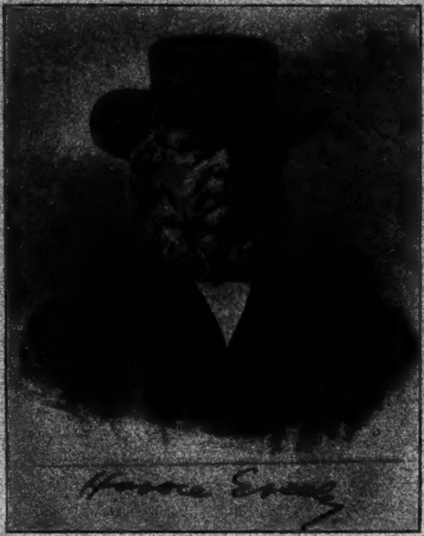
Shorts and Collier: "Bought our claim seven days since of Casto, Kendall & Co., $2,500; $500 down, and the balance as fast as taken out. Have not yet got our sluices in operation. Mr. Dean, from Iowa, on the 6th inst., washed from a single pan of dirt taken from the claim, $17.80. Have been offered $10,000 for the claim."

S. C. Jones & Co., (from eastern Kansas.) "Have run our sluices two days, with three men; yield, $225. per day. Think the quartz generally in this vicinity is gold-bearing. Have never seen a piece crushed that did not yield gold."

A. P. Wright & Co., (from Elkhart Co., Ind.) "Sluice but just in operation; have not yet ascertained its products—Our claim prospects from 25 cents to $1.25 to the pan."

John H. Gregory, (from Gordon Co., Georgia.) "Left home last season, "en route" for Frazier river, was detained by a succession of accidents at

Ft. Laramie, and wintered there. Meanwhile, heard of the discoveries of gold on the South Platte, and started on a prospecting tour on the eastern slope of the Rocky Mountains, early in January. Prospected in almost every valley, from the Cache de Poudre creek, to Pike's Peak, tracing many streams to their sources. Early in May arrived on Clear Creek, at the foot of the mountains, 30 miles southeast of this place. There fell in with the Defreese & Ziegler Indiana Companies, and William Fouts, of Missouri. We all started up Clear Creek, prospecting. Arrived in this vicinity, May 6; the ice and snow prevented us from prospecting far below the surface, but the first pan of surface dirt, on the original Gregory claim, yielded $4. Encouraged by this success, we all staked out claims, found the "lead" consisting of burnt quartz, resembling the Georgia mines, in which I had previously worked. Snow and ice prevented the regular working of the lead till May 16th. From then until the 23d, I worked it five days with two hands, result, $972. Soon after, I sold my two claims for $21,000, the parties buying, to pay me, after deducting their expenses, all they take from the claims, to the amount of $500 per week, until the whole is paid. Since that time, I have been prospecting for other parties, at about $200 per day. Have struck another lead on the opposite side of the valley, from which I washed $14 out of a single pan."



Some forty or fifty sluices commenced, are not yet in operation; but the owners inform us that their "prospecting" shows from 10 cents to $5 to the pan. As the "leads" are all found on the hills, many of the miners are constructing trenches to carry water to them, instead of building their sluices in their ravines, and carrying the dirt thither in wagons, or sacks. Many persons who have come here without provisions or money, are compelled to work as common laborers, at from $1 to $3 per day and board, until they can procure means of sustenance for the time necessary to prospecting; building sluices, etc. Others, not finding gold the third day, or disliking the work necessary to obtaining it, leave the mines in disgust, after a very short trial, declaring there is no gold here in paying quantities. It should be remembered that the discoveries made thus far are the result of but five week's labor.

In nearly every instance, the gold is estimated by the miners as worth $20 per ounce, which, for gold collected by quicksilver, is certainly a high valuation, though this is, undoubtedly of very great purity. The reader can reduce the estimate if he sees fit. We have no data on which to act in the premises.

The wall rock is generally shattered, so that it, like the vein-stone, is readily taken out with the pick and shovel. In a single instance, only, did we hear of wall-rock too hard for this.

Of the vein-stone, probably, not more than one-half is so decomposed that the gold can be washed from it. The residue of the quartz is shoveled out of the sluices and reserved to be crushed and washed hereafter. The miners estimate this as equally rich with that which has "rotted" so that the gold may be washed from it; hence, that they realize, as yet, but half the gold dug by them. This seems probable, but its truth remains to be tested. It should be borne in mind, that, while the miners here now labor under many obvions disadvantages, which must disappear with the growth of their experience and the improvement of their now rude machinery, they, at the same time, enjoy advantages which can not be retained indefinitely, nor rendered universal. They are all working very near a small mountain stream, which affords them an excellent supply of water for washing at a very cheap rate; and, though such streams are very common here, the leads stretch over rugged hills and considerable mountains, down which the vein-stone must be carried to water, at a serious cost. It does not seem probable that the thousands of claims already made, or being made, on these leads, can be worked so profitably in the average as those already in operation. We hear already of many who have worked their claims for days (by panning) without having "raised the color" as the phrase is—that is, without having found any gold whatever. We presume thousands are destined to encounter lasting and utter disappointment, quartz veins which bear no gold being a prominent feature of the geology of all this region.

We can not conclude this statement without protesting most earnestly against the renewal of the infatuation which impelled thousands to rush to this region a month or two since, only to turn back before reaching it, or to hurry away immediately after more hastily than they came. Gold-mining is a business which eminently requires of its votaries capital, experience, energy, endurance, and in which the highest qualities do not always command success. There may be hundreds of ravines in these mountains as rich in gold as that in which we write, and there, probably, are many; but, up to this hour, we do not know that any such have been discovered. There are said to be five thousand people already in this ravine, and hundreds more pouring in daily. Tens of thousands more have passed by us on our rapid journey to this place, or heard of as on their way hither by other routes. For all these, nearly every pound of provisions and supplies of every kind must be hauled by teams from the Missouri river, some 700 miles distant, over roads which are mere trails, crossing countless unbridged water-courses, always steep-banked and often mirey, and, at times, so swollen by rains as to be utterly impassable by wagons. Part of this district is a desert, yielding grass, wood and water only at intervals of several miles, and then very scantily. To attempt to cross the desert on foot is madness—suicide—murder. To cross it with teams in midsummer, when the water-courses are mainly dry, and the grass eaten up, is possible only to those who know just where to look for grass and water, and where water must be carried along to preserve life. A few months hence—probably by the middle of October—this whole Alpine region will be snowed under and frozen up, so as to put a stop to the working of sluices, if not to mining altogether. There, then, for a period of at least six months, will be neither employment, food nor shelter within five hundred miles for the thousands pressing hither under the delusion that gold may be picked up here like pebbles on the sea-shore, and that, when they arrive here, even though without provisions or money, their fortunes are made. Great disappointment, great suffering, are inevitable; few can escape the latter who arrive in Denver City after September without ample means to support them in a very dear country, at least through a long winter. We charge those who manage the telegraph not to diffuse a part of our statement without giving, substantially, the whole; and we beg the press generally to unite with us in warning the whole people against another rush to these gold mines, as ill-advised as that of last spring—a rush sure to be followed, like that, by a stampede, but one far more destructive of property and life.

Respectfully,
Horace Greeley,
A. D. Richardson,
Henry Villard.

Of the few living pioneers who were intimately associated with the early history of newspapers in Denver, is General George West, the present proprietor of the Golden Transcript. He was one of the printers who put this one-time famous report in type. Concerning its publication General West lately wrote Curator Ferril of the Historical Society:

"According to my recollection it was the 10th of June (Saturday), 1859, that it was printed, but it might have been dated the next day. My party had just arrived from across the plains and about noon were pulling through the sand of Cherry Creek at the Blake street crossing, twenty or thirty teams of us, when we heard a shout from a man standing on a little foot bridge which crossed the creek at that point. It proved to be old man Gibson of The News.

" 'Hey there!' he ejaculated, 'are there any printers in this crowd?'

"I told him there were two or three of us. He then asked us to go into camp and come up and set up an extra for him. As we were uncertain about what we were going to do even now that we had reached 'Pike's peak,' we concluded to do as he requested. Bill Summers, Mark Blunt, late of Pueblo, and I went to the office, then located in a one-and-a-half-story log cabin on Ferry street, now Eleventh street, where we found Horace Greeley, A. D. Richardson and Henry Villard, who had just returned from the mountains, and the News wanted to publish their report in an extra. We then buckled to, set it up and worked off, I believe, 500 copies on the old Washington hand press, the handle of which you have in your collection. For this we received five pennyweight of gold dust.

"Now old man Gibson is dead, Horace Greeley is dead, A. H. Richardson is dead, Bill Sommers and Mark Blunt are dead, leaving only Mr. Byers, Mr. Villard and myself as survivors of that wonderful coterie to whom the world owes so much for the production of that celebrated extra."

Gregory Gulch in June, 1859.

Mr. Villard visited Denver in April, 1899, upon the fortieth anniversary of his first coming, and remained until after the fortieth anniversary of the birth of Denver's pioneer newspaper. He died at his home near New York city in the autumn of 1900.

Some incredulous people in the east and other parts, after reading the "statement," asserted that Mr. Greeley and his friends had been imposed upon, and that the mines and reports of results were "salted" in anticipation of their coming. There was nothing in this. Few of the miners knew the party was in the country, and the visit to Gregory's was unheralded.

Of course, the first thing that was done after the party inspected the diggings, was to have a public meeting and some speeches, after the good old American fashion. Upon a verbal notice passed around in a few hours, a crowd of between two thousand and three thousand people assembled in the evening to hear the visitors talk. In the Rocky Mountain News, of June 18th, the following condensed report of Mr. Greeley's remarks was published:

"The Hon. Horace Greeley, the first speaker, was received with three cheers. He alluded to the cheering indications he had seen during the day in examining the mines and sluices. He had always had a suspicion—from which he was not yet entirely free—that these mines would not prove equal in richness to those of California; but in view of the great discoveries of the last few weeks, there was evidently a vast future before this region. It was by no means probable that all the gold of the eastern slope was confined to this little area of seven or eight miles. He advocated the formation of a new State, and trusted that one might be made and brought into the Union, without going through the troublesome and undemocratic form of a Territorial organization. He spoke at length of the peculiar temptations to drinking, gaming, etc., to which the miners were exposed, urging a steadfast resistance and avoidance; exhorting his hearers to look to untiring industry instead of speculation for their gains; to maintain good order, to live as the loved they had left—the brothers, sisters, fathers, mothers, wives and children—would wish; that when they returned they might carry with them the reward of their labors. If a gambler, after being warned not to do so, should persist in coming among them, he advised putting him on a good mule, headed out of the mountains, and asking him if he would not like to ride. He should in a few days go hence to Salt Lake and California, and it was one purpose of this trip to do what he could to hasten the construction of the Pacific Railroad, which ought to have been built long ago. He was rousingly cheered on retiring."

The other gentlemen followed Mr. Greeley and, as an early chronicler remarks, the outbursts of oratory "must have been quite a grief as well as a surprise to the bears and mountain lions which had heretofore reigned sole monarchs of these wilds."

On Sunday evening following—the 12th of June—Mr. Greeley obligingly delivered a public lecture in Denver, the first heard in the new city. It was a temperance address, and there were some reasons for believing the good man sowed his seed on a not extremely fertile soil.

Mr. Greeley also endeavored to smooth down the intense rivalry then existing between Denver City and Auraria City; pointing out that they were practically one community and should act as one; and be one in theory as well as in fact. But his good counsels fell on unheeding ears.

The appearance and conditions of those who were here and those who were coming in droves, touched the gentle heart of the philanthropic visitor, and moved him to say in one of his letters from Denver:

"I fervently trust that the fond expectations of these gold-seekers, may not be disappointed. For the sake of the weary, dusty, foot-sore thousands I have passed on my journey, from civilized Kansas to this point, I pray that gold may be found here in boundless extent, and reasonable abundance. Throughout the next six weeks, they will be dropping in here, a hundred or more per day; and I trust they are not to be sent home disappointed, spirit-broken, penniless. If they must re-cross the great desert with their slow-moving teams, may they be enabled to do so with lighter hearts and heavier purses."

The great editor would probably have made a good miner himself, had he taken to the business, for he quickly saw that surface or placer mining would not last long, and that the real, permanent resources were buried far under ground. He was not confident that "disemboweling these mountains in quest of gold" would pay. It might pay some; others it would not. In a letter to the Tribune from Denver, dated June 10th, he said:

"Mining is a pursuit akin to fishing and hunting, and, like them, enriches the few at the cost of the many. This region is doubtless fore-ordained to many changes of fortune; to-day, giddy with the intoxication of success—to-morrow, in the valley of humiliation. One day, report will be made on the Missouri by a party of disappointed gold seekers, that the Pike's Peak humbug has exploded, and that everybody is fleeing to the States, who can possibly get away; the next report will be representing these diggings as yellow with gold."

"New leads will doubtless be discovered, new veins be opened, new "diggings" or districts become the rage—for it were absurd to suppose that little ravine known as Gregory's, running to Clear Creek, the sole depository of gold worth working in all this region—and in time the Rocky Mountains will swarm with hardy, industrious, energetic white population. Not gold alone, but lead, iron, and (I think) silver or cobalt, have already been discovered here, and other valuable minerals doubtless will be, as the Rocky Mountains are more thoroughly explored—for as yet they have not been even run over."

"Thousands who rush hither for gold, will rush away again disappointed and disgusted, as thousands have already done; and yet, the gold is in these mountains, and the right men will gradually unearth it. I shall be mistaken if two or three millions are not taken out this year, and some ten millions in 1860, though all the time there will be, as now, a stream of rash adventurers heading away from the diggings, declaring that there is no gold there, or next to none."

After their return from Gregory's, the visiting newspaper men remained in Denver about two weeks. Some account of the incidents of their stay and their local observations of things and conditions then existing here, is contained in the following extracts from Mr. Richardson's "Beyond the Mississippi:"

"The excitement of the journey over, Mr. Greeley's wounded limb, which had enjoyed no rest since the capsizing of the coach, grew excessively painful and confining. The Denver House with its ceaseless noise and gambling, proved unfavorable to literary pursuits; so, according to the custom of the country we 'jumped a cabin:'—selected the best one we could find, moved in our effects, and took possession."

'Imagination fondly stoops to trace
The parlor splendors of that festive place.'

"It was twelve feet square, of hewn pine logs new and smooth, the cracks within chinked with wood and outside plastered with mud. A great fireplace of sticks and dried soil occupied one corner. A single chair of elders fresh from the forest, with the bark still on, a little table of the same material, and the rare luxury of a mattress resting upon slats laid from one log to another, constituted the furniture. The roof was of baked mud upon a layer of split logs and grass; the floor of hard smooth earth. No window invited adventurous burglars, and the solitary door which swung upon wooden hinges, opened to the touch of no key but a pen-knife. We extemporized a shelf from which a few curiously assorted books looked down with a bewildered air, carpeted the ground with coffee sacks—and did we not take our ease in our inn!"

"A few days later, the owner of the cabin came down from the mines and looked in upon us quite unexpectedly; but observing that the nine points of the law were in our favor, he apologized humbly for his intrusion, (most obsequious and marvelous of land-lords!) begged us to make ourselves entirely at home, and then withdrew, to jump the best vacant cabin he could find, until the departure of his non-paying tenants. We design exhibiting him at the next world's fair as the best specimen of the Polite Gentleman on the terrestrial globe."

Richardson's Sketch of himself upon his return to Denver in 1860.

"There was little business; money was in great demand and loaned on collateral security at twenty-five per cent a month."

"The experience of every mining region demonstrates that salt pork is the most nutritive and stimulating diet for miners, whose labor is the most exhausting in the whole world. All plains travelers also use it, on the theory of the shrewd philosopher, that no other substance contains 'so much board in so little compass.' As agriculture was not begun, vegetables were not attainable for love or money. Late in the season, however, a few enormous watermelons appeared in market, selling at two or three dollars apiece. The chief meat was antelope, always abundant at four cents a pound. Though more tasteless than the flesh of the deer, it is pleasant and nutritive."

"Denver society was a strange medley. There were Americans from every quarter of the Union, Mexicans, Indians, half-breeds, trappers, speculators, gamblers, desperadoes, broken-down politicians and honest men. Almost every day was enlivened by its little shooting match. While the great gaming saloon was crowded with people, drunken ruffians sometimes fired five or six shots from their revolvers, frightening everybody pell-mell out of the room, but seldom wounding any one. One day I heard the bar-keeper politely ask a man lying upon a bench to remove. The recumbent replied to the request with his revolver. Indeed, firing at this bar-tender was a common amusement among the guests. At first he bore it laughingly, but one day a shot grazed his ear, whereupon, remarking that there was such a thing as carrying a joke too far and that this was about played out, he buckled on two revolvers and swore he would kill the next man who took aim at him. He was not troubled afterward."

"Gaming was universal. Denver and Auraria (now West Denver,) contained about one thousand people, with three hundred buildings, nearly all of hewn pine logs. One-third were unfinished and roofless, having been erected the previous winter for speculative purposes. There were very few glass windows or doors and but two or three board floors. The nearest saw-mill was forty miles away, and the occupants of the cabins lived upon the native earth, hard, smooth and clean swept. One lady, by sewing together corn-sacks for a carpet and covering her log walls with sheets and table-cloths, gave to her mansion an appearance of rare luxury. Chairs were glories yet to come. Stools, tables, and pole-bedsteads were the staple furniture, while rough boxes did duty as bureaus and cupboards. Hearths and fire-places were of adobe, as in Utah, California and Mexico. Chimneys were of sticks of wood piled up like children's cob-houses, and plastered with mud. A few roofs were covered with shingles split by hand, but most were of logs spread with prairie grass and covered with earth. They turned water well, even during the daily showers of June and July. During the rest of the year rain is unknown."

"Between my cabin and the Denver House were a dozen Indian lodges, enlivened by squaws dressing the skins of wild animals or cooking pupoies for dinner, naked children playing in the hot sand, and braves lounging on the ground, wearing no clothing except a narrow strip of cloth about the hips."

"Hundreds of immigrants passed through daily; their white, unending caravans stretching across the river to the foot of the range. Daily, too, a great refluent wave rolled in from the mountains—dissatisfied miners who sold their superfluous provisions and tools at less than cost, and started for California or turned homeward."

"The Denver House was a long, low, one-story edifice, one hundred and thirty feet by thirty-six, with low walls, and windows and roof of white sheeting. In its spacious saloon, the whole width of the building, the earth was well sprinkled to keep down dust. The room was always crowded with swarthy men armed and in rough costumes. The bar sold enormous quantities of cigars and liquors. At a half-dozen tables the gamblers were always busy, day and evening. One, in a woolen shirt and jockey cap, drove a thriving business at three-card-monte, which netted him about one hundred dollars per day. * * * "

"As a class, the gamblers were entertaining in conversation, had curious experiences to relate, evinced great knowledge of human nature, and were especially kind to each other in misfortune. Some were gentlemanly in manners. Like all men who gain money easily, they were open-handed and charitable. I never saw a place where more dollars could be obtained in less time for a helpless woman or orphan than among gaming tables."

"I saw the Probate Judge of the county lose thirty Denver lots in less than ten minutes, at cards, in this public saloon on Sunday morning;

and afterwards observed the county Sheriff pawning his revolver for twenty dollars to spend in betting at faro. There were no women and children; and hence none of that public opinion without which few men can stand alone."

"One New Yorker still under thirty-five had been successively owner of a Lake Erie steamer, captain of a Cape Cod fishing craft, professional gambler in Cuba, real estate speculator in Leavenworth, and stage-driver on the great plains. Here he was a successful lawyer. But when last I saw him he had been a cripple for months—the result of an accidental shot from the pistol of his law-partner who had taken a drop too much. Among the Denver pioneers I found a relative whom I last met as a New York wholesale merchant, in the glossiest of broadcloth and the most spotless of linen. Now he wore the half-Mexican, half-Indian costume of the country. One of the chief thoroughfares, Blake street, still bears his name."

"Denver had its weekly Rocky Mountain News. Editor and printers cooked, ate and slept in the one room of the log building where articles were written, type set and paper worked off."

"There were no public mails. Private enterprise is always far in advance of Government, and the express company brought all letters from the Missouri river—one thousand per day—for twenty-five cents each."

"There was no paper money and the smallest coin in circulation was twenty-five cents. The people of the frontier have never taken kindly to coppers. * * * In Kansas three-cent pieces passed for five cents, and in New Mexico eight dimes for one dollar."

Of Mr. Greeley's further movements the author of "Beyond the Mississippi," says:

"For two weeks after our return from the mountains Mr. Greeley lay prostrate with his lame leg. Indeed, the injury was so severe that a year later he still limped. But on the twenty-first of June he continued the then dangerous journey across the continent. In Green river he lost his valise; but it was fished out by an honest emigrant and months later reached its owner in New York. At Salt Lake he spent several days among the saints; then passed on through the present State of Nevada (containing when he traversed it less than a hundred white inhabitants), and across the Sierra Nevadas to California. There he was visited with the traditional annoyance of plains travelers—boils which covered his body, compelling him to return home by steamer instead of the Butterfield [the southern] overland route."

Mr. Greeley's letters to the Tribune, and his subsequent editorial work based on knowledge of the country acquired by his journey across the continent, were of the greatest value to the west, and especially to the interests of Colorado. His services were of inestimable influence in hastening the beginning of the first railroad to the Pacific, and in promoting the settlement and development of the country west of the Missouri river. His famous advice to the employment-seeking individual in the east: "Go west, young man!" was the crystallization of his experience, observations and conclusions at the time he first visited the west. His letters written while on this noted pilgrimage were republished in book form, in 1860, under the title: "An Overland Journey."

CHAPTER XXX.

New Towns in Denver Region—Extension of Gold Discoveries—Founding of Golden—Wall's Pioneer Agriculture—Golden Gate—Mountain City—Blackhawk—Central City—Georgetown—Newspapers—Missouri City—Colorado City—Canon City—Progress of Mining Operations—Arastras and Quartz Mills—Consolidated Ditch—Forest Fires—Miner Killed by Indians—Lingering Frontiersmen—Floating Prospectors—Mines and Mine Owners of 1859—Road Construction—South Park Developments—Attacks by Indians—Tragedy of Dead Men's Gulch—General Notes—Mining Terms.

That summer of 1859 was one of untiring activity in and around Denver, and it saw the beginnings of many worthy and important undertakings. From very early in the spring a large number of men had been assembling at Arapahoe, opposite the mouth of Table Mountain, or Clear creek, cañon, a short distance from Golden; and from that assemblage went forth not only the developers of gold mines in the mountains, but the founders of Golden, Idaho, Mountain City, Central City, and other mountain towns in the Clear creek country.

Arapahoe had its beginning in the closing days of 1858, and was then expected to become a town of some importance. Samuel S. Curtis was responsible for it, and of that we have the following from him:

> "I was not in very great favor with the officers of the Denver Town Company during the first two years of its existence. About Christmas [1858] I moved over to and laid out Arapahoe on Vasquez Fork, now Clear creek, just east of the Table Mountains. In February, 1859, I went to the States on horseback with my grub and blankets on the horse, and saw no human being between Fort Lupton and the emigrant crossing of the South Platte, a distance of about two hundred miles. I did not realize it so much at the time, but it was a tough trip. I reached Denver on my return, with a stock of merchandise, on July 3rd, and located my goods at Arapahoe, where quite a number of people were engaged in placer mining, and turning the creek to get down to bed rock, none of which proved profitable. In the fall of 1859 I moved my stock of goods to Auraria, not having been able to secure a satisfactory room on the Denver side of Cherry creek."

Arapahoe in the spring and summer of 1859 accumulated fifty or sixty cabins; then it was suddenly deserted, the abandoned cabins later removed to Golden, and the land used for agriculture.

The Golden Town Company, which was called the "Boston Company" by its originators, was an afterthought on their part. They had encamped at that gateway to the mountains—the mouth of Clear creek cañon, where the trail to the mountain diggings crossed the creek. Continued high water suggested to J. M. Ferrell the need for a bridge there, and its probable value as a business enterprise. He first constructed a foot-bridge, and a little later built a toll-bridge for teams, the first of the kind in this region. He improved the roadway in the vicinity of his bridge and had a property of public utility and private profit.

The number of people gathered there, attracted by the great natural beauties of the locality, or encamped preparatory to entering the mountains, suggested the expediency of laying out a town. For that purpose a company was formed which consisted of David K. Wall, J. M. Ferrell, J. F. Kirby, J. C. Bowles, Mrs. Williams, W. A. H. Loveland, H. J. Carter, Ensign Smith, William Davidson, F. W. Beebee, E. L. Berthoud, Stanton, Clark and Garrison. They selected two sections of land, laying out, early in July, the half of one of them in lots and blocks; the remainder not being surveyed, until the following year. A saw-mill and a shingle-mill, which had just been set up in the adjacent pine woods, supplied material for building, which progressed rapidly, the town having about seven hundred located inhabitants before winter came on it. It was then almost a rival in size and ambitions of Auraria City and Denver City combined.

Golden was named for Thomas Golden, the friend and associate of George A. Jackson. Its pioneer citizens were John W. Ferrell, W. A. H. Loveland, Fox Diefendorf, P. B. Cheney, Dr. I. E. Hardy, George A. Jackson, Charles M. Ferrell, John F. Kirby, T. P. Boyd, William Pollard, James McDonald, George West, Mark Blunt, Charles Pennington, E. B. Smith, J. C. Bowles, David McCleary, I. B. Fitzpatrick, and J. W. McKay. The Rocky Mountain Gold Reporter and Mountain City Herald, of August 8, 1859, said Golden at that date, only one month after it had been surveyed, had fifty houses, one thousand nine hundred and thirty men, and seventy women. This census, after the fashion of some made in our own times by ambitious towns, probably included much of the transient travel to and from the mountains the day it was made. The proportion of people to houses—forty to one—was certainly an uncommonly large one, even if some of them did live in tents. But Golden was a substantial town, and it has never lost that quality.

The first vegetable garden worthy the name in the new country was planted there in the spring of 1859, and before the town was located, by Mr. David K. Wall. In that first year he cultivated two acres, selling the produce to the mining people and receiving some two thousand dollars for the crop. The next year he planted about seven acres, and from the crop realized near eight thousand dollars, so fruitful was the soil. After Mr. Wall grew his first crop, others saw the possibilities of the business, and in the following spring abandoned the hard, wearisome, disappointing occupation of hunting for gold, and turned their attention to small farming and gardening in favorable places along the South Platte near Denver, and on its tributaries nearer the mining towns. In those days all kinds of garden stuff brought extravagant prices that reconciled its producers to an occupation which, if not so feverish and exciting as life in the diggings, was more certain to yield returns that would make the average man of that time better off in both mind and pocket.

First House built in Golden. Erected by the Boston Company in July, 1859. Structure, slightly changed, is still standing and occupied. (From a photograph made in 1860.)

Mr. Wall's California experience had taught him that there were ways of making money in a mining country other than digging it out of the gulches and bars. He had brought with him here a supply of garden and field seeds with some farming implements and garden tools. Of his agricultural operations in the spring of 1859 he says:

> "I cleared, plowed and fenced a few acres of good ground on the site of the valley of Golden. I plowed, planted, and dug a ditch to convey water, this being the first start toward farming and irrigating in this new and fertile soil. My camp proved to be a success, and it gave confidence to others, who came in later, that it was possible to raise good crops in this country. During the latter part of the spring and summer and in the fall I took great interest in my growing crop, and became sanguine as to the promises in this new country. I wrote to my brother what supplies to bring out, which he did with four horses, in the month of October, following, bringing glass not only for our building, but to make hot beds. The following year, in 1860, a larger area was cultivated and a better crop of vegetables was raised. People had flocked in fast in 1859, and that summer a town company was organized, in which I was one of the members, and the town of Golden was laid out."

This pioneer farmer remained at Golden until 1864, when he came to Denver and engaged in plains freighting. In 1871 he quit freighting and invested his capital in Denver real estate and since that time has been a resident of the city.

Golden Gate, two miles north of Golden, where the road from Denver to the Gregory diggings entered the mountains, became a flourishing settlement in a short time. At the mouth of Left Hand creek was another one, called Davenport, which was later abandoned. At Gregory point Mountain City was laid out in May, immediately after Gregory's discovery, and Richard Sopris started building the first house, on the 22nd day of that month. Sopris, with J. H. Gest, was operating the Mammoth Quartz Mining Company, which had acquired thirty claims on that lode within so short a time after its discovery. Black Hawk had early become a mining camp that summer and a close neighbor to Mountain City. Just beyond it, to the northward, Central City was laid out by Harrison G. Otis, Nathaniel Albertson and John Armour, in Kendall Gulch, and was given its name by Mr. W. N. Byers of the Rocky Mountain News at Cherry creek. Central City fast outgrew Mountain City—though they were practically one place—and in 1862 the Post Office Department changed the local post office name to Central City when the latter absorbed the other town and Mountain City disappeared from the map. In 1864 the Territorial Legislature incorporated Central City.

Kendall Gulch was named for Kendall, of Gregory's discovery party. It appears that honors were not equally divided among the members of that famous band of prospectors, for they named the gulch after Kendall, and the hill, or point, after Gregory, but do not seem to have attached the name of Wilkes Defrees to anything of permanent duration. Wilkes was the man who dug the dirt from which Gregory washed the first gold on that memorable 6th of May, and he should have been remembered when names were being affixed to the hills and gulches and creeks in the locality of his profitable shoveling. Other men took care of their fame by doing the naming themselves and for themselves.

"Spanish Bar," on, or in Clear creek, a short distance below the mouth of Fall river was discovered by Andrew Sagendorf and Ransom P. Smith on May 10, 1859, and it developed excellent results. A few days later, and among others, a party of Spaniards, or Mexicans, came in and staked out claims on part of the bar; and it was from their presence and operations that the place received its name.

Up on the headwaters of South Clear creek where he had struck a lode about the first of August, George F. Griffith and others laid out a town which they named Elizabethtown. It grew but little in 1859, as richer discoveries elsewhere soon drew the miners away; and for several years it did not do much better. In 1867 its name was changed to Georgetown, and after the discovery and development of the silver mines its importance was demonstrated and it became a flourishing place, though it is now somewhat in decadence.

On August 8, 1859, Thomas Gibson, previously of the Rocky Mountain News at Auraria-Denver, issued at Mountain City the first number of the newspaper we have elsewhere mentioned, with the imposing name of The Rocky Mountain Gold Reporter and Mountain City Herald. It was printed on the little lever press Jack Merrick had brought to Denver in April of that year, and on which he printed here the first and only issue of his Denver newspaper, the Cherry Creek Pioneer. Gibson, who had bought Merrick's outfit, had taken it to its new field of usefulness. After an existence of about five months the Reporter with the rest of its name, was discontinued there, and its equipment passed to the Boston Company of Golden, Mr. Gibson returning to eastern Nebraska. In the spring of the next year he brought a new newspaper outfit to Denver, and on May 1, 1860, began publishing Denver's first daily paper, the history of which is involved with that of other Denver newspapers given in a succeeding chapter. Gibson's pioneer paper at Mountain City was published in George Aux's log cabin.

Late in 1859 a town was located on the divide between Russell and Spring gulches, and named Missouri City. "Governor" Steele and "Secretary" Bliss, of the "Jefferson" Provisional government, wanted the overland stage and express company to move its offices there from Denver, declaring that it was the only town in the country that would ever amount to anything. But "Missouri City" faded, and soon passed away.

About midsummer a party from Denver and Auraria went down to Pike's Peak to lay out a town near that landmark, among them being M. S. Beach, W. P. McClure, E. P. Stout, Lewis N. Tappan, T. H. Warren, S. W. Wagoner, R. E. Whitsitt, and L. J. Winchester. These men organized the Colorado City Company and made claim to a tract of land containing two sections, or twelve hundred and eighty acres, on which they laid out Colorado City. There is of record one of their deeds dated as early as August 13, 1859, but all their arrangements were not completed, nor did Colorado City stand out full-fledged, until November 1st of that year. The few of the people of "El Paso," of 1858, who had lingered around there, joined the new company and their old town then lost its shadowy identity. Colorado City was never a mining camp, but was intended from the beginning to be a commercial metropolis. Within a year it contained upward of two hundred and fifty people, but on paper it was a city of widespread distances. A solitary traveller passing that way in the summer of 1860, after nightfall was astonished to find his horse stumbling over town-lot stakes, with no sign of a town anywhere visible in the evening gloom. This appears to have been the first application of the name "Colorado" in this region.

In October a small company which included some of those who had established Fontaine City at "the Pueblo" a year before, founded Canon City by building a solitary cabin. These men also located a road up into the diggings at Tarryall that autumn. The next year when the new people began coming to the mountains, many of those following the Arkansas river halted at Canon City on their way into the South Park, and that year really marked the city's beginning, for it was not until then that anything like permanent town improvements were made.

Notwithstanding the founding of towns all 'roundabout, the two at Cherry creek were steadily the headquarters for the miners and the mining country; and most of the controlling agencies that directed new enterprises emanated from them. They were never at any time seriously threatened with loss of their prestige by places which had sprung up around them.

Prospecting the creeks and gulches had continued with great energy, and men swarmed in them like excited colonies of ants over their disturbed hillock homes. A number of discoveries of varying importance were made on the headwaters of Boulder, North Clear creek and South Clear creek. By the close of June upward of two hundred men were working in Illinois and Nevada Gulches, and Missouri Flat, adjacent to Russell and Gregory gulches. They were taking out an average of nine thousand dollars a week. By the close of September there were about nine hundred men at work in Russell Gulch, alone, their weekly production averaging in the neighborhood of thirty-five thousand dollars.

Elsewhere in that general section many other discoveries and developments were made in that historic summer of 1859, and hundreds of men were finding remunerative employment. Deadwood Gulch opened up more favorably, and before autumn came, about three hundred men were working there on an average basis of something like five dollars a day for each. Early in the autumn the water in Boulder creek was flumed in several places, to permit working in the creek's bed, and fair results obtained. At Gold Hill, twelve miles west of Boulder City, where rich quartz veins were found earlier in the year, a large number of men were working, and in the autumn a makeshift quartz mill was set up there. At the Twelve Mile placer diggings on the head of North Clear creek, on Left Hand creek, and on smaller tributaries of the Boulder, many men were toiling industriously in the placers and with fair rewards, these Boulder diggings all ranging from three to five dollars a day to the man. On South Clear creek, from Grass Valley Bar to the forks of the creek, considerable numbers of men were taking out about living wages.

Gulch Placer Mining.

One of the great disadvantages under which many of these pioneers were laboring, was the difficulty in getting water to the mines, for washing. Flumes were built, ditches dug, and even wheels put in the streams to raise the water by the current's power to a level whence it could flow to adjacent workings.

At this time bar mining was also going on in the South Platte river above Denver, on Ralston creek above its mouth, and on Clear creek near Arapahoe. The bar workings never equalled, nor came anywhere near equalling the "mountain diggings," and that summer's ending brought with it the conviction that their ending would not be a great while in coming. This class of work was continued for a couple of years, but many of the places were exhausted to the last dollar's worth this first season, by the swarms of men who turned over nearly every foot of material they contained.

No trustworthy estimate of the total gold product of the region that summer and autumn could ever be formed, but it must have amounted to a large sum, reaching into millions. Many of the miners were reticent about the results of their operations, but when such numbers were securing some gold, all of them put together must have found many hundreds of thousands of dollars' worth.

Early in the proceedings the work of dealing with the partly decomposed quartz was undertaken; and before the summer closed several arastras and a few rude quartz mills were set up and at work in the Gregory District, the arastras uniformly making good profits for their owners; the other mills not being so successful.

An "arastra" was a Mexican contrivance, and an exceedingly primitive one it was, for grinding up quartz. It was a circular tub or trough in the ground, usually ten or twelve feet in diameter, and a couple of feet deep, constructed of stone. In this tub, or trough, heavy stones called "mullers" were dragged around by horse or mule power, over the broken quartz, thus grinding it to powder in the water which covered it, and doing the work fairly well, but with the slowness of the mills of the gods. Those used here in Colorado were usually operated by water power instead of with animals.

The first arastra in the region was an ox-power affair constructed by Lehmer, Laughton & Peck at the Gregory Diggings, near the mouth of Gregory Gulch. They were energetic pioneers in the business, for they began erecting it June 28th, and by the middle of July had it at work grinding quartz in a small way. On July 5th, J. D. Peregrine took in the material for one that was run by water power and set it up at Black Hawk. It was a large affair, the wheel that operated it being sixteen feet in diameter. It began work on August 5th, its large capacity and successful operation making it very profitable to its owner.

On September 17th Prosser, Conklin & Co., who had brought in the first steam stamp mill, got up steam and tried their apparatus. It was a small mill of three stamps, and was set up on Claim No. 1, of the Gregory lode. By the middle of October they had it regularly at work and were doing well with it. On October 7th, Coleman, Le Fevre and Co., started another steam mill, of six stamps. This one was erected in Eureka Gulch, but it broke down soon and was not repaired and put in operation again until November 4th. Late in October a man named Clark took in the third steam mill and had it at work in December.

By October 1st there were five arastras running on North Clear creek and two small wooden stamp-mills, with four more arastras building. All of them were water power affairs, the pioneer ox-power mill having been equipped with a wheel in the meantime. In 1860 stamp-mills arrived by scores and arastras grew in the night.

These small milling concerns that were in operation were realizing about two hundred dollars per week, each, working on the "headings" from the sluices—that is, such quartz as was too coarse to pass through the sluice screens. But Coleman, Le Fevre & Co's. steam mill, when it finally got started with its six stamps, did much better. In its first run, of seven days, it produced one thousand, four hundred and seventy-two pennyweights of gold. At this time they were sixty feet down on the Gunnell lode and the decomposed pyrites was giving way to more solid material. But it paid at the rate of sixty dollars a ton and grew richer the deeper they went. At seventy feet from the surface they realized from fifteen tons, seventeen hundred dollars.

Results approximating these were being duplicated in many other places and the mining community, or that part of which had workable claims, was in a fever of enthusiasm. Preparations were made for building many other mills and arastras, and to most of the claim-owners it seemed that they were just getting ready to mine in earnest.

Immediately after Gregory's discovery and the beginning of active mining, the scarcity of water in all the diggings became a serious hindrance. W. Green Russell, who was naturally much of a leader, saw that something must be done to bring water to the mines. It was decided to bring it from the head of Fall river in a ditch which would be twelve miles long. Russell organized the Fall River Company to dig and own the ditch. Another party, realizing the same necessities, had located a ditch and claimed the Fall river water right. This was the Rocky Mountain Company, of which R. W. Steele, afterward Provisional Governor, was President. The conflicting claims brought the ditch to a standstill for a while, but in a few weeks the two companies united, as the Consolidated Ditch Company, with W. Green Russell as President; A. H. Owens, Secretary; and J. M. Wood, Superintendent. It was made a very expensive undertaking by reason of the high prices for materials and appliances needed. Lumber had to be whip-sawed and carried on the backs of men to the places it was used; powder for blasting cost eighteen dollars per keg; steel was a dollar per pound. The only cheap thing was labor. Hundreds of idle men who had failed to find a place to dig gold were glad to work in the ditch at any wage they could get. It was a large undertaking and was not completed until nearly a year had elapsed. But it was of tremendous advantage when they got it done. In later years when most of the bars and gulches had been worked out, the ditch passed into the hands of alien stockholders, and its mismanagement destroyed its usefulness to the region and its value to its owners.

In June of that summer of 1859 the mining people had their first experience with a great conflagration in the mountain forests of the Rockies. The season was an exceedingly dry one and the accumulation of woodland debris was as inflammable as tinder. The fire swept everything before it on the ranges, from a point forty or fifty miles north of Gregory's to one about an equal distance south, the roaring flames ascending, at times, a hundred feet above the tree-tops, and spreading with the speed of the gale which bore them along.

Many prospectors were scattered through the mountains in the path of the fire, and surrounded and cut off by the flames. How many perished was never known. The first reports made the numbers of dead, six; then the estimate rose to fifteen; then to seventeen; and finally to even greater numbers. The bodies of several, which could not be identified, were found along the more beaten trails after the fires burned out; but how many died in the remoter recesses of the flame-swept area could not be told. There was none to make inquiry or search, and a missing man, if his disappearance were noticed at all, might be thought absent for any one of a great number of common reasons. But there was not one chance in ten that the disappearance of the average man in that throng would have occasioned any comment, unless he went out of the world by personal violence with his fate witnessed by others, or later becoming known.

The first miner killed by Indians in the near vicinity of Denver, was a man named Banker, who was shot by a band of Utes, on Clear creek, early in the summer of 1859. A party of miners pursued the savages, but the latter got across the Snowy Range before they could be overtaken. The miners in the Clear creek districts were not much troubled by the Indians. The region was between the Utes and the Arapahoes, who were hereditary enemies. The Arapahoes in these early years made friends of the miners and the combination deterred the Utes from often crossing the divide after scalps and plunder.

At this time there were still some of the old trappers and mountaineers in this section, following the only kind of life that to them seemed worth living. They formed a sort of caste by themselves, and were inclined to hold aloof from the miners and adventurers that were swarming around them, and whom they regarded as intruders in their wild domain. Some of them were French or French half-breeds, and these looked upon the invading army with the utmost disfavor, as it meant the speedy end of their business, which had already run very low in volume as well as profit.

By the close of the summer of 1859 the discoveries had been numerous enough to give welcome employment to many waiting, anxious men, but there were many more who still could find no claims on which to work. By this time there was a large floating population—if it were not mostly a floating one—with few resources; often, none at all. These were willing to work for day's wages, and for hundreds this had become the sole dependence; but not all, by any means, who so sorely needed it, could find that kind of employment. The construction of the Consolidated Ditch gave work to many, but not to all. A rumor of a new discovery would send the unrewarded prospectors, and the idle but willing laborers, down upon the new locality like a cloud of grasshoppers; and not one in fifty of those who thus went post-haste, would find place to wield his mining tools. Learning that they were too late they would swarm again to some other field which, in turn, they would abandon under similar circumstances. It was a trying, wearing life for the multitude of disappointed men, and sufficient excuse for the majority of them giving it up in mingled disgust and despair, and making their way back to the States as best they could.

Mexican Arastra.

Before the end of that autumn, the established mining districts in the territory of Clear creek and its tributaries were, beside the Gregory, Jackson, Russell, and Spanish Bar, the Central, Enterprise, Eureka, Griffith, Illinois Central, Lake Gulch, and Nevada.

Aside from those otherwise mentioned, the following list embraces the names of the more conspicuous mines and mine-owners in that Clear Creek and Boulder country in the autumn of 1859:

"Alger," by William Alger;
"American Flag,"
"Barrett," by Wesley Barrett;
"Burroughs," by Benj. Burroughs;
"Briggs," by Briggs Brothers;
"Butler," by James D. Wood;
"California," by Hutchinson;
"Connelly & Beverly," by Connelly & Beverly;
"Dean-Casto," by Dean & Casto;
"Gaston," by James Gaston;
"Gunnell," by Harry Gunnell;
"Hill House," by Payne & Co.;
"Leavenworth," by Harsh Brothers;
"Miller," by A. Miller;
"Mack," by W. Mack;
"Missouri,"
"Rhoderick Dhu," by Stevens and Hall;
"Smith," by A. A. Smith;
"Snow," by James Snow;
"St. Louis,"
"Topeka," by Joseph Hunt;
"Tucker," by John Nichols;
"Virginia," by J. Oxley;
"Whiting," by Whiting & Co.;
"Ingles," by Webster & Co.;
"Indiana," by Thomas Brothers;
"Jennings," by Thomas Jennings;
"Kansas," by James Madison;
"Kentucky," by Jones and Hardesty;
"Wood," by Robert Wood.

Nearly all of these claims proved to be real lodes, and were "mountain diggings," in the parlance of that time. Most of them gave a good uniform yield to their owners or operators, though the names of nearly all of them long since disappeared, and but few of the claims are now-existing mines.

While a great amount of gold had been taken from the lodes, gulches, and bars in the six months following Gregory's and Jackson's discoveries, it was not a more potent factor in creating confidence and enthusiasm, than the fair prospect present for obtaining immeasurably more the next season. Owners of lodes were busy getting out gold-bearing material for the expected mills in the following spring, those already in operation being able to handle but a small portion of what was offered them. Tunnels were started in many places by the encouraged miners, but owing to the injudicious locations of most of them, they were of no practical use, and were abandoned in the following spring. They were situated too near the surface, and their projectors had neither experience nor capital to have done better at that time. So, a great deal of labor and money were wasted in these undertakings.

During the summer and autumn of 1859 the beginnings of wagon roads into the mountain camps had been made, partly by applied labor, but chiefly by the wear of travel on the trails. Most of the labor had been involuntarily done in repairing and bettering bad places that were impassable. The roads had become great improvements over the natural conditions in which, at the beginning, twenty yoke of oxen were required to drag a lightly-loaded wagon up the precipitous trails that had done duty as roads. A road from Denver to the South Park was projected, and when the Provisional "Legislature" of "Jefferson Territory" met in November, a charter was granted for it, and it was nearly finished in the following winter. Other road companies were also chartered by the same alleged authority. The St. Vrain, Golden City and Colorado Wagon Road, which avoided Denver, was undertaken; likewise one from Canon City, and another from Colorado City, into the South Park. These roads after their completion greatly facilitated communications, and the transportation of provisions and supplies to the mines, at reduced cost, beside giving evidence of permanence to the occupation of the country.

As prospecting in the summer of 1859 extended over greater areas, a portion of the surplus population flowed across the range and became established on a tributary of the Blue river, where Breckenridge is now located in Summit county. Several hundred men were soon congregated there. Others had made their way into the South Park, drawn thither by the stories of earlier mining in that section. There, on a branch of the South Platte, a miner named W. J. Holman, discovered gold in fine quantities. He called the place "Pound Diggings," so named for his friend David Pound. It was a most enticing name, and soon made a great reputation for the locality; many of the thoughtless, credulous crowd rushing in there, taking it for granted that the name signified that a man could dig out a pound of gold a day as his average production, ignorant or oblivious of the fact now so well established, that Nature does not often bestow such opulence on diggings anywhere.

However, these new mines developed most encouragingly. In one week, Holman, with five men, took out six hundred and eighty-six dollars; the Mountain Union Company, with four men, produced in one week, four hundred and twenty dollars; Bowers & Co., with three men, obtained in one week, nine hundred and sixty-nine dollars—fifty-seven ounces worth seventeen dollars an ounce. In a generosity born of these successful operations, these miners with sudden riches before them, decided to call the camp and the creek on which it was situated, by the hospitable name of Tarryall, thus inviting everybody to stay and share in the wealth, provided it were found outside their claims.

Hundreds soon gathered and tarried there. It was not long before an uproar of wrangling and squabbling over conflicting claims broke out, and which ended, or partly subsided, when a large portion of the tarriers shook the dust of the place from their feet, and put out to find new mines elsewhere; which, to their great delight, they speedily did. It was determined that there should be, in the new district, no just cause for such unseemly dissension as that which had induced them to depart from Tarryall, but that even-handed justice should rule in the new camp. Therefore, to emphasize this praiseworthy decision, the place was named Fairplay, and from that beginning grew the present thrifty county seat of Park county. There are several other stories to account for the name, but they are inaccurate and far-fetched.

During midsummer of 1859 two parties of mountain prospectors were attacked by Ute Indians and several of the white men were killed. Late in July J. L. Shank, J. L. Kennedy, and William M. Slaughter, the latter a prominent pioneer of Denver, were in a gulch just south of Mt. Evans. They were fired upon by the Indians in ambush. The men were separated by some distance; Kennedy was killed, Shank mortally wounded, and Slaughter escaped. Later the bodies of the dead men were recovered. Shank had crawled into a thicket, and had scrawled a note saying that to avoid a lingering death from his wound, and thirst, starvation and exposure, he intended ending his life with his revolver. A bullet hole through his forehead proved that he had done so.

Water-power Arastra.

The other party, consisting of seven men, set out from Tarryall to find a more agreeable abiding place; and about the first of August were waylaid by ambushed Utes while passing down through a gulch on the other side of the divide, toward the San Juan country, and eight of the party were killed. The ninth man was wounded, but escaped and made his way to Denver, and almost immediately left for his former home in the east, half-dazed by his experience and unable to give the names of his companions. Later, the bodies of the six, scalped and mutilated, and surrounded by the carcasses of their pack animals, were found, but could not be identified. A dead Indian lay near them. From these unhappy circumstances the place was called Dead Men's Gulch, a gruesome name it still bears. These were about the only serious troubles the miners had with the Indians until the outbreak of 1864.

Eight miles northwest of Fairplay an important discovery was made late in the summer of 1859 by a party of prospectors headed by Joseph Higginbottom, otherwise "Buckskin Joe." He was a mountaineer whose characteristic dress of tanned deer skin gave him his descriptive appellation. The Buckskin Joe Mining District was established there, and next attracted the dissatisfied, out that way, and the camp became one of great activity. In October, 1860, the town of Buckskin Joe was staked out by Hibbard, Stansell and Dodge. Later they gave it the name of Laurette, and far later, the town of Alma was established near its site. Many of the claims developed with great richness, and the locality became the scene of extraordinary excitement, people flocking there from all parts of the mining region, living in shacks, tents, wagons, and under trees, until the gulch soon contained over two thousand.

Hamilton and Jefferson followed in the South Park the same season, the latter in a short time becoming a camp of several thousand people. Many immigrants arriving in the later half of 1859 by way of the Arkansas river route, went directly into the mining camps in the South Park, and several hundred men wintered there that season. But, of these South Park pioneer "cities," Fairplay was the only one that survived.

Kit Carson who, at this time, was Indian Agent at Taos, New Mexico, and had the Utes under his care, appears to have considered the discoveries of gold in the region bordering on the Ute hunting grounds as of less importance than the consequences they would entail upon his Indian charges. In a report to the Bureau of Indian Affairs, made by him late in the spring of 1859, he says:

"I have been informed that in the Belle Solado gold has been discovered, and that large parties of miners are on their way thither. If such is the case the Utahs will be dissatisfied. The Belle is the only place in their country where game of any consequence can be found, and if the miners and Indians come in contact I fear there will be trouble. The Indians will object to their being in their country and, if able, will drive them thence. The miners in search of gold will resent and, being satisfied that gold is there, will prefer death to returning. If one party is killed a much larger one will return to avenge the death of their comrades. The only hope of saving the Utahs now is to have them settled. The game will shortly be driven from their only hunting grounds, and necessity will compel them to steal, and, if Americans are the losers, the Indians will be pursued and many of them killed. Americans are not a people to apply to government for redress of grievances when they have the requisite force to compel the guilty parties to make the losses good."

The "Belle Solado" referred to by Carson was the locality in the South Park where the salt springs and marshes are. Among the old mountain-men it was known as the Bayou Salado, and it was the resort of the wild animals by thousands.

In a report dated June 8th Carson states that the miners had killed one Ute Indian; and this probably accounts for the revengeful affair of Dead Men's Gulch afterward.

The year 1859 was a dry one, and before the beginning of autumn water was becoming very scarce in all the diggings, and operations on many claims had to be suspended on that account. As the season advanced it became scarcer and work was stopped on many more claims. This was not altogether a hardship on their owners, as a large proportion of the successful ones, elated by what they had accomplished, were anxious to go home and show the results of their labor in the Pike's Peak region, believing that when they came back they would dig out plenty more gold. Then, the great majority of them—nearly all—did not know from experience what the winter might be in the mountains, and had contemplated all along that they would return to their former homes before cold weather set in. So, a great number of the people went back to the States late in the autumn for a winter's visit, with the intention of coming back in the spring, which they did; and with them went hundreds, thousands, who vowed they would never come back; and they did not.

With the returning claim-owners the next year came a new army of the enthusiastic and inexperienced, every individual excited by the stories of 1859, and few of them realizing what was before them. These new comers had to go farther to find working places, and many of them fared badly. The haste, the trials, the ignorance of the previous year were present again, and its scenes were re-enacted by even a greater number of disappointed, dejected souls, who had made their long journey for nothing, except an abundance of exceedingly bitter experience.

Some of the mining terms and phrases were of the mining soil, itself—born of it and the business, or transplanted here from other mining parts. A "gulch" is a ravine without running water except after heavy rainfalls, or at the time of melting snows. Later, the term was often applied to any narrow valley regardless of the presence or absence of a stream. The "color" is simply a trace of gold, and the term was used synonymously with "prospect;" so, "prospecting" was hunting for the "color" or a "prospect." "Grub-staking" a prospector is supplying an impecunious man of experience with provisions, tools and other supplies for an expedition into the mountains, for a share, usually one-half, of whatever of mineral value he may find. Many important mines in Colorado were located by men who were grub-staked when they made the lucky finds. "Jumping" a mining claim —or a town-site—a practice generally out of fashion this long while, was taking possession in the absence of the owner, and without his knowledge or consent, of a claim, or of land. Usually it was done upon assertion or presumption of defect in title arising from alleged technical non-compliance with established regulations; but occasionally it was open usurpation which sometimes led to bloodshed, and the rightful owner was not always able to re-possess himself of his property, though where the pioneer mining laws were in force they carefully guarded against such wrongs.

Aside from the pick and shovel, the pioneer mining appliances were the "pan," the "sluice," the "gold-rocker," and the "tom." The pan was an ordinary block-tin or iron basin holding about a half-peck, and was used by hand; it could have been used for a dish-pan if it were needed for so unusual a purpose, and often was used for a bread-pan. The sluice, for the operations of one or two men, was merely a square wooden box or trough, open at the top and both ends, of any desirable size and length—though the larger and longer the better. It was fixed at an inclination, and through it a constant stream of water was made to flow. Transversely on the bottom of the sluice, inside, cleats or riffles were fixed, retaining quicksilver to catch and hold the gold by its affinity for the yellow metal. The gold-bearing dirt and decomposed quartz were shovelled in, or loosened so the water would carry the material in, and as it was borne down the sluice the gold was disengaged and, falling by its heavy weight to the bottom, united with the quicksilver. In some placer work in the gulches this method was amplified to suit larger operations, and to some of these we will again refer. The rocker was a sort of baby-cradle with two bottoms, the first one being an iron coarse screen, while the lower one held quicksilver after the fashion of the sluice. It was a one-man affair, and the operator placed his rocker near the water, brought his pay dirt to it, put it on the screen, and poured water on the dirt from a cup with one hand, while he rocked the cradle with the other. The gold passed through the screen with the dissolved dirt, and was retained by the quicksilver on the lower bottom. With this simple contrivance many men took out small fortunes in the palmy days of placer mining in Colorado. The rocker, with its small consumption of water, was about the only thing that could be used in winter work, because of the frozen condition of the streams. The tom was a greatly enlarged rocker, working on the same general principles, operated by several men, and usually used in connection with two or three small sluice-boxes, the water being conveyed to it in a continuous stream.

It was with such appliances as these that most of this pioneer gold-mining in this region was done.

CHAPTER XXXI.

Bad Quality of Pioneer Liquor and Its Consequences—Ruffians, Gamblers, and Thieves—Rocky Mountain News—Eastern Newspaper Comment—Denver's First Fourth of July Celebration—Births of White Children—Further Transactions of the Town Companies—Termination of Their Records—General William Larimer—Trouble with William McGaa—Last Echo from "St. Charles"—Other "First-Born" Children—Bridge Building—Mercantile Additions—Prices—John McBroom—First School—First Duel—Another Proposed—First Marriage—Social Gatherings—Pioneer Theatrical Performances—Improvements—Great Mercantile Acquisition—Commercial Profits—Close of 1859—"The Cold Christmas."

All the early theorists, and the practical judges, too, agreed that the whiskey Denver consumed in her youthful days was of an exceeding bad quality. It was colored and otherwise doctored to suit the fiery tastes of various grades of customers, and retailed from bottles bearing popular nick-names; one virgin barrel usually serving as the base of all these operations. The customary retail price in 1859 for all qualities—none of them good—was twenty-five cents a drink. Whiskey was at the bottom of most of the frequent brawls and fights. Considering the common inclination among many who were then here, to use the pistol on slight provocation, the wonder is that the number of homicides was not greater than it was.

One day B. D. Williams, General Manager at Denver of the overland stage and express line, caught a drunken man making off with one of his mules. Williams, instead of having the reckless criminal lynched for the offense—always considered a capital one on the frontier—boarded him a couple of days until he sobered up, and then dismissed him with some good advice. Afterwards he justified this extraordinary leniency on the ground that the whiskey then retailed in Denver would make any man steal.

Among the hangers-on, the flotsam and jetsam of the great incoming tide of humanity, were scores and hundreds who were prone to drinking, sour in temper, and always ready for a fight. They were quick to resent a real or fancied slight, and often started a fracas or committed an outrage in pure wantonness. Many of these gentry, to whom the quality was utterly alien and unknown, were great sticklers for deference to what it pleased them to call their "honor;" and disregard for this imaginary possession, by blunt but decent men, brought on many an affray. The miners and other substantial members of the community, were usually prepared to resist flagrant encroachments upon their rights with a rifle or a revolver, and until a stable form of government was organized, each man had to be always in readiness to act, in a great measure, as his own executive of natural law.

Almost from the first, gamblers and thieves were the pests of the Cherry creek towns. A considerable number of them managed to get across the plains early in 1859; some coming quite early. Usually they arrived without resources of any kind, and in consequence resorted to all sorts of exasperating practices to keep their evil souls from parting company with their worthless bodies. Their outrageous behavior provoked frequent affrays and caused endless friction in the community. After the Clear creek discoveries began to generally yield profitable results, the gamblers and petty swindlers with their games and tricks for fleecing the unwary, seemed to be in a fair way to accumulate riches faster than the hard-working miners who were digging them from the earth. Scores of these harpies infested the towns, not even pretending to have any other occupation than that of plundering the thoughtless and reckless who had gathered up some of the yellow dust; employing means ranging all the way from the alleged "square game," down to bare-faced cheating, swindling and robbing. To this were added the depredations of thieves who stole, right and left, any portable thing on which they could lay their hands in the absence of the owner. These marauders and their gambling associates had been cowed for a season by the summary execution of the murderer Stoefel, but later renewed and continued their practices until the vigilance committees threatened them with the fate that later overtook the more dangerous class of outlaws.

The influence of good newspapers in any community is an element in the development and advancement of a town, a state and a country, that is oftener under-estimated than over-estimated, even if we pause to give careful, thoughtful consideration to it. It is an influence that exerts itself so steadily, so constantly, so persistently, that in becoming accustomed to having it with us and around us, we forget the measures of its benefits, as we grow thoughtless of those of the warm air, of sunshine, and of the dews and rains. It is to be said that none of the agencies at work in laying the foundations of this city and State, were more potent in results, more effective in forwarding and sustaining the welfare of the people, and in leading the way to better material and social conditions, than the Rocky Mountain News. There was something prophetic in the leading editorial article printed in the first issue of the paper, in which the objects of its proprietors in coming here and their faith in what they found here in the new country, were related in these words:

> "Hurrah for the land where the moor and the mountain
> Are sparkling with treasure no language hath told;
> Where the wave of the river and spray of the fountain
> Are bright with the glitter of genuine gold."

> "The Missouri river is no longer the "farthest west" to the ambitious emigrant, but leaping at a bound over 500 miles of solitude the emigrant now settles at the base of the Rocky mountains, and here, even in midwinter, has formed the nucleus of a future state. Spring has scarcely dissipated the dangers of winter travel, and yet thousands are here, many thousands on their way, and even now men ask with avidity for news of the mountain mines. If the richness and extent of the gold region realize their present promise a new state will be organized west of Kansas and Nebraska ere this year is closed, with 100,000 inhabitants. The proprietors of this paper have, until a month past, lived at Omaha, within 500 miles of the gold region, and have had abundant opportunity to judge of the truth or falsity of the testimony daily presented in regard to the gold mines. We think there is more evidence of a reliable character of the richness and extent of these mines, and obtained under far more unfavorable circumstances than was offered from California. The geological structure is the same as in the gold regions of California, and men who are familiar with mining in California have examined these mines west of Kansas and Nebraska as far as the season would permit, and pronounce these of greater promise than any heretofore known. The testimony is absolute as to gold, though it is not absolute as to the richness and extent of the deposit. Believing this, we have, at great trouble brought a printing press and all necessary fixtures over 500 miles at an inclement season and over roads freezing by night and thawing by day. We have done this because we wished to collect and send forth reliable information, because we wished to help mould and organize the new population, and because we thought it would pay."

In those old times when the powers of evil, of disorder, and of confusion became rampant, the News stood out against them like a surge-beaten rock in an angry sea. The Sons of Belial found it their bravest and most dangerous foe, and learned to fear it as they feared no other influence that was raised against them before the People's Courts came out with ropes. It was tireless and sleepless in its warfare against crime, and vice, and wrong, committed by those whose evil natures were encouraged and made daring by the unorganized, governmentless, irresponsible condition in which the people were situated in 1859 and 1860.

Nor was that all. This pioneer newspaper earnestly encouraged the multitude in which hope and despondency so frequently changed places, strengthened faith in the new country, and outlined the possibilities that only required development to become substantial realities. It early directed attention to sources of wealth and prosperity other than those of the mines, and pointed out the endowments which Nature had so generously bestowed upon the region. In one of its issues in the autumn of 1859, when it was barely six months old and the settlements only twelve, the News, in its endeavors to bring the people to a proper realization of the resourceful character of the country, said:

> "No country in the world, in so short a time, has developed so many resources of wealth. Not only the precious minerals, gold and silver, are found, but iron, copper, lead, alum, copperas, cinnabar, and numerous other minerals. We have the finest of building materials, marble, lime-stone, sandstone, brick-clay, and inexhaustible forests of the very best pine timber. Our agricultural products need not be poor in quality, nor small in quantity. Wheat and other small grains can be produced without limit, at less comparative cost and of better quality than in the Northwestern states, and to prove that all kinds of vegetables can be raised to the greatest perfection, one has only to pay a visit to our vegetable market."

The News never wavered in its faith, even when hundreds and thousands of disappointed would-be miners were flocking back eastward late in the summer of 1859, berating the Denver region as "a fraud and humbug," because they had not found gold nuggets lying around loose in the streets of the towns, and waiting to be gathered up in bags and baskets. The newspapers of the then frontier States made themselves merry over conditions they attributed to this region; and the Davenport, Iowa, Gazette, thus expressed its opinion of the accounts the News was publishing about them:

> "The Cherry Creek Rocky Mountain News comes to us printed on brown wrapping paper. The editor has evidently lied his paper black in the face. This number teems with glorious news about new discoveries of gold, and says the town is half deserted. So we heard, but not from that cause. It is all humbug."

Another border newspaper fabrication, amusing in its way, and intended as a burlesque on the gold discoveries out here, made the editorial circuit of the States and entertained many readers. It was like this:

> "It is said that a man takes a frame-work of heavy timber, built like a stone-boat, the bottom of which is composed of iron rasps. The frame-work is hoisted to the top of Pike's Peak, and a man gets on and slides down the mountain. As he goes down swiftly, the rasps on the bottom of the frame-work scrape off the gold in immense shavings, which curl up on to the machine; and by the time the man gets to the bottom a ton of gold, more or less, is following him. This is the common manner of gathering it."

The patriotic instincts and feelings of the people were not overwhelmed and buried by the excitement over the rich discoveries of gold on Clear creek, and the Fourth of July, 1859, was duly celebrated at Cherry creek. The day was generally regarded then with more veneration than it is now, or with more popular manifestations of it. At that time there was a considerable growth of timber at the mouth of the creek; and in the grove on the Auraria side the celebration was held. The Declaration of Independence was read by Dr. J. M. Fox, local agent for the stage company, and this was followed by an old-fashioned, spread-eagle oration, by James R. Shaffer, abounding with patriotism, and overflowing with predictions of the future greatness of this western country. But in his wildest flights of oratory—and practically no limit was placed on Fourth of July oratory in those days—Mr. Shaffer did not verbally picture anything seeming so extraordinary and improbable, as the sober facts with which we are now so familiar. A party coming from Omaha had brought with it the instruments of a brass band and knew how to use them; and these men enlivened the proceedings with the inspiring strains of "Hail, Columbia," the "Star Spangled Banner," "Yankee Doodle," and other melodies believed to be appropriate to a celebration of Freedom's birth-day.

Another notable incident happened in the Cherry creek settlements in this month of July; the birth of the first child (a girl) of full-white parentage. She was the daughter of Henry and Rosa Humbell who lived in Auraria; and her birth balanced matters of that kind between that metropolis and the one on the eastward side of the creek which had been taking on great airs because of its production of the junior McGaa in the previous March. Mr. and Mrs. Humbell had come here from Utah, by way of Bridger Pass, early in the spring of 1859. Humbell rented the cabin on the southeast corner of Tenth and Larimer streets, that had been Smoke's "El Dorado Hotel," where he started a bakery and employed as baker John Milheim, now and ever since that time, a well-known citizen of Denver. Mr. Milheim had come to Denver that spring from Omaha, and soon after his arrival engaged with Humbell as a baker. He remained with him until the first of the following August, and boarded at Humbell's cabin; the birth of the young lady having occurred about two weeks before he quit working there. But she was not the cause of Mr. Milheim's departure. He quit Humbell on August 1st to go into partnership in "Denver City," in the bakery business, with John J. Riethmann. Milheim, a baker by trade, had brought with him an outfit of baking pans and other appliances, with the expectation of engaging in the business, and early in that month he and Riethmann started the "Empire Bakery."

Mr. and Mrs. Humbell named their daughter "Auraria," in honor of her birth-place. They remained here until 1863 when they went back to the Reese river country which had then become part of Nevada. The elated Directors of the Auraria Town Company in their zealous pride in the birth of the first white child at the mouth of Cherry creek, donated a town lot to Miss Auraria, and three more to her parents. The deed for Auraria's lot was made directly to the child, is of record in old Book D, page 23, Arapahoe County Records of Deeds, now in the office of the Clerk and Recorder of Arapahoe county, and reads as follows:

Auraria Town Co
To
Auraria Humbell } Know all men by these presents that for and in consideration of the sum of One Dollar to them in hand paid, the receipt whereof is hereby acknowledged, the Auraria Town Company, by its officers duly empowered, have sold and by these presents do sell and quit-claim unto Auraria Humbell, her heirs and assigns, the following described property situate in the City of Auraria, Kansas Ter., to-wit: Lot number one (1) in Block no. Sixty-seven (67).

In testimony where of witness our hands and seals this 22nd day of October, 1859.

William McFadding, Pres't
John J. Shanley, Acting Sec'y.

Henry Humbell duly received deeds for the three lots given him as a bounty, the nominal consideration for each conveyance having been one dollar. The first, made December, 27, 1859, was for lot number two, block number eleven, and is of record in Book D, page 21. The second was given him January 5, 1860, for lots seven and eight, block thirty-one, and is of record in Book D, page 22. Both deeds were signed by A. C. Hunt, Vice President; and Andrew Sagendorf, Secretary. These two, and Auraria Humbell's, deeds were filed for record on January 9, 1860.

There have been many conflicting statements promulgated concerning the "first white child," and the "first" girl born in Denver. The circumstance of John Milheim's employment in the house in which and when Auraria Humbell was born; the action of the Auraria Town Company in making these gifts of lots to the first white child and her parents; and the written evidence we found in the old records now in the Court House and which may not be questioned, certainly and finally settle this long and much disputed question.

In many previous accounts the dates of the birth of the "first girl" have ranged all the way from September, 1859, to October, 1860. In some of them there are confused traditions of the birth of Auraria Humbell, in which the family name is given as Hubbell, and as Hummell. A man and wife named Hummell lived in Auraria that summer, but that couple did not attain the distinction reached by Mr. and Mrs. Humbell who, Mr. Milheim says, greatly prided themselves upon being the parents of the first white child and girl born in the new city. Mrs. H. Murat, now at Palmer Lake, and who was familiar with the Humbells, corroborates Mr. Milheim's statements. We were unable to ascertain anything of the present whereabouts of Auraria Humbell or of her parents, if they be still living. Humbell was between thirty-five and forty years old, and his wife but little younger, when their daughter was born.

John Denver Stout.

The third child born at Cherry creek, and the first boy of white parentage on both sides, appears, beyond reasonable doubt, to have been the son of D. D. Stout, a brother of the first President of the Denver Town Company. This boy came into the world on August 30th, 1859, "at six o'clock in the morning," and was named John Denver Stout. He is now a citizen of Columbus, Ohio, and is known as Denver Stout. The father then kept a "day boarding house" in E. P. Stout's cabin that stood on part of the site of the City Hall, and is now a business man in Dayton, Ohio. In a letter to us he said that he hauled to Denver for E. P. Stout the first load of doors, sash and window glass brought to this city. D. D. Stout also stated that he did not long remain in Denver, but returned east with his wife and babe in the autumn of that year. The incident of this birth is involved in some additional records of Cherry creek pioneer babies that will appear a few pages further along.

Mr. Charles G. Chever, of Salem, Massachusetts, and who was one of Denver's prominent pioneers, wrote us the substance of a conversation on this pioneer-baby subject he had with the late Captain Richard Sopris, a few years before the latter's death. Captain Sopris related that in the summer or early in the autumn of 1859, a man named Fitzgerald or Fitzpatrick, thought to have been a gambler, and a woman assumed to have been his wife, arrived in Denver, traveling in a wagon on their way from Salt Lake City to the Missouri river. During their temporary sojourn here the woman gave birth to a child—sex not known—in a cabin on lower Eleventh street. Their stay was so short that Captain Sopris did not make their acquaintance, and he believed that necessity, only, forced a brief halt in their journey from Utah to the east. Captain Sopris could give no dates nor was he positive which of the two names the man bore. It would seem that this case was one to which Denver could lay no claims, and that a baby born under such circumstances could not and would not be counted.

The Directors of the Town Companies were not doing much business in this period; at any rate they did not record a great deal, and little of which they made account was of much importance.

On May 27th the Auraria Directors voted themselves for services rendered, "at least one original share," those participating in this dividend having been, according to the record, William McFadding, J. H. Dudley, L. J. Russell, H. Allen, and Thomas Pollock. On July 31st H. Allen was donated four more shares as compensation for general services he had rendered.

During these times they had made many additional donations. To Broadwell, Fisher, and Baker, one share each; to John Hughes, Frank R. Edwards, Mrs. Richards, Judge S. W. Wagoner and Dr. Wilcox, one share each; to William Chase, Pinkley Farr, and A. L. Perkins, one lot each; to D. C. Oakes four shares; to J. K. Elder, S. L. Inslee, Dr. Rider, Dr. W. Stout and Dr. Samuel Reed, one share each; to L. W. Babbitt, Pierson, Hatch, Yost and Villard four lots each. Later they donated Villard three full shares in addition to these lots, and Fred Z. Salomon was given upon his arrival two lots "on condition that he locate his store in Auraria."

On July 8, 1859, the Directors declared forfeited all shares and lots in Auraria, the holders of which had failed to comply with the company's requirements; and on July 31st appointed a committee of three to sell such lots for the Company's benefit, but instructed the committee to sell none for less than ten dollars.

The Aurarians did not make many assessments on lot owners. The first one, "for general purposes," was a levy of fifty cents on each lot, made in April, 1859; the other for that year was one of fifty cents on each lot, made in August, "to defray the expenses of surveying."

The executive organization of the Auraria Town Company underwent several changes during the last twelve months of its recorded existence. On August 12, 1859, Dr. L. J. Russell resigned as Secretary, and John J. Shanley was appointed, pro tem, in his place. On October 12, Judson H. Dudley resigned as Vice President and was succeeded by William M. Slaughter. Colonel Dudley, it may be remarked here, was a native of New York State (April 8, 1834). Though long engaged in mining elsewhere in Colorado, he remained a citizen of Denver until his death on February 13, 1900. Slaughter served as Vice President but two or three weeks when A. C. Hunt was chosen in his stead, though the record contains no direct mention of this change. Hunt, as our reader will have seen, was another of our active pioneer leaders. Born in New York State in 1826, he came to Denver in June, 1859, and was at once recognized as a man of force. Later he interested himself in Territorial politics and in 1867 was appointed Governor of the Territory. He participated in the conception and construction of the earlier lines of the Denver & Rio Grande railroad, and remained a citizen of Denver until 1886 when he became interested in building the Mexican Central railroad and removed to Laredo, Texas. In 1892 he established his home in Washington City where he died May 14, 1894.

On December 13th, "citizens petitioned Board to call an election for President, Secretary, Treasurer and one Director." The Board did so, and on December 17th Thomas Pollock was elected Treasurer and Charles Johnson Director; there being no choice for President and Secretary. On December 24th, William McFadding was re-elected President, and Andrew Sagendorf Secretary. At this time the by-laws were changed so as to make a majority of votes cast sufficient to elect officers.

On December 27th the new organization ordered all lot donations stopped until further action by the Board, and instructed the Secretary to "make no deeds for donated lots not already selected." At the same time a general meeting of stockholders was called for December 28th "to consider matters of importance to the interests of the Company." But few came to the meeting and it was, therefore, postponed until January 4, 1860. This one also failed to be attended by a quorum, and that was the last of the matter. President McFadding died in January, 1860, and on February 4th Charles L. Dahler was elected his successor.

The transactions of the Board appear to have now been reduced to few and mostly unimportant matters; and dissension and loss of interest in the enterprise is manifest in the record. A committee was appointed by the new administration "to investigate the proceedings of the Auraria Town Boards," but if anything came of it it was not deemed of sufficient importance to be put on record. Some accounts of other transactions of the Auraria Board during these months appear elsewhere. The record terminates abruptly with the unsigned entry of May 5, 1860, relative to rewarding E. Karczewsky for bridging the South Platte.

A. C. Hunt.
(Photographed 1864.)

The financial transactions of the Auraria Town Company, so far as they are recorded, were not on a very large scale. The "City Warrant Account" in the record is in the neat handwriting of Judson H. Dudley. Nearly all the "warrants" issued were to Surveyor Foster, and they were in small amounts. The number recorded is fifty-eight, dating from December 7, 1858 to August 11, 1859, when entries in the account ceased. With one exception they were for amounts ranging from two dollars to twelve dollars and fifty cents; the exception having been one to William J. Parish for thirty three dollars and fifty cents. Nineteen of the "warrants," beginning with Number 1, and amounting to one hundred and thirty dollars, were issued to Foster; twelve of them for five dollars each and seven for ten dollars each. All of the larger ones and five of the smaller are recorded as having been "redeemed" at various times in the spring of 1859, but the fate of the other small ones, including Number 1, is not told.

The Denver City Organization possessed greater vitality than that of the Aurarians, and the record extends over a period about one year longer. At this juncture, however, we will only consider the transactions in 1859 occurring subsequent to the 1st of May.

On May 8th the Denver City Directors resolved "that the Town Company donate to Gov. Beall, E. A. Allen and Dr. Belt each ten lots in Denver City." "Gov." Beall was Samuel W. Beall who had come here from Wisconsin, and had been Lieutenant-Governor of that State from January, 1850, to January, 1852. He was faring well in donations, for the Aurarians had given him four shares, or sixteen lots, in their town. It was at this meeting, the patience of the Denver City Directors with Surveyors Curtis & Lowrey having become quite exhausted, that it was resolved "to invite proposals from the different Surveyors for surveying the City of Denver at as early a day as practicable," and the Secretary was instructed to "issue notices" to that effect. This resulted in contracting with E. D. Boyd on June 6th to survey all the land claimed for the town site. Accounts of certain special transactions about this time, such as the efforts to have a newspaper established in Denver City, and to have the South Platte bridged, appear elsewhere.

An example of the way they dealt with neglectful or insubordinate stockholders is afforded by the action of the Denver Directors on August 8th when, "on motion, Messrs. Hemingway, Brindle, Stevens, Walsh and Mitchell, were voted out of the Company for non-compliance with terms." Brindle and Hemingway were later reinstated but, not behaving well, were again cast out. Then the expelled quintette raised a rumpus and the Directors hired a lawyer.

At this meeting of August 8th, William Hartley, Jr., and William Smith, of the St. Charles Town Company, who had not been provided for under the contract between the Leavenworth town-site "jumpers" and Charles Nichols, were offered some consolation by the following somewhat ambiguous action of the Denver City Directors:

"On motion, voted to donate to Messrs. Wm. Hartley, Jr., & Wm. Smith equal to original shares in compliance with the constitution."

We have already stated that the original directing organization of the Auraria Town Company began breaking up in the spring and summer of 1859, and by the end of that year the process had been about completed. The Denver City organization now followed the Auraria example.

The Denver Directors met on September 24th and elected E. D. Boyd "Engineer of Denver City," and transacted some other business including payment of one hundred dollars to General William Larimer, Jr., "for services rendered the Company." At the close of that meeting E. P. Stout tendered his resignation as President. At the next meeting, October 4th, Stout's resignation was accepted, and R. E. Whitsitt elected to succeed him. General Larimer then tendered his resignation as Secretary and Treasurer, and Whitsitt was elected his successor in both positions, making the new President the holder of these three offices, beside those of Recorder and Donating Agent. The Directors voted their thanks to Larimer for his arduous services to the Town Company, and then appointed a committee to investigate his accounts which, of course, were found correct in every particular.

Of General Larimer, whose name and memory are so intimately associated with the settlement of Denver and Colorado, some personal history has already been given. He was a leader among Denver's pioneers, and is a commanding figure in Colorado's early history. He was a frank, considerate, generous man who made many friends, and was very popular here with every one. He actively participated in the movements to establish responsible government in this region, and there was a strong local sentiment in favor of having him appointed first Governor of Colorado Territory, which was cordially supported by many men prominent at Washington; but it was unable to overcome the influences favorable to Gilpin. General Larimer bore an active part in recruiting men for the Colorado Union regiments at the outbreak of the civil war, and was appointed Colonel of the Third Colorado; but, as that embryo organization was merged into the Second Colorado, his commission did not take him into active service. He and his son William H. H., went back to eastern Kansas in 1864, terminating their citizenship in Denver. General Larimer then recruited an Union regiment in eastern Kansas which he commanded as Colonel until the close of the war. Later he purchased a farm near Leavenworth on which he located and where he died May 16, 1875. The name of one of our great thoroughfares daily recalls his own to our citizens, which also designates one of the finest of Colorado's agricultural counties.

Through that summer of 1859 trouble with William McGaa had been brewing over his claims to certain lands included in the "Denver City" townsite, and because of his failure to properly improve lots to which he was entitled as an original shareholder, and those later donated to him. McGaa had promised more than he could perform, was a troublesome customer to manage, and a hard man to browbeat. The difficulties with him culminated on October 15th when the Denver Directors arbitrarily resolved "that the Company retain all lots belonging to McGaa until the matters in dispute be finally settled."

The "matters in dispute" were never "finally settled" with McGaa who, it would seem, was the victim of rather high-handed proceedings, considering that others who were as derelict as he, but in all probability far less aggressive, escaped having their lots confiscated "by the Company." McGaa persisted in his efforts to "retain" all his lots himself until his death several years later; and his descendants still assert their "legal right" to them. They tell of men coming to his widow several times a year, up to the time of her death, "with papers for her to sign," promising her considerable sums of money if she would sign them, which the same, they say, she would not do. However, these matters are not very portentious clouds on present titles.

At this juncture was heard what appears to have been the last echo from the old "St. Charles" undertaking. Some of its projectors after the meeting of October 24th, at which Adnah French resigned as its President and John A. Churchill was elected to succeed him, endeavored to resuscitate that company's "rights," and were talking about the "defects" in "Denver City" lot titles. Therefore, on October 17th the Denver Town Company's Directors

> "Resolved, that no more certificates of Stock be issued until agreement be signed by the members of the St. Charles Town Company, said agreement by request of the Board shall be drawn up by H. P. A. Smith."

Judge Smith's agreement appears to have made things satisfactory to the "St. Charles" men, for with the foregoing entry all record of their grievances is ended.

Notwithstanding their rupture with McGaa, the Denver Directors put themselves on record in favor of an endowment for his infant son and at the same time for one for the child of another progressive citizen. On November 5, 1859, they resolved "to donate 2 select lots to the Child of Mr. Dolman & also 2 select lots to William McGaa's child, Denver." This quotation is all there is of the record entry. The reason for the donation to the McGaa child is apparent, because he was undisputably the "first-born" of the Cherry creek towns. The donation to "Mr. Dolman's child" raised the presumption that we had encountered still another "first child" proposition; and so it turned out to be. We ascertained that Samuel Dolman had been one of Denver's pioneers, but had left the city many years ago. We finally learned that he was living at North Topeka, Kansas, and received from him a communication in which he said:

> "Richard Denver Dolman, my son, was born October 25, 1859, on Lawrence street, between Fourteenth and Fifteenth streets, in the first frame house built in that locality. He was named for Richard Whitsitt and the city of Denver. The Denver Town Company gave me two lots in consideration of having had the first white boy born in the city. My son, Richard Denver Dolman, is now living in Topeka."

Mr. Dolman incidentally remarked that he "took Mr. Whitsitt and his second, Mr. Lawrence, out to the ground in my spring wagon when Whitsitt fought the duel with W. P. McClure."

A search through the old records at the Court House revealed several transactions in real estate to which Samuel Dolman was a party, but none that could be identified as the transfer of the two gift lots; though there are a couple of entries that merely "certified" by the Town Company's officers that Samuel Dolman was the owner of such and such lots. It was so, also, with the case of "William McGaa's child." There are many entries in the old records of William McGaa's real estate transactions, several of which are mere "certifications" of McGaa's ownership, and among these may have figured the two lots given his child. These cases are quite different of record from that of Auraria Humbell, in which the regular form of deed was given directly to her.

The conflict between the claims of "Mr. Dolman's child" and those of the son of D. D. Stout, as to priority of appearance at Cherry creek, precipitated by the action of the Denver Town Company, was referred to E. P. Stout, at Cincinnati, for settlement; the file of the Rocky Mountain News for 1859 and other sources of information having failed to be of assistance. Mr. Stout said:

> "I know positively that John Denver Stout, born August 30, 1859, was the first white boy born in Denver, and the first white child born on the "Denver City" side of Cherry creek; and that the date, as above, given you by his father is absolutely correct. I can account for the donation made to the child of Mr. Dolman. D. D. Stout and family left Denver early in October for the States, and when the Dolman child was born the Stout child was not there; so, the Dolman child was the "first" white one remaining in "Denver City" at the time of the donation. If you deem it of particular consequence, I can find other parties who can verify these statements, and some written evidence of their correctness."

But, as the case had gone far enough, and the "first child" tangle had seemed to have been pretty fairly straightened out, we concluded further evidence would be unnecessary, and that the rightful claims of the really first-born girl and boys were in shape to be finally and conclusively recognized. Therefore, with a few words more we are done with the subject.

A conspicuous "first-born" white claimant on the "Denver City" side was the son of Samuel Howe, Sheriff of Arapahoe county in the early times, and who, at the expiration of his term, left Denver with his family and located in Montana. Charles G. Chever thought this child was born in December, 1859; and says he was given a name pronounced like "Eva." Eva got no donation of town-lots. There were, and still are, many other claimants of both sexes, the birth-dates as given us ranging through 1860 to October of that year.

Births of both sexes were not uncommon events here in 1860; there were several of them, and if the children failed to get lot-donations they were not very much the worse off. Neither of the three children shown by the records to have been thus endowed profited to any extent by the gifts. William Denver McGaa declares that he was never benefited by the action of the Denver Town Company's Directors; and asserts, on the other hand, that lots he should have inherited from his father were later taken from him. When he had become a young man he visited Denver with the expectation that he might recover his endowment lots, and some of the many others once claimed and held by his father. But intervening operations of various kinds and qualities, before and after legislation affecting titles, rendered most unpromising any serious attempts in that direction.

The town companies' records for the remainder of the year 1859 contain nothing of noteworthy interest. The importance and authority of the officers of both companies had been waning as the prospects became better for the establishment of the "City Government" which came into existence in the last month of that year under the act of the "Jefferson Territorial Legislature" consolidating the Cherry creek towns into one municipality.

The Denver City managers made heavier assessments on lot owners than did the Aurarians. The first, on November 22, 1858, was of one dollar and fifty cents on each share; the second, December 29th, two dollars per share; the third, January 29, 1859, five dollars and fifty cents per share; the fourth, in August, 1859, twenty-five dollars per share. About thirty shares, in addition to the nine owned by the Leavenworth & Pike's Peak Express Company, paid the fourth assessment. On September 24th the fifth assessment, of fifty cents, was made. This was "on all donated lots inside the 320 acres first surveyed; to pay for lithographing the town plat, and for building a bridge across the South Platte River."

The managers of both towns gave a great deal of attention to bridge-building, mostly on paper and usually without results. There was almost endless talk about it in 1859, and many propositions were made. The first was that of General Larimer who, on January 22, 1859, in consideration of a liberal subsidy of town lots, proposed to the Denver Directors to build a bridge across the South Platte, with a dam between the piers to hold water for running a grist mill. His proposition in full, and the fate of the enterprise, are stated in the chapter of this work dealing with our manufacturing interests.

On July 11th, 1859, the Directors of the Denver Company resolved "that a called meeting of the Company be called to meet to-morrow at 4 P. M. to take into consideration the construction of a free bridge." When tomorrow came nothing was done, for the record says there was "no coram."

On September 6, 1859, the Auraria Directors proposed the first bridge over Cherry creek, between the two towns. Ordinarily there was little trouble in crossing the often dry bed of that stream, but at other times a bridge was needed. The Auraria action was as follows:

> "Resolved, That the Auraria Town Company will defray one-half the expense of a bridge across Cherry Creek, at the junction of Larimer street in Denver and 5th street in Auraria, provided the Denver City Co. defray the remaining half. Said bridge to be built upon a plan hereafter to be agreed upon by the two towns."

This proposition led to the later construction of the suggested bridge on the plan indicated in the Auraria resolution.

On September 24, 1859, Thomas J. Bayaud proposed to the Denver Directors to bridge the South Platte at or near the foot of Fifteenth street, and a committee was appointed to confer with him. On October 15th a contract was made with Bayaud, who was to receive two thousand, five hundred dollars for the bridge, and R. E. Whitsitt and C. H. Blake were appointed a committee "to see the contract faithfully executed."

About the middle of January, 1860, E. Karczewsky built a bridge across the South Platte, from Auraria. It was at the foot of Eleventh street, was completed after three weeks' labor, and was a business enterprise of its builder. But the Auraria Directors afterward showed a willingness to reward him with some town lots, as indicated in a resolution of theirs which we will presently quote.

On March 8, 1860, the Auraria Directors donated A. C. Hunt sixteen lots "for building a bridge across Cherry Creek at its junction with Jefferson Avenue."

In the spring of 1860 H. B. Chubbuck and Jacob Smith built a bridge across the Platte from Auraria, at the west end of Larimer street. It was not a very substantial affair, but the Auraria Directors took it off the builders' hands on April 21st, giving them "60 lots at $10 each," for it. On the same day those Directors adopted the following:

> "Resolved, That $100 and Block No. 113 be donated for the purpose of erecting a full double-track bridge across the S. P. River at the foot of St. Louis street, on condition that the bridge be commenced by or before the 10th day of May, 1860."

This proposition did not avail anything and the bridge was not built. On May 5, 1860, the Auraria Directors met and took action as recorded in the following:

"On motion of A. C. Hunt, Resolved, that Block No. 108 be hereby donated to E. Karczewsky, he having built a fine bridge across the Platte river at the foot of Ferry street, and that a deed for the same be issued at the earliest convenience, unless the company refuses to recognize this act of the board."

This entry, which is unsigned, with its curious provisional clause at the end, is the last one in the Auraria Town Company's old minute book; so the old record fails to tell us by authority how the company later received the Directors' proposition to reward Karczewsky for building the bridge. With that entry the history of the Auraria Town Company, as recorded by its officers, abruptly terminated.

An old picture entitled "Early Days in Denver, (1859)." The "East Denver" High School stands in or near the foreground of the view

In August, 1859, there were two notable additions to the mercantile community at the mouth of Cherry creek. In that month J. B. Doyle and Fred. Z. Salomon brought in from the south what was for that time an immense stock of goods, their train consisting of twelve wagons each drawn by five yoke of oxen, and loaded to their utmost capacity with groceries, provisions, boots and shoes for men, dry goods, miners' tools and supplies, and so forth. Doyle was an extensive trader in New Mexico, and this train was part of a much larger one he had brought out from the Missouri river that summer. Down on the Arkansas the main train was divided and part sent to Denver in charge of Salomon who had come west with Doyle at that time as clerk and assistant, from St. Louis. Doyle had also brought with him that trip, from St. Louis, O. J. Goldrick, who came to Denver with Salomon, although he had started to go to Doyle's home ranche in New Mexico, which had formerly been the old United States military post, Fort Barclay, to act as tutor for the trader's children. When Doyle decided to divide his train of goods and send part of it to Denver, he made Salomon his partner under the firm name of J. B. Doyle & Co. Soon after his arrival here Salomon built a two-story frame building on Eleventh street on part of the ground now occupied by the Lindell Hotel, and opened his stock in it. Subsequently the firm built a large brick building on the northwest corner of Larimer and Eleventh streets which, in later years was converted to hotel purposes and is now the Lindell Hotel. Doyle did not become a citizen of Denver; but Salomon remained one until his death a few years ago, and was identified with many public enterprises for the development and upbuilding of the city.

The other establishment was that of St. Vrain & St. James, who also came from New Mexico, almost on the heels of Doyle and Salomon, with a long caravan of wagons laden with merchandise, including a large quantity of flour. When they arrived the towns were out of that commodity, and they reaped a harvest. Ceran St. Vrain was, as the reader will recall, an old-time frontier trader in this region, and one of the builders of Fort St. Vrain. This firm located in Denver City on the north side of Market street between Fourteenth and Fifteenth streets and near to Fourteenth, and had in its stock some shoes for women and children, the first brought to Denver for sale; but there were not a great many customers here for them at that time.

In that summer and autumn an active rivalry for trade existed between the merchants of the two towns, and for a while those of Auraria had a decided advantage over their Denver City brethren.

In the autumn of 1859 flour sold in Denver at forty dollars a barrel of one hundred and ninety-six pounds; bacon fifty to sixty cents a pound; beans sixty to seventy-five cents a quart; sugar, fifty cents a pound; milk fifty to sixty cents a quart when it could be obtained; coffee ninety cents to a dollar a pound; eggs, in small quantities, two dollars a dozen; tobacco two dollars a pound; whiskey, with no guarantee as to quality, ten to twelve dollars a gallon. These were the necessities of life. Luxuries, which were in small quantities wherever they happened to exist, commanded almost any price asked if the prospective customer had the disposition to buy and money enough with him to pay it. Feed for horses and cattle was high and scarce. Corn sold at four dollars per bushel; there was little or no oats, and no hay. The stock had to depend on grazing, and the grass had been devoured in the vicinity of the towns and camps by the thousands of draft animals coming in during the previous spring and summer.

One man who settled on a ranche near Denver in the summer of 1859 lived on it continuously for more than thirty years. He was John McBroom, who accompanied Captain Marcy's command in the capacity of wagon-master, when it passed through here in May, 1858. McBroom located on Bear creek, just southwest of Denver, and built a log cabin there which is still standing about a half-mile south of the Loretto Academy, and which became a favorite stopping place for the old frontiersmen who were then left in the country. Kit Carson, Colonel Boone—a grandson of Daniel Boone, Tom Tobin, Jim Bridger, Jim Baker, Tom Boggs and other noted Indian fighters were often sheltered under the roof of that old cabin. McBroom came to the frontier with Doniphan's command during the war with Mexico, and participated in the suppression of the subsequent insurrection at Taos. Late in his life he built a brick dwelling on his ranche near his old cabin, and in which he died in 1891.

Some of the new citizens of the towns had brought children with them across the plains in the spring and summer of 1859, and soon after Goldrick's arrival—he having been a school-teacher in Ohio—he began preparations for opening a school. This he succeeded in doing on October 3rd, in a log cabin in Auraria. Some further particulars of his school appear in another part of this volume.

On the 19th of October in that exceedingly lively year of 1859, Denver City and Auraria had an entirely new kind of sensation that stirred Cherry creek society from its center to its circumference. This was a duel between R. E. Whitsitt and W. P. McClure. Accumulated disagreements, some of which were political, culminated in McClure challenging Whitsitt. The latter rose to the emergency as promptly as he had in that of establishing Denver City on the site of "St. Charles," nearly a year before, and immediately accepted the challenge. They went out of town to fight the battle, the meeting taking place on the east side of Cherry creek just below the point where Broadway now crosses that stream, in the presence of about two hundred spectators. The weapons used were Colt's revolvers at ten paces and at the first fire McClure was hit in the abdomen but not dangerously wounded. This terminated the duel, which was the first in the history of the new country. McClure soon recovered from his injury, and the next year was appointed from Washington the first Postmaster for "Denver City." The "Sheriff" had tried to prevent the encounter, but his authority was not recognized.

Another duel was proposed soon after the Whitsitt-McClure affair. The Rocky Mountain News had published a list of delinquent debtors, in it appearing the name of an alleged friend of Thomas Warren, the pioneer ferryman and brick maker. Warren took offense at this and challenged Mr. Byers. During those times William N. Byers was an oft-threatened man, and upon more than one occasion had been promised assassination and the destruction of his newspaper and other property, by the vicious element on which he made relentless war. His physical courage was unquestioned, and his moral courage was equally great. His public reply to the Warren challenge effectively disposed of that method of attack. He said:

> "To any who may feel like calling us out, we have only to remark that you are wasting your time in sending us challenges or other belligerent epistles. You may murder us, but never on the so-called field of honor, under the dignified name of a duel."

The announcement of the first marriage in the Cherry creek towns, and the first in the Pike's Peak region, was published in the issue of the Rocky Mountain News of October 20, 1859. It was that of John B. Atkins of Mt. Clemens, Michigan, and Miss Lydia R., eldest daughter of Henry Allen, of Auraria City. The wedding took place at the home of the bride's parents in Auraria on October 16th, the Rev. G. W. Fisher being the officiating clergyman.

Life in the two towns in 1859 was not entirely subordinated to selfishness and gain, for there was a pleasant social side to it, even if Hospitality's resources and accommodations were limited. While the Rocky Mountain News never dreamed of "running a 'society' page," there were many social gatherings of bright and congenial people. Furthermore, there were frequent informal assemblages of members of the Masonic order, a society that was proportionately uncommonly strong in membership here in those days. For reasons that were obvious in those times, luxuries were few, and at every social assemblage for which the board was spread—and this implies nearly all of them—dried-apple pies were the dainties of the feasts. Mr. Byers relates that upon one occasion a citizen weary of their inevitable appearance, at last exclaimed: "Damn a country where dried-apple pies are a luxury!"

On October 24, 1859, the first theater at the mouth of Cherry creek was opened—or, with greater exactness, the first theatrical performance was given. The event occurred in the second story of the old Apollo Hall on the north side of Larimer street between Fourteenth and Fifteenth streets, the second building from the corner of Fourteenth. C. R. Thorne, the first theatrical manager and who is well remembered by the few "Old-timers" still left, had collected courage and funds enough to bring a theatrical aggregation across the plains to a virgin field for Thespian triumphs. The "stars" of the company were Madame Wakely and her three daughters, referred to in most of the old accounts as the "Haydee Family." After a brief season here the Thorne management collapsed. Madame Wakely then took herself and daughters up to Mountain City on her own account and management, where she opened a theatre in a log building. There, she and her fair accomplices, won the hearts and dollars of the miners, from near and far, and in great abundance. The Apollo Hall was built in the summer of 1859 by the Barney Brothers, and was afterward enlarged and named the "People's Theater;" and was the first combined drinking, gambling, and theatrical establishment.

On the evening that Thorne opened in Denver City, the "Cibola Minstrels" "opened" Cibola Hall, or Reed's Theater, in Auraria City. That noted and somewhat notorious place was also one for drinking and gambling, and stood on the west side of Eleventh street between Wazee and Market streets, the buildings now on its site bearing numbers 1456 and 1458.

Both Denver City and Auraria had improved with much rapidity through the summer and autumn of 1859. While the saw-mills had enabled builders to erect a better class of buildings than the log ones, earlier in the season, a supply of brick resulted in still better architectural and structural achievements. Early in the summer Thomas Warren, who had established the ferry, started the first brickyard, and by the middle of August had a kiln burned and ready for delivery. His example was soon followed by others, and by the next year good building bricks were about the most reasonable things in price that the local markets afforded. Some of the log cabins not six months old—none were a year old—were pulled down in the autumn of 1859, to make way for brick and frame buildings. In the present older parts of the city brick buildings put up in the autumn of 1859 and spring of 1860 still stand, not greatly the worse for their forty years of antiquity. In the autumn of 1859 nails sold at twenty dollars per keg, and small window-glass at twelve dollars per box.

Gold dust had become a common circulating money medium, and constituted the greater portion of the "money" of the community; gold and silver coins being unaccountably scarce, and paper currency unknown. The abundance of dust proved the mines of the Pike's Peak region to be incontestable facts. Every business man, barkeeper as well as merchant, had little scales on his counter, and the customer, whether he were settling a bar-bill or paying for provisions, or a mining outfit, passed his buckskin pouch to the vendor who weighed out the amount due him; and if he did not take care to dribble enough dust on the scales to make "down weight" in his favor, it was his own fault.

We have stated that individual mercantile and other enterprises had become so numerous in Denver City and Auraria by the beginning of this year's summer that most of them had lost their historical identity and importance. Upon the whole this statement was correct, but in the autumn a commercial event occurred that was held to have greatly influenced the destinies of "Denver City," and to have established her business supremacy over Auraria. This was the arrival of two large trains of the big "prairie schooners," aggregating thirty huge freight wagons carrying an immense stock of general merchandise. It was in far greater variety than any of its predecessors, and when it was arrayed for sale in stores on Blake street, the "Denver City" partisans were exultant. "Now!" they cried, "No more Mexican trash for free Americans! No more one hundred per cent! The trade is ours, and Denver is saved!" It is not probable that they actually made these exclamatory declarations in words, but that is the way the story is handed down, and it was intended, most likely, to relate what they felt and meant, rather than what they ran around shouting. As it afterward proved, the prophecy was fulfilled as to "Denver City's" salvation, if she really stood in need of redemption, and the alleged declarations soon turned out to be true, excepting the one concerning the objectionable profit of one hundred per cent; that had to wait awhile before it became an established fact in either town. But it will be seen that the two "cities" were still inclined to be fierce in their rivalry; yet the leaven that was to bring them into union as one community, with united purposes toward a common destiny, had begun its work before Jones & Cartwright came in with their long trains of prairie transports, and selected Denver City as the base for their active and very extensive mercantile operations. In 1860 that firm built on the west side of Eleventh street near Market, in Auraria, a one-story brick warehouse, 33 by 125 feet, that was the largest merchandise depot in this part of the country at that time.

Store-keeping in these times was a profitable occupation for men who had sufficient capital to properly conduct it. The business of supplying clothing, provisions, tools and all the odds and ends of things the hurrying, wasteful, reckless population needed, or thought it needed, in the enterprises that were being rushed forward, quickly became a large one. Prices were extravagantly high, chiefly for the truthful reason that the long freightage across the plains or up from New Mexico was an expensive undertaking. But this was often made the plausible excuse for prices far higher than a fair estimate for the freight would put them, and the profits were large. The average customer was usually in too much of a hurry to haggle over the amount demanded, and as a general thing it would have ended in no advantage to him if he did; he could take the stuff or leave it, just as he chose, but the citizen of those days was little disposed to quibble about such things. True the risks were many to the pioneer merchants; their wagons being liable to disabling accident, or capture and pillage by thievish Indians. But in the end, the customer always paid the freight, and there was no resorting to the weary modern mercantile device of selling goods below cost, or pretending to do so, in order to attract customers. A barrel of whiskey with its resourceful possibilities, in "doctoring" and dilution, upon its delivery at Cherry creek in the primitive period, became worth almost its weight in gold, if we may use a somewhat extravagant comparison.

For nearly all the people in "Denver City," "Auraria City," and the mountain and placer mining camps, 1859 was their first year in the country, and they did not know how the weather would behave itself in the autumn and winter. About the middle of September there had been a general snow-storm which was unusually heavy in the mountains for that season of the year, and made it appear that winter had set in with great vigor and earnestness. This caused many of the people who had contemplated going back east late in the fall, any way, to pack up, hitch up, and get away from here forthwith. The snow disappeared in a day or two and a season of beautiful autumn weather set in and lasted until near Christmas. It was estimated that not more than fifteen hundred men remained in the mining camps through the winter. One of those who did took from Nevada Gulch with a rocker, twenty-four hundred dollars' worth of gold in the three months ending January 31, 1860.

The day after Christmas snow began falling heavily and the weather turned bitterly cold. The night of that December 26th still holds its place as having been the coldest period ever known in the history of Denver. Those who were here stated, and the few survivors still reiterate, that the mercury congealed in thermometers and they could not tell by the instruments how cold it was. As mercury solidifies at thirty-nine degrees below Fahrenheit zero, the reader will conclude that that was certainly not a sultry night. Those intending to go back east had gone several weeks before, and "Denver City" and "Auraria City" contained none but those who considered themselves permanent residents. On the first of January, 1860, it was estimated that the two towns had a winter population of at least one thousand.

CHAPTER XXXII.

"TERRITORY OF JEFFERSON"—THE POLITICAL ROMANCE IN THE HISTORY OF SELF-GOVERNMENT—ELECTION OF "DELEGATE" TO CONGRESS, AND REPRESENTATIVE IN THE KANSAS TERRITORIAL LEGISLATURE—PRELIMINARY STEPS TO ORGANIZATION OF PROPOSED "STATE OF JEFFERSON"—ADDRESS TO THE PEOPLE—DELEGATE ELECTIONS—CONVENTIONS, AND FAILURE OF STATE MOVEMENT—RISE, PROGRESS, DECADENCE AND COLLAPSE OF THE "TERRITORY OF JEFFERSON," OF WHICH DENVER WAS THE CAPITAL.

In the autumn of 1858 a few men among the small number then assembled around the mouth of Cherry creek, following the natural bent of the American mind, determined to make an effort to have Congress detach the Pike's Peak region from Kansas Territory and give it a Territorial name and government of its own. These men had then been in this part of the country but a few weeks, and their action under the circumstances of that time, and viewed as it then appeared on the face of things, certainly would seem to have been anticipating events a long way ahead.

While our pioneers were planning their proposed new Territory some of them had also been more effectively at work establishing town-sites. The closing days of September had, as we have seen, brought forth the embryo city of "St. Charles;" and a month later the preliminaries of the more substantial Auraria City were well under way. In those days much of the present area of Colorado was, as we have elsewhere told, attached to the Territories of Nebraska and Kansas. The fortieth parallel of latitude was then the east-and-west dividing line between those Territories, as it now is between their successor States, and their western limits nominally extended through to what then was the eastern line of Utah on the summit of the Rocky Mountain ranges. The fortieth parallel is the present north line of much elongated Arapahoe county, but at that time and notwithstanding the nominal creation of Arapahoe county, Kansas Territory, in 1855, all this region around Denver was Indian country, unorganised, unsurveyed, and open to liberal constructions as to proposed new boundaries. The Indian title to it was not extinguished until two years later.

Two "cities" having been located at the mouth of our historic creek, the next movement—though it might as well be termed an almost simultaneous one, was toward getting the proposed new Territory on its feet. As the first step in that direction, it was decided to elect somebody who could and would go to Washington and importune Congress to create a new Territory here. The pioneers were not very particular as to what its boundaries should be, further than that it should consist of the western part of Kansas Territory and a part of western Nebraska.

Accordingly an election was held on the west side of Cherry creek on November 6, 1858, to choose a Delegate for this duty at Washington. "St. Charles," as a town had been left hanging somewhat in the air, but Auraria City was by that time an actual settlement with the survey of a large part of its town-site completed. This swift political action moved William M. Slaughter, one of the early comers, who was most usefully identified with pioneer affairs, and with many others in later years, to make the following entry in his diary:

> "Just to think that within two weeks of the arrival of a few dozen Americans in a wilderness, they set to work to elect a delegate to the United States Congress, and ask to be set apart as a new Territory! But we are of a fast age, and must prod along!"

At that time there were between one hundred and two hundred people at the mouth of Cherry creek and in the region around it within a radius of twenty or thirty miles, all of whom, excepting the three women who were then here, were privileged to vote at that pioneer election. Though it was assumed to have been held in Kansas Territory, there would have been no troublesome questions about parallel forty asked any freeman who offered a ballot.

H. J. Graham, one of D. C. Oakes' party which had arrived on October 10th, had been selected as the best man in the settlement to deal with Congress. It having been deemed advisable to have Cherry creek represented in the Territorial Legislature of Kansas, A. J. Smith, who had been here about two weeks, having arrived with a party from Omaha on October 20th, was made the candidate for Representative. Graham and Smith were elected to their respective positions without opposition, though it cannot be said that they received an overwhelming vote, as it appears that only thirty-five ballots were cast at the election.

Mr. Graham lost no time in entering upon his duties. On November 8th, but two days after his election, he set out from Auraria City on his long journey to the National Capital. He bore with him as credentials the most imposing documents the resources of Auraria could produce, and letters from all of his constituents who had friends in Washington, or who knew anybody there. After his arrival at the capital Mr. Graham endeavored by every available proper means to accomplish the wishes of his constituents; but without success. Congress did not merely refuse to entertain the proposition, but gave it no serious attention, at all. A few members individually endorsed it, but that was about all the favor it found. Mr. Graham received no compensation for his services, and personally bore all his expenses going and returning, and while he remained in Washington—an unusual instance of unselfish devotion to the public welfare.

Through the winter of 1858-59, pending the results of Mr. Graham's efforts at Washington, nothing further was done at Cherry creek toward Territory-making or State-building, in a political sense. But early in the spring of 1859, when it became known that Congress had done nothing, the indefatigable pioneers here concluded that they would do something on their own account, and see Congress about it afterward.

It may be properly stated here that the great obstacle to securing Congressional action on such a proposition as Mr. Graham presented, and which remained an obstacle for some time afterward, was the then increasing antagonism between the northern and southern sections of the country. The irrepressible conflict between slavery and freedom made both sides jealous and suspicious of any movement toward organizing Territories that would in the nature of things soon develop into States with representatives in both Houses of Congress. The attempt of our pioneers, an account of which follows here, to independently organize a new commonwealth was assailed by both northern and southern critics; one side charging it to be an unlawful movement in the interest of the slave power, while the other alleged that it was intended as an aggression against the southern States, in defiance of national authority over the public domain. As a matter of fact the issue between the north and the south had nothing whatever to do with it. That issue did not figure in the plans and purposes of the pioneers in the Pike's Peak country. Some people, however, raised a different objection to the proposition. They said it would be absurd for Congress to create a new National division in so remote and inaccessible a region in the little known west, for the transient benefit of a few presumably migratory people. But a vacillating, impotent administration was in power—if such a term may be associated with its pitiable weakness—the mutterings of civil war were already audible through the length and breadth of the land, and in the face of all the conditions which then confronted the country it need not have been surprising that Mr. Graham failed to receive attention and consideration from Congress, the divided attention of which was directed to other and more important questions than the mission on which he went to Washington.

Representative Smith had been, in one sense, a little more successful in his mission, having been received by the Kansas Legislature as the Representative of the almost forgotten county of Arapahoe that had been created in the summer of 1855. That Legislature, influenced by the reports from the Pike's Peak region, by an impotent act approved February 7, 1859, abolished the Arapahoe county of 1855 and divided the western end of the Territory into five new counties, one of which, embracing the Cherry creek settlements, was designated "Montana county." We could not ascertain what part, if any, Representative Smith had in the enactment of that law; and we were likewise unable to find any account of other legislation for the alleged benefit of the people in the Pike's Peak country having been effected by him during that winter of 1858-59. At this juncture and for the reader's convenience we remark that an account of the nominal creation of Arapahoe county in 1855, by the Kansas first Territorial Legislature, and of all the details connected with the heretofore unrecorded early history of the county, will be found at length in Chapter LII, and which will make clear the frequent references in this chapter to the county's primitive affairs.

Early in the spring of 1859 the people here had resolved upon organizing a government of and by and for themselves. This feeling crystallized in a public meeting of the citizens of the two Cherry creek towns being held in Auraria on April 11th to take some preliminary action. The following report of that first movement toward establishing a definite civil government here of sovereign powers is taken from the first issue of the Rocky Mountain News, April 23, 1859.

"Public Meeting"

"At a meeting of the citizens of Auraria and Denver City held at Wooton's Hall on the evening of the 11th inst., on motion of L. J. Winchester, Dr. L. J. Russell was called to the chair, and Andrew Sagendorf appointed Secretary; when the object of the meeting was stated by H. McCoy, Esq., followed by Gen. Larimer in a few general remarks, Mr. Collier introduced the following resolution:

Resolved, That on account of our distance from, and difficulty of communicating with, the proper authorities, we the people who are the power here, authorize the late county officers-elect to enter at once upon the discharge of their respective duties, without waiting for their commissions from the Governor, after having received their certificates of election from the Commissioners and having given the proper bonds.

Gen. Larimer, Hon. Wm. Clancy, Judge Wagoner and others spoke at length in favor of the resolution, and were opposed by Hon. Henry Allen. The resolution was lost. On motion of E. P. Stout, Esq., it was—

Resolved, That the different precincts be requested to appoint delegates to meet in convention on the 15th inst. to take into consideration the propriety of organizing a new State or Territory.

Which was carried unanimously. On motion adjourned.

L. J. Russell, Pres.

A. Sagendorf, Secretary.

The "county officers-elect" referred to in the first resolution were those chosen at an election held on March 28th. Of that election and of several other county elections held here in 1859, the reader will, as heretofore remarked, find full particulars in Chapter LII in addition to what is necessarily said of them in this chapter. At that election 774 votes had been cast, and voting had been done in seven "precincts," which were those referred to in the second of the foregoing resolutions.

Pursuant to Mr. Stout's resolution, a meeting of the Auraria citizens was held on April 14th to appoint delegates to the proposed convention. The following report of its proceedings is also taken from the first issue of the Rocky Mountain News:

"Auraria, K. T., April 14.

"Pursuant to call, a number of the citizens of Auraria, K. T., met in the store-room of R. L. Wooton. Henry Allen was called to the chair, and stated that the object of the meeting was to appoint delegates to attend a convention to be held in Auraria on the 15th inst. to take into consideration the project of organizing a new State. W. D. McLain was called upon to act as Secretary of the meeting. On motion it was voted that the Chairman should appoint a committee of three to nominate six persons to act as delegates to the convention. The chair appointed R. L. Wooton, Thomas Pollock, and D. D. Cook. After a short absence the committee reported the following names of those to act as delegates: H. Allen, L. J. Russell, D. D. Cook, W. M. Slaughter, W. D. McLain, and Thomas Pollock. On motion it was voted that the report be accepted and the committee discharged.

On motion it was voted that the persons suggested by the committee be appointed to act as delegates. Mr. White then offered the following resolution:

Resolved, That the delegates be instructed to act in the convention with a view to forming a State government, and that they should let no sectional influences sway them in their deliberations.

The resolution was adopted and on motion it was voted that the minutes of this meeting be published in the Cherry Creek papers. Minutes read and approved. On motion the meeting adjourned.

H. Allen, President.

W. D. McLain, Secretary.

At that time there were no "Cherry Creek papers." Merrick was here with his little printing-outfit, but had not issued a paper. Byers, Gibson and Dailey had not yet put in their appearance, though it would seem probable that the Aurarians had tidings of their presence in the country and of their prospective advent at Cherry creek.

Meetings at other places, to appoint delegates, were held, including one in Denver City; but the proceedings of the latter are not of record.

The convention met on April 15th in "Wooton's Hall"—the second story of Wooton's "business block" wherein the News was established a few days later. General William Larimer, Jr., was made temporary Chairman, and Henry McCoy temporary Secretary. The committee on credentials reported the following-named duly accredited delegates present:

THE WESTERN TERRITORIES
AFTER THE PASSAGE OF
THE KANSAS-NEBRASKA BILL
UTAH TERR
KANSAS TER
GULF OF
MEXICO

Fountain City—Henry McCoy, George McDougall, H. Rogers, J. R. Shaffer, A. Thomas, and S. W. Wagoner.

El Dorado and El Paso—Josiah Hinman, L. J. Winchester, Thomas Warren, C. Gilmer, G. W. Putnam, and T. Edwards.

Arrapahoe—Messrs. Fisk, Castro, Cook, Cochran and Davidson.

Auraria—Henry Allen, W. M. Slaughter, L. J. Russell, D. D. Cook, W. D. McLain, Thomas Pollock.

Denver City—H. P. A. Smith, J. T. Lowrie, C. H. Blake, J. Merrick, Wm. Larimer, Jr., and Wm. Clancy.

It will be noticed that several of the delegates from Fountain City, El Dorado and El Paso were men from the Cherry creek towns whose names have become familiar ones in our story. These men had visited those alleged "cities" to arouse enthusiasm for the proposed new State, and their few people had made them delegates, though they were not residents of those settlements.

The convention was permanently organized by electing S. W. Wagoner, President; General William Larimer, Jr., George McDougall, D. D. Cook, C. Gilmer, and Thomas Pollock, Vice Presidents; John L. Merrick, J. R. Shaffer, Thomas Warren, C. H. Blake, Josiah Hinman and —. Fisk, Secretaries. Thus twelve of the thirty delegates were honored with official positions in the convention.

The proceedings then took on the form of speech-making, and some very good ones were delivered. The sentiment was practically unanimous for a movement for the immediate organization of a new State from parts of Kansas, Nebraska, Utah and New Mexico, without going through the usual Territorial probationary period. It was held that conditions in the new country were such and would continue to be such that a Territorial government would be inadequate and exceedingly unsatisfactory; a brake upon the wheels of progress, an injustice to the people and an official nuisance; and that nothing but a free and independent State would meet the impending requirements. It may be said here that the Territorial government Congress later instituted turned out to be at times during its existence pretty nearly everything bad that these men predicted for it. After the speeches were concluded, the convention adopted the following resolution, and then adjourned until seven o'clock in the evening:

"Resolved—That the discussions of this convention shall have but one object, viz.: The formation of a new and independent State of the Union."

At the evening meeting a long preamble and a series of resolutions were adopted. There was a recital of the motives inspiring the people to this independent action to establish a State Government; of the conditions attending their remoteness from organized efficient civil authority; and of the various other reasons for at once organizing here a new State of the Union. The presentation of the circumstances was ably made. The resolutions called upon all the citizens of the proposed State to choose delegates, one to each 250 of population, to meet in convention at Denver City on the first Monday in June—the 6th day of the month—to draft a constitution and make further arrangements to execute the purpose of the State movement thus instituted by these preliminary meetings; they fixed the second Monday in May as the time for holding these delegate elections; they specified that the constitutional convention should provide for submitting the constitution to a vote of the people, and for the election of State officers, members of the Legislature, and "representatives in Congress;" and beside fixing the time for such elections, should appoint election officers for each "precinct." For the delegate election they established "precincts" as follows: Fort Laramie, Colona, Cache-a-la-Poudre, Arrapahoe City, Boulder City, Lupton's Fort, Cheyenne Pass, South Park, Jefferson, Sanders' Ranche, Auraria, Denver City, Douglass City, Eldorado, Fountain City, Fort Garland, Montana, Brownsville, Huerfano, Russellville, El Paso, Canon City, and Junction City.

Most of these places, the names of which would indicate settlements, were far more prospective than actual as new towns; for example, "Russellville" was a place on the headwaters of Cherry creek where the Russell party had stopped for a few days in the summer of 1858, and where a solitary "dug-out" cabin had later been built. But there were quite a number of prospectors up there in the spring of 1859.

The resolutions appointed William Clancey, C. Davidson, C. Gilmer, J. R. Shaffer, and William M. Slaughter a Central Committee with power to organize such additional precincts for the delegate election as might come under their knowledge or that new circumstances might require; to notify all precincts of the action of this preliminary convention; "and to do whatever they may think best to carry out the object of this meeting." People were then daily coming into the country by hundreds, and the old "precincts" of vague and elastic definitions were believed to be inadequate to the new conditions.

The boundaries of the proposed new State were defined by resolution as follows:

"Resolved, That the State contemplated shall embrace the following territory, viz.: Its northern boundary commencing at the 102nd meridian of west longitude from Greenwich, Eng., with the 43rd parallel of north latitude, and running west on the said parallel to its intersection with the 110th meridian of west longitude, thence south to the 37th parallel of north latitude, thence east on that parallel to the 102nd meridian, and thence north to the beginning; and that the name thereof shall be the State of Jefferson."

These boundaries defined an area much larger than that of the present State of Colorado—nearly one-half larger. The eastern and southern lines—the 102nd meridian and the 37th parallel, were the same as those of our State; the west boundary went one degree of longitude farther into Utah than that of our State; the north boundary, the 43rd parallel, which is the north line of the State of Nebraska, passes through the present State of Wyoming, east and west, about midway between its northern and southern limits. The "State of Jefferson" was to have been a large one—a parallelogram of about 320 miles mean width east and west, and 417 miles north and south. But the pioneers of Denver placed no modest limitations on any of their numerous ambitions.

Another resolution appointed L. J. Russell, H. P. A. Smith, L. J. Winchester, Henry McCoy, and D. B. Castro a special committee to prepare and issue an address to the people of the proposed new State, setting forth the urgent reasons for immediate action, and appealing to them to heartily co-operate in the movement for creating the great "State of Jefferson." A motion was then adopted directing that these proceedings of the meeting "be published in all the papers in the United States friendly to our objects." Having done about all that it could do at that time, this pioneer convention of State-founders then adjourned.

The committee lost no time in preparing the address, and in it the handiwork of Dr. L. J. Russell is apparent. The document is of so much interest that we present it here in full:

"It has been made our duty to address you at this time, to set briefly before you the reasons for requesting you to unite as one man in throwing off the feeble ties that bind us to the far off governments of our several Territories, and forming what in our isolated position becomes a necessity, viz.: a new and independent State. It has always been the policy of the United States to form, and admit new States into the Union, as fast as the necessities of the people have required it. So much has this been the case that it may almost be called an immutable rule; and how strongly does this rule apply to us. Severed by a distance of over seven hundred miles from the governments of Kansas and Nebraska, and four hundred from New Mexico or Utah, nature itself has rendered it impossible for us to depend upon either of them. The time necessary to send a petition or receive even a message of any kind is so great, that such a government becomes almost a farce, and we are forced to act as if we had nothing but ourselves to depend upon. The business of our intended State will be principally mining—of the others entirely agriculture—two means so different as to be, under the circumstances, incompatible. The prices of labor are and will be so different that no laws that apply to one will apply to the other; while divided as we are between Kansas, Nebraska, New Mexico and Utah, our representation will be but nominal with each, and we at the mercy of men who know nothing of our wants, can not realize our situation, and will use their positions only to enrich themselves at our expense.

Again, if crime be committed, the U. S. Courts of a Territory are the only ones competent for a trial, and what criminal will be deterred from the commission of crime when his judge is separated from him by seven hundred miles of arid waste? Government of some kind we must have, and the question narrows itself down to this point: Shall it be the government of the Knife and the Revolver, or shall we unite in forming here in our golden country, among the ravines and gulches of the Rocky Mountains, and the fertile valleys of the Arkansas and Plattes, a new and independent State? Shall the real keystone of the Union be now set on the summit of the arch, and a republic inaugurated that can, from her mountain aerie, cast her eye to the Pacific on the one hand and the Atlantic on the other? Embracing the waters of the Arkansas and the Plattes flowing into the Atlantic, Grand river and the Colorado flowing into the Pacific, she at once becomes the real center of the Union.

We may soon expect the advent of the iron horse, and a national railroad is no longer a question. Northern and southern routes will no longer be a cause of delay, for nature has provided by her golden largess an argument for its location that will be irresistible, and both roads will become not a disputed issue, but a remunerative speculation.

Let us then all unite as one in so great an object; forgotten be for the time all party creeds and political differences, and with an eye solely to so glorious a result, let us all push forward to the one point before us, the formation of the State of Jefferson. The convention of which we are for the present the mouthpiece, has decided its limits to be from longitude 102 deg. west, to longitude 110 deg. west, on the 43rd parallel of latitude, as the northern boundary; from lat. 43 deg. north to lat. 37 deg. north, on the 110th deg. of west long., as the western boundary; from that point following the 37th deg. of lat. to long. 102 deg. west, as the southern boundary; and the 102d deg. of long. to the first mentioned point, as the eastern boundary. It will thus be seen that we include within our limits all the material necessary to make not only a State, but a nation. With our mountains teeming with minerals and metals of every kind; our valleys richer for agricultural purposes than any part of the Union, with a population hardy as the hills they traverse, and prairies to divide us from the rest of the world, we may indeed feel free as the mountain air which brings to us health and vigor. Let each precinct be represented fully at the constitutional convention on the first Monday of June, and let each member feel that upon him devolves a responsibility such as can happen but once in a life. Each precinct will be entitled to one delegate and one for each 250 voters in the precinct; and let no portion of the State be omitted in the election of delegates. It is a glorious cause, and a feeling of pride as well as of duty should lead us to act in it. Let each individual then feel that upon him rests a responsibility to see that the best men are selected, and that the future interests of his home be not entrusted to those who will betray the trust confided to them.

H. P. A. Smith, Denver;
Henry McCoy, Fountain;
D. B. Castro, Arapahoe;
L. J. Russell, Auraria;
L. J. Winchester, El Dorado.

The second Monday in May, named as the day on which delegates to the proposed convention to arrange for organizing "a new and independent State of the Union" were to be chosen, was the 9th of that month. By that time there were indefinite but exciting rumors floating in the air that great discoveries of gold had been made somewhere near, but few knew just where; as knowledge of Jackson's and Gregory's good fortune had not yet become public. Notwithstanding these reports that were so well calculated to divert the minds of men from politics, the elections, most of which were to a great extent nominal, were held, or were alleged to have been held, in nearly all the "precincts," and delegates more or less duly chosen. The Denver City men "met at the store of Mr. Bouldoc" and selected William Larimer, Jr., J. M. Fox, H. P. A.

Smith, William Clancey, R. E. Whitsitt, S. M. Wagoner, S. W. Beall, W. P. McClure, and E. P. Stout. The Aurarian's met at Wooton's store and chose, "by acclamation," William N. Byers, Andrew Sagendorf, L. J. Russell, Henry Allen, Thomas Pollock, William M. Slaughter, R. L. Wooton, D. D. Cook, and W. D. McLain.

The day appointed for the convention to assemble in Denver City, June 6th, found the whole region in a babel of uproar and enthusiasm over the Gregory and Jackson discoveries and the subsequent developments. Nevertheless, the convention met promptly on the appointed day at "Blake & Williams' Hall," or the "Denver House" as it was otherwise called, and temporarily organized by electing William N. Byers, President; and Thomas Gibson, Secretary. There were fifty delegates present representing Denver City, Auraria, Fountain City, Douglass City, Lupton's Fort, Gregory Diggings, Huerfano, Sanders' Rancho, El Dorado, Russellville, Baden, Highland and Colona. The permanent officers chosen were S. W. Wagoner, President; Henry Allen, E. P. Stout, Richard Sopris, Levi Ferguson, C. B. Patterson, Vice Presidents; Thomas Gibson, Secretary; John J. Shanley, Assistant Secretary; and J. P. Farrer, Sergeant-at-arms. The pioneer Methodist clergyman, Rev. G. W. Fisher, then instituted the convention's proceedings with a prayer.

On motion of William N. Byers, the President was directed to appoint several committees of three to prepare a constitution, each committee to be assigned a certain portion of the proposed instrument; the President to report these committees to the convention the next day. Thereupon the convention adjourned to meet the following morning.

It had been decided early in the proceedings that owing to the relatively small attendance of delegates, and in consideration of the extraordinary circumstances then existing, with men flocking into the country in droves, it would be better that the convention make all necessary preliminary arrangements, and then adjourn temporarily to a date when there could be a larger attendance of delegates that would include representatives of the incoming people.

On June 7th the President reported the several committees as follows:

On Boundaries and Bill of Rights—W. N. Byers, E. P. Stout, and Dr. Joseph Casto.

Suffrage and Distribution of Power—William Larimer, Jr., W. M. Slaughter, and W. J. Foster.

Legislative and Executive Departments—Henry McCoy, A. J. Williams, and William Clancy.

Judiciary—N. G. Wyatt, W. P. McClure, and Henry Allen.

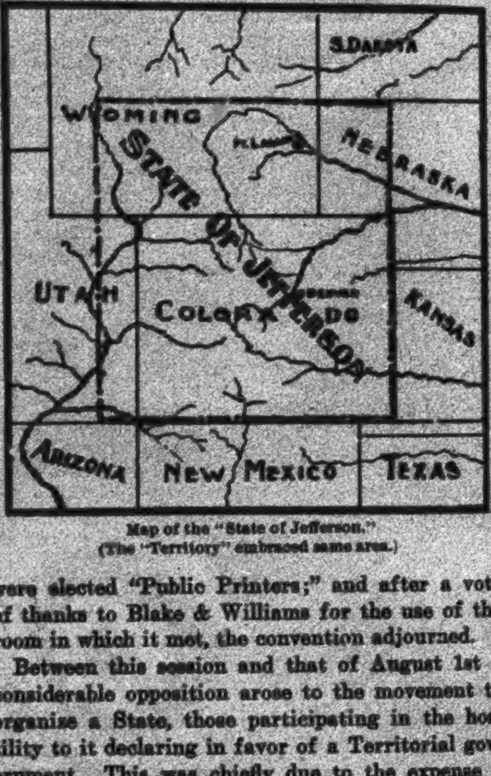
Militia, State Debts and Corporations—J. H. Turner, Hickory Rogers, and R. E. Whitsitt.

Education and School Funds—L. J. Russell, S. W. Beall, and J. J. Rariden.

Amendments and Miscellaneous Matters—J. M. Fox, J. R. Shaffer, and Thomas Warren.

Schedule—L. J. Winchester, H. P. A. Smith, and D. D. Cook.

On motion of William N. Byers these several committees were instructed to be prepared to report to the convention at its next, or adjourned, session. It was then decided that when the convention adjourned it would do so to meet again on the first Monday in August. E. P. Stout, N. G. Wyatt, and D. Davis were appointed a committee to designate still more new voting precincts in order that additional delegates might be elected, to the end that the region and all the new people should be fully represented in the work of forming the intended new State; the choice of the name "Jefferson" was further confirmed; Byers & Gibson were elected "Public Printers;" and after a vote of thanks to Blake & Williams for the use of the room in which it met, the convention adjourned.



Map of the "State of Jefferson."
(The "Territory" embraced same area.)

Between this session and that of August 1st a considerable opposition arose to the movement to organize a State, those participating in the hostility to it declaring in favor of a Territorial government. This was chiefly due to the expense a State organization would entail and to the argument that much of the expense of a Territory would fall upon the United States treasury. But the wisdom of adjournment and delay was demonstrated when the convention re-assembled on Monday, August 1st. Instead of but fifty delegates representing thirteen precincts, there were now in attendance, including those chosen in the interval, 164 representing forty-six precincts. Among this imposing array of representatives were many able men, and many who had had experience in such work as they had met to do, in the older regions they had left behind them.

The first day's session was held at Blake & Williams' "Denver House," when it was decided to occupy Kasserman & Company's building in Auraria—on the southwest corner of the present Lawrence and Tenth streets—during the remainder of the session. At the close of the first day's proceedings the officers of the convention holding over from June, resigned in order that there might be a further division of honors. Therefore, on Tuesday morning new ones were elected as follows: President, Captain A. F. Garrison; VicePresidents, O. M. Wood, E. P. Stout, W. D. Arnett, and Hickory Rogers; Secretary, Thomas Gibson; Assistant Secretary, Henry McAfee; Sergeant-at-arms, George West. Rev. W. H. Goode was elected Chaplain of the convention and opened the day's proceedings with a prayer.

The convention remained in session that entire week. As in every American political gathering, there were sharp differences of opinion, plan and purpose. On Tuesday there was developed among many of the delegates a decided preference to abandon the State project and in its stead to memorialize Congress to immediately establish a Territorial government for the Pike's Peak region. Resolutions to this effect were submitted by H. P. A. Smith, A. J. Williams, and S. W. Beall, and warmly debated. Then a committee was appointed to consider which road the convention should follow. There was a majority report in favor of a State, and one from the minority urging a memorial to Congress for a Territorial government, with the view of deferring State action until the next year. Debating these propositions without coming to a conclusion occupied the convention's attention until Thursday morning, when the following compromise resolution by Eli Carter was adopted:

"Resolved, That the convention now proceed to prepare a Constitution for the State of Jefferson; And also that the convention appoint a committee of 13, whose duty it shall be to prepare a Memorial to Congress, asking the immediate organization of a Territorial Government for the Territory of Jefferson; and that said Constitution and Memorial both be submitted to the voters within the limits of said State-Territory, on the first Monday of September next for their approval or rejection."

This reference of both propositions direct to the people was satisfactory to all the delegates, and the convention proceeded with its work. The membership of the several committees on constitution was increased from three to five, and Carter, Wyatt, Larimer, Wagoner, Post, De La Mar, Fox, Steele, H. P. A. Smith, Roberts, W. G. Russell, Link and Winchester were appointed a committee to prepare the Territorial Memorial.

The committees on constitution began reporting on Friday, as the work had been practically completed in the interval since June. On Saturday morning the Territorial Memorial was approved. By noon of that day all of the committee reports on the constitution were in, and after a few amendments, the organic law of the proposed new commonwealth was put together and adopted. It retained the boundaries of "Jefferson," as had been defined by the preliminary convention of the preceding April, and confirmed the choice then made of a name for the intended State. A committee was appointed to apportion the proposed State into Senate and Representative districts, and two thousand copies of the constitution and of the Memorial were ordered printed for general distribution among the people. Then a resolution was adopted providing that there should be only two forms of ballots used at the election, in which the vote should be on both State and Territorial propositions; that ballots reading "For Constitution" should "be considered a full and complete negative to a Territorial organization;" and that ballots reading "For Territory" should "be considered a full and complete negative to a State Constitution."

Provision was also made for holding an election on the first Monday in October—the 3rd, which was the legal election day in Kansas Territory, for Delegate or representative in Congress, regardless of the result of the September State-Territory election; and also for the election of a full complement of State officers, and a Legislature, at the same time in anticipation of the State proposition being accepted by the people.

The convention then provided for various details with relation to the State-Territory election, which was fixed by the constitution to be held on the first Monday in September, 1859—the 5th day of the month; ordered returns thereof to be made to Denver City to be canvassed by the "County Judge" and two "Justices of the Peace," which officers had been elected in the previous March; ordered a copy of the constitution and of the Memorial to be sent to the President of the United States, to the President of the Senate, to the Speaker of the House, and to the Secretary of State of each State in the Union; and then, having completed its labors, the convention adjourned Saturday evening and passed into history.

Much to the surprise of the friends and advocates of the "State of Jefferson," the election of September 5th resulted in the defeat of the State movement by a relatively large majority. In Denver City the vote was 573 for a Territory and but 70 for a State; in Auraria 373 for a Territory and 114 for a State. The total vote in the region was regarded as a light one; having been 2,007 for a Territory to 649 for a State. In the mining towns and camps the vote was very light, the miners generally having taken very little interest in the matter; and in some precincts no elections were held. But, of the thousands who had streamed into the country through the spring and summer of 1859, two thirds had gone back in disgust to the States before September. However, charges of fraud, ballot-box stuffing, and other political iniquities were freely made by the advocates of the rejected constitution and would-be founders of a new State; but the adverse vote was relatively too heavy to be wholly accounted for by irregular methods of voting and counting. So, to borrow the famous phrase of Mr. Ingalls, of Kansas, the "State of Jefferson" was no longer even "an iridescent dream." The "Jefferson" constitution was a very comprehensive and creditable document, and many of its provisions are incorporated in the present constitution of the State of Colorado. Its fate was much deplored by its advocates, who were generally the more substantial citizens, and who were sick of the unorganized conditions here and of the trying consequences they entailed.

The people of the Pike's Peak country having rather overwhelmingly expressed a preference for a Territorial form of government, the next step was to make provisions for carrying the public will into effect. While the trails of ambitious politicians were to be seen over all these proceedings, including the defeat of the State proposition, and may still be traced, the general situation was a rather serious one for the earnest citizens who cared less for politics than they did for good order, and some stability in local affairs. The communities had been a year practically without law, and that kind of existence had become intolerable. So, they began the habilitation of the proposed Territorial Government without much delay. This enterprise has been stigmatized as a scheme of self-seeking politicians, and it probably had in it some element of that kind. But it promised the people something in the emergency, and almost anything in the form of organized government were better than the condition of no government, at all.

On September 24th "a meeting of the citizens of the Mountains and Plains"—as the record states it—was held in Auraria to begin the work of organizing a Provisional Territorial Government, with J. M. Ferrell in the chair, and J. D. Henderson the Secretary. Methods of procedure were briefly discussed when, on motion of W. P. McClure, a committee consisting of John C. Moore, and S. W. Wagoner of Denver; Henry Allen, of Auraria; L. W. Bliss, of Golden City; and J. H. Gest, of Mountain City, was appointed to prepare an address to the people of the Pike's Peak country, setting forth the necessity for immediate action, and recommending that the several precincts hold elections on Monday, October 3rd, to choose delegates to meet in convention at Denver City on October 10th "for the purpose of forming a Provisional Territorial Government."

The meeting then resolved "to report its proceedings to a popular meeting to be held at seven o'clock this evening in Denver City, of the citizens of Denver and Auraria, for ratification;" and then adjourned.

There was a large assemblage of men at Blake & Williams' "Denver House" that evening to consider the report of the Auraria meeting, and was presided over by William M. Slaughter. The address committee had been industriously at work in the short interval, and had their document in shape. After a few unimportant changes it was approved by the evening meeting, and two thousand copies were ordered printed and sent forth over the country. In general character it was much like that of the one sent out by the preliminary State convention in the previous spring; reciting conditions, anticipating large immigration early the next year, and urging the election of delegates on October 3rd. In this address it was also pointed out that the jurisdiction of Kansas Territory could not be extended over this region so long as the Indian title to the country remained in effect, citing the 19th section of the act of Congress creating Kansas Territory, in which it was said appeared a provision that all territory to which the Indian title had not been extinguished should not be regarded as within the jurisdiction of Kansas Territory until the occupant tribes should voluntarily consent to have their lands placed under Kansas jurisdiction. This, said our pioneer statesmen, the Indians here had not done; and they cited that provision of the organic law of Kansas as one of the strong arguments for the immediate independent action they proposed. They also stated that by that provision of the Kansas organic act all courts of criminal jurisdiction, and of appeal, were barred from this region.

To some extent this view was erroneous. The provision of the Kansas organic act referred to, applied only to Indians with whom treaties had been made; and these at that time were the Indians located in central and southeastern Kansas, on what was then the frontier. Not having anticipated that a settlement would spring up far off in the heart of the Indian country, the government had made no treaties with the Indians in this region; and while they had not been specifically placed under, or set apart from, the Kansas jurisdiction, the title to the region here was, under the common practice of the government, regarded as resting in them. So, under that practice, and in the absence of treaty provisions, it was a question whether Kansas jurisdiction, under any color of claim, extended over the Pike's Peak country.

The day appointed for electing delegates to frame the Provisional Government of Jefferson Territory—the legal Kansas election day—was the same that had been fixed by the shifty yet prudent "State" constitutional convention of August 1st, for the election of a Delegate in Congress, in the event—which now had come to pass—of the people expressing a preference for a Territorial rather than a State government. Under the arrangements, this Delegate was now to be the Representative of the people in the Pike's Peak country, was to take charge of the Memorial to Congress, take up Mr. Graham's task where he had been forced to leave it, again endeavor to have this region detached from the other Territories, and recognized and organized by Congress as a separate political division.

For this position as ambassador at Washington there were several candidates—Samuel Adams, Hiram J. Graham, C. A. Roberts, R. W. Steele, J. H. St. Matthew, Beverly D. Williams, and George M. Willing. The election was recklessly conducted, and Hollister says "there was terrible ballot-box stuffing." This may have been so, and probably was; but whether there was or not, B. D. Williams, who had been the first manager at Denver, of the Leavenworth & Pike's Peak Express, came out of the scrape with a large plurality of votes, and received his certificate of election. Out of a total of 4,386 counted votes, he was given 1,911. It was in behalf of Willing that the worst of the frauds were alleged to have been committed, and nominally he had most votes. But, as upward of 2,000 of them had been returned from alleged precincts of which no one had ever heard, they were thrown out. But Williams did not get his certificate without much noisy protest. All the returns were questioned, their validity disputed, the Board of Canvassers reviled, and the vote denounced as having been largely fraudulent, by one or another of the candidates, and there was almost no end of wrangling over the result as at last formally determined.

Beverly D. Williams.
(Photographed 1890.)

For that matter the whole proceedings were without authority of law, but all the contention and outcry had finally left Williams in possession of his plurality and his certificate. This immediate Denver region, as a part of Kansas Territory, had been, was, and would be represented in Congress by the Delegate regularly elected in Kansas Territory, who would continue to represent the whole of that Territory until Congress decreed otherwise. However, Williams went to Washington, but all that he could and did do was to act as the general political agent there for the people in the Pike's Peak country, and to endeavor to persuade members of Congress to provide a new Territorial government for them, as prayed for in the Memorial, of which Williams carried thither what was regarded as the "official" copy. But more than a year elapsed before the prayer of the Memorial was granted. Williams was given a left-handed recognition by Congress, admitted to the lobby of the House, and received with consideration at the Departments; but he had no actual standing as a Delegate. He thus served capably, loyally and faithfully during the two sessions of that Congress —1859-61—and was instrumental in securing the final attention and action resulting in the creation of the Territory of Colorado in the usual and regular way in February, 1861. He is now a citizen of Little Rock, Arkansas.

Acting upon the recommendations and appeal made by the Auraria and Denver meetings of September 24th, most of the precincts at which the Congressional Delegate was voted for, elected Delegates to the proposed Territorial convention to be held the following Monday.

These, however, were not the only elections held on that politically busy 3rd of October. There were some men in Denver and Auraria who understood, and appreciated at its full value, the legal status—or lack of it—of all that was going on. "Montana county," as well as the others, of the act of February 7, 1859, having become practically reminiscences, they knew that if any county, whether Montana or Arapahoe, existed here, it was a county of Kansas Territory; and they decided that it was still Arapahoe county. The county organization elected the previous March had not been succeeded by any other attempt at a local civil organization, and almost wholly in theory rather than in practice it had, in its merely nominal way, and with the assistance of the Miners' and other irregular emergency Courts, supplied about all—which was not much—the form and material of local "government" that had thus far been more or less enjoyed in the region. Asserting that the "election" of Legislator Smith in November, 1858, and the "county election" of the previous March, had been at least nominally held by the people as citizens of Kansas Territory, these men did not allow the opportunity to pass without doing something in Arapahoe county, on the regular election day in October, consistent and in harmony with the laws governing that Territory, so far as they were able. On the eve of the election of a Delegate in Congress and of the Territorial constitution delegates, a full county ticket for "Arapahoe county, Kansas Territory," was quietly arranged. The mass of the people had become enthusiastically loyal to the movement for a new and independent Territorial government, but the sponsors of this county ticket went through the forms, on October 3rd, of holding their county election; and their candidates were "elected" by a small vote cast in only two or three precincts. But, it was a formal though nominal recognition of Kansas law.

This extremely muddled state of affairs, this impending change from practically no government to two or three active varieties of it, impelled the Rocky Mountain News to editorially say, with a note of lamentation, in its issue of October 6th:

> "So it goes; one day we understand that we are cut off from Kansas; the next, we have cut ourselves off, and will pay no regard to Kansas Legislation, but have an independent provisional government of our own; and the very next, when there is a chance for a petty office under Kansas laws, there are hundreds ready to enter the lists, and before their certificates of election are dry in their pockets you will hear them lustily advocating 'independent government,' and 'let Kansas go to the dogs.' When this county scheme was started, why was it not carried out, and members of the Kansas Legislative Assembly elected, also? Nobody seems to have thought of that except two or three shrewd ones who, we learn, received a few votes for Representative, and under them will claim seats in the next Kansas legislature, not the representatives of the people, but of a few of their friends."
>
> "Here we go, a regular triple-headed government machine. South of 40 [parallel] we hang on the skirts of Kansas; north of 40 on those of Nebraska. Straddling the line, we have just elected a Delegate to Congress from the Territory of Jefferson; and ere long we shall have in full blast a Provisional Government of Rocky Mountain growth and manufacture. This last we hope may succeed, and swallow up the delectable uncertainty of law now existing; when one man claims that he lives in Arapahoe county, while his neighbor asserts that he is in Montana—where one man acknowledges Kansas laws, and another says he is on Indian land where no law can reach. A compact of the people under any name, state, territory, or provisional government, if either can be effected, is better than the present, and if some such is not soon adopted, with a determination to abide by, and respect it, we bid fair to out-Kansas Kansas herself."

The "Montana" mentioned by the News was the "Montana county" of the Kansas act of February, 1859, and which embraced pioneer Denver; but the provisions of that act, as recounted fully in Chapter LII, appear never to have been carried into practical effect.

The Provisional Government convention assembled in Apollo Hall, Denver, on Monday, October 10th; twenty-seven precincts were represented by eighty-seven delegates. Those from Denver City were Hickory Rogers, W. P. McClure, Samuel Bennet, John C. Moore, P. Talbott, A. G. Baber, S. W. Wagoner, B. D. Williams, O. B. Totten, Drake McDowell, and C. H. Blake; from Auraria, W. M. Slaughter, Thomas Warren, C. L. Goldsir, Henry Allen, R. L. Wooton, Thomas Pollock, H. R. Hunt, John M. Clark, W. H. Middaugh, M. D. Hickman, and —. Jeffards; from Highland, E. R. Parks. R. W. Steele was made temporary President, and L. W. Bliss temporary Secretary.

The permanent organization was R. W. Steele, President; H. P. A. Smith, J. W. Farrell, Henry Allen, G. E. Spencer, and W. G. Preston, Vice Presidents; O. B. Totten and G. L. Wood, Secretaries. The convention then went into Committee of the Whole, indulged in speech-making, and formally decided it to be expedient to at once organize a Provisional Government; after which it adjourned for that day.

On Tuesday, H. P. A. Smith, who had objected to being made one of the Vice Presidents, threw into the convention what he supposed would be a bombshell. He had actively participated in all the movements for an independent government, but now entered a protest against, and in a speech denounced, the objects and purposes of this convention. His speech was a rather fervid elaboration of his protest; the latter, reduced to writing and placed on the minutes of the convention, having been as follows:

> "The undersigned on the part of his office in this convention, hereby solemnly protests against the action of this convention in attempting to organize a Provisional Government, for the following reasons, viz.:
>
> 1. We now have all the laws that exist in Eastern Kansas, adopted under the constitution of the United States.
> 2. We have no legal right to form such a government.
> 3. This is not called for by the People, nor is it necessary or proper.
> 4. It will abrogate all legal rights, and throw the country upon the results of a gigantic Vigilance Committee.
> 5. Before such a government can be formed we shall have a proper and legal government from Congress.
> 6. We have elected a Delegate to Congress asking for a Territorial form of Government, and repudiating at the same time the laws of the United States."

Notwithstanding that most of Smith's propositions were sound, from a legal standpoint, the convention, beyond receiving and placing them on its minutes, gave them no heed, but went ahead with its work. Though of fewer members than the "State" convention of August 1st, it was an expeditious, business-like body. In a session of three days ending on the evening of the 12th, it prepared a Territorial constitution which was of unusual brevity and compactness, in compensation, perhaps, for some of its defects and omissions. Still it was a fair document, and its crudities could be remedied afterward if need be.

The Territorial constitution retained and confirmed the name "Jefferson," and defined the boundaries of the Territory exactly as they had been outlined for the State. The constitution was in substance a condensed adaptation of that of the "State" except as to details arising from the differences in form of government provided for. The division for legislative purposes was into eight Council districts, one member from each; and into nineteen Representative districts, from which twenty-one members were to be elected; the extra ones coming from the Denver and Auraria districts, each of which was given two members. Denver and "Russellville" constituted the First Council District; Auraria, Plum Creek, and Fort Eyrie the Second; Highland going with Golden City, Golden Gate, and the town of Arapahoe to form the Third. The First Representative District consisted of Denver and "Russellville;" and the Second, of Auraria, Plum Creek and Fort Eyrie; Highland and Arapahoe constituting the Fifteenth. Provision was made for an election to be held on the fourth Monday of that October—the 24th—at which the constitution was to be voted on and Territorial officers elected subject to approval of the constitution. To avoid conflict with the previous local election and other acts of the people, Section 7 of Article VIII of the constitution was made to read:

> "Contracts heretofore entered into are hereby affirmed, as also the official acts of officers; and all elections, and other acts of the people in their sovereign capacity with the officers-elect at such elections are hereby endorsed."

To complete all preliminary arrangements the convention nominated candidates for all the Territorial executive offices, and these men issued an "address" a day or two later of the general tenor of the several preceding documents of that kind, and of which there appears to have been an abundance in that year. After the convention adjourned, an independent ticket was nominated with rival candidates for nearly all the offices; the two tickets having been as follows:

Convention Ticket.

For Governor—R. W. Steele;
For Secretary—L. W. Bliss;
For Treasurer—George W. Cook;
For Auditor—C. R. Bissell;
For Attorney-General—R. J. Frazier;
For Chief Justice—A. J. Allison;
For Associate Justices—J. N. Odell, E. Fitzgerald;
For Clerk of Supreme Court—O. B. Totten;
For Marshal—John L. Merrick;
For Sup't Public Instruction—Henry McAfee.

Independent Ticket.

For Governor—J. H. St. Matthew;
For Secretary—Frank DeLa Mar;
For Treasurer—R. L. Wooton;
For Auditor—R. S. Parks;
For Attorney-General—Samuel McLean;
For Chief Justice—S. J. Johnson;
For Associate Justice—L. W. Borton;
For Marshal—Hickory Rogers.

At the election on October 24th the constitution was ratified by an almost unanimous vote—1,852 to 280; a total of less than one-half that alleged to have been cast at the election for Delegate in Congress three weeks before. Denver City gave 208 for the constitution and 11 against it; Auraria 319 for, and 13 against. Steele was elected "Governor" by 1,547 to 460 for the head of the independent ticket; and his associates on his ticket were chosen by about the same vote. Of course, there were charges of fraud, corruption, false counting and all the rest, but they availed nothing; though some of the election proceedings were not entirely above suspicion.

The reader will recall that under the miserable system of Territorial government in vogue in this country, the executive officers of a Territory are the appointees of the President, and the elective Legislature is a body of limited powers. In earlier times the Governors were usually non-residents and often sadly decayed politicians, thus sent into a semi-retirement in order to get rid of them. Happily, the system has nearly exhausted itself through lack of Territories for its perpetuation.

Robert W. Steele, Governor of "Jefferson Territory."
(Photographed 1895.)

This "Jefferson" Territorial convention had relieved Congress of all trouble in creating a new Territory here in the west, and President Buchanan of all embarrassment in selecting from his hangers-on the usual complement of officers to be sent out to govern, or misgovern, it. The "Territory of Jefferson" had sprung from its own soil, and the men who were to manage its affairs had been chosen directly by the people whose servants they were to be. There had been no lack of candidates. Their abundance had proved that everybody was not working in the mines, driving ox-teams on the plains, or engaged in other occupations that could not have been unfixed at a day's notice. As the convention had named the candidates on one of the general tickets, the only remaining good chances for the surplus willing ones to participate in the new "government" were in the direction of the "Legislature;" and for places in that body there had been a fine scramble.

All this had been well done, under the circumstances; and by the great majority of those who caused it to be done, was well meant for a good and most important purpose. But it was not legal. The new "government" had no standing in law, and as a legal fact was destitute of authority. The "Territory of Jefferson" was still a part of the old Territories, and would remain so until Congress enacted otherwise.

Patriots in all places and in all ages have been subjected to unjust accusations in connection with political affairs. As to the "purity" of this "Jefferson" election Judge Wilber F. Stone presents the following evidence:

> "As Fountain City was the only important settlement south of the 'divide,' it must needs be looked after, and so Hickory Rogers was sent down from Denver to see that the right of suffrage was properly exercised. Si Smith had been previously appointed by the Governor of Kansas a Justice of the Peace, being therefore the first jurist that sat on the bench in the Arkansas valley, and he administered some of his oaths to the election judges, who proceeded to open the polls and receive the votes of the settlement, amounting to about seventy-five, all for the Jefferson government. The returns were duly certified and sworn to, and delivered to Hickory to take to Denver, which at that early day assumed to 'hog in' the capital. The first night out, old Hickory sat down and deliberately added 150 names to the poll-book. As the returns were properly sworn to there was no going back by the canvassing board on the population of Fountain City, and thus early in the history of the now proud Centennial State, did the honest American voters of the Arkansas valley vindicate the glorious boon of the ballot-box.

There was almost no end of vindicating the glorious boon of the ballot-box in the Pike's Peak country in 1859. Late in October, about the time the "Jefferson" constitution was ratified by the people, a movement was inaugurated here for holding still another election. It was prompted from eastern Kansas, and was the first positive assertion of Kansas authority the people here had encountered. On the 4th of that month the people of the Territory of Kansas had ratified what was known as the "Wyandotte Free State Constitution." The western boundary of the proposed State of Kansas had been fixed on the 102nd meridian, and that part of the original Kansas Territory lying west of that meridian—the Pike's Peak country—was to be cut off and continued as Kansas Territory, and to be provided with a Territorial Government made up, it was alleged, of eastern Kansas politicians who could not be provided with places under the proposed new State of Kansas. At the election to be held on November 8th, a full complement of State officers was to be elected; and this was the basis of the new movement here, though this part of the country was outside the limits of the proposed State of Kansas. Certain of the Cherry creek politicians, who very well knew the illegal character of the "Jefferson" proceedings, made this election the occasion for holding still another county election—the third in that year—and for choosing a representative from Arapahoe county in the Kansas Legislature. In this they were joined by a few of the citizens here in favor of remaining under Kansas jurisdiction and of respecting and obeying Kansas authority.

As may be imagined, this movement aroused the utmost indignation among all the Jeffersonians, and was denounced bitterly. The Rocky Mountain News emptied the vials of its wrath upon it, stigmatizing it as "a vile scheme;" appealed to the people to "let that 'election' pass without casting a single vote;" and branded it as a sham and a pretense under which a few men sought office and which would enable some eastern Kansas politicians to become rulers of the contemplated "sawed-off" Kansas Territory. With fierce vehemence the News thus repudiated the whole Kansas jurisdiction and the election about to be held under it:

> "What show of authority is there for ordering an election in Arapahoe county—Kansas never had a right to organize it—it is at best a farce; as well might she extend her jurisdiction, and organize a county on the coast of Africa as to legislate over Indian lands!"

However, the election was held on November 8th, but it was the merest form, the people having responded to the appeal of the News, and but few votes were cast. By that time the machinery of "Jefferson Territory" had been put in motion, and a very large majority of the people then considered its jurisdiction and the "laws" it had begun to formulate to be the only authority they should acknowledge, aside from the general laws of the United States. The only precincts appearing to have taken part in the election were "Henderson's Island Township," "Beaver Creek Township," Denver City, Auraria, and two or three of the Clear creek mining towns. The returns from the mining towns were delayed in reaching Denver beyond the limit prescribed by Kansas law, and therefore were not counted. The official returns showed that S. W. Johnson had received thirty-eight votes for Member of Congress from the proposed State of Kansas, and W. J. Parrott twenty-two. Of these sixty Congressional votes, thirty-three were cast in Denver City, and only three in Auraria. For Representative in the Kansas Legislature Captain Richard Sopris received the highest number of votes—219, to seventeen for David Gregory, the opposing candidate. There were two county tickets, but the winning one was elected by an average vote of about 250, to a few scattering ones—twenty-five or thirty—for the other candidates. Further particulars of this county election will be found in our historical account of Arapahoe county. Sopris took his seat in the Kansas Legislature and served his term as the member from Arapahoe. The authority of the county officers elected was soon asserted, as evidenced by "legal notices" published by them in the News as officers of "Arapahoe county, Kansas Territory," and the validity of the election was to some extent recognized by the "Jefferson Legislature" in its "act" approved December 7th "confirming the election of J. H. Kehler, Sheriff," who had been one of the officers chosen. In this mixed-up condition of public affairs it is not surprising to find it recorded that many of the people in the Pike's Peak country were hopelessly bewildered in their efforts to decide where they were "at," politically.

There is no record of any vote here on the Kansas State constitution, on October 4th, nor for State officers on November 8th. The constitution was ratified in Kansas by 10,421 to 5,530. Under it Kansas was finally admitted as a State on January 29, 1861; and a month later the Territory of Colorado was substituted for the proposed new Territory of Kansas in the Pike's Peak country.

Notwithstanding the suddenly precipitated assertion here of Kansas authority in the matter of the election of November 8th, "Governor" Steele and the other "Jefferson Territory" executive officers had been promptly installed in office. The constitution provided that the "Legislature" should meet at Denver on the first Monday in November, and that it might adjourn to any other suitable place; the session to be limited to forty days, Sundays included. Therefore, on November 7th the "Jefferson Legislature" met in Denver City in its first session. For the Council (or Senate) Henry Allen represented the Auraria district, and N. G. Wyatt that of "Denver City;" the other members of the Council having been W. D. Arnett, Eli Carter, James Emerson, Mark A. Moore, D. Shafer and James M. Wood. In the House of Representatives the Auraria district was represented by William M. Slaughter and M. D. Hickman, and that of Denver by John C. Moore and W. P. McClure; the other members having been J. S. Allen, William Davidson, A. J. Edwards, Thomas S. Golden, James A. Gray, C. P. Hall, J. N. Hallock, Z. Jackson, Edwin James, S. B. Kellogg, A. McFadden, Miles Patton, C. C. Post, Asa Smith, J. S. Stone, and David K. Wall. There was not a full membership in the House, as the records show it to have been short one Representative of the number provided for by the constitution. The "Legislature" organized by electing Henry Allen President of the Council, and James A. Gray Speaker of the House, and at once dived into legislation. "Governor" Steele sent it an excellent, conservative message full of good advice and worthy suggestions. Considering all the circumstances, and especially the haste and confusion in which its members had been chosen from the multitude, the "Jefferson Legislature" was a creditable body; and, indeed, the whole "Provisional Government" had in it the making of a fairly good government—far better than that of the average outfit bestowed in those days upon Territories from Washington.

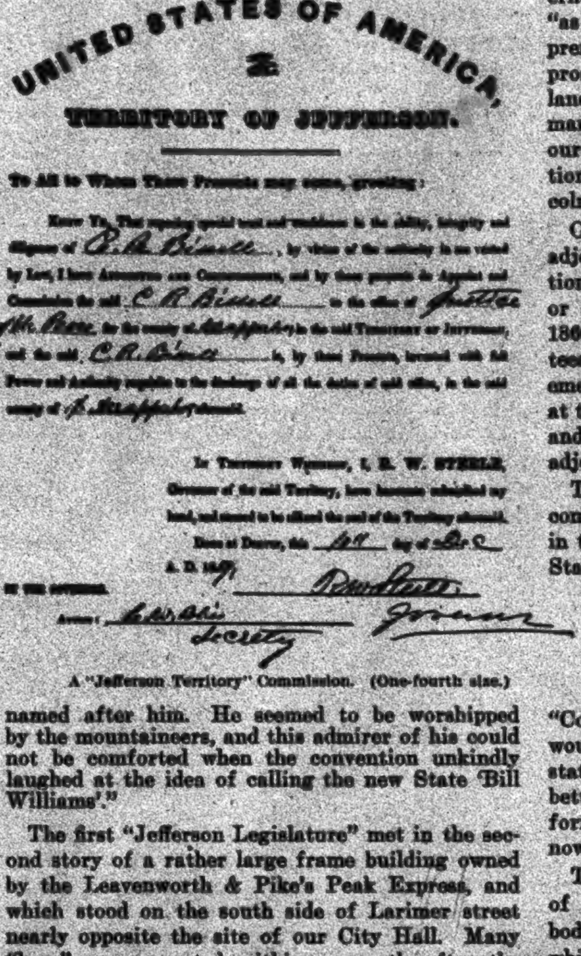
The Rocky Mountain News was a loyal supporter of the new, home-made establishment. From its "mast-head" it had at once discarded the legend, "Kansas Territory" and substituted that of "Jefferson Territory." Editorially it said in its first issue after the "Legislature" met:

> "We hope and expect to see it stand until we can boast of a million of people, and look upon a city of a hundred thousand souls, having all the comforts and luxuries of the most favored. Then we will hear the whistle of the locomotive and the rattle of trains arriving and departing on their way to and from the Atlantic and Pacific. * * * The future of Jefferson Territory—soon to be a sovereign State—is glorious with promise."

From the beginning here until Colorado Territory was finally organized there was a variety of opinion as to the name that should be given to the new National division destined to arise here in the west. This continued until Congress made the decision and bestowed upon the Territory of Colorado that distinctive and appropriate name when it organized the Territory in 1861; and which, fortunately, was not changed when the Territory became a State. In our account of the Territorial organization of Colorado elsewhere in this volume, other names suggested at that time are stated. We have already mentioned Governor Denver's prophetic suggestion that a new Territory would be needed in the Pike's Peak country, and which he contemplated calling "Shoshone." In these several "Jefferson" conventions some men proposed "Cibola," the Spanish word for buffalo, as a name for that commonwealth; others said "Pike's Peak" would be a suitable name, and cited "Rhode Island" as a precedent for such a choice; still others urged that it be called "Platte." But all of these met with little encouragement. Of other proposed baptismal names at that and a later time, Mr. William N. Byers, in a recent reminiscent article in the Rocky Mountain News, (February 23, 1899,) said:

> "We wanted our territory named Jefferson. Why? Because it was part of the great Louisiana purchase, effected by Jefferson in 1803; and not only did President Jefferson purchase this country, but he sent out the early exploration parties into it, like the Lewis and Clark, and others. This country was ever the object of his fondest hopes and confidence, and this State might with propriety and justice have been named after him.

But Congress would not have it so. They said no State should be named after a man, Washington alone excepted. They didn't consult us as to our wishes, but finally chose the name Colorado, the others under discussion having been Jefferson, Idaho and Montana. Colorado is a more euphonious and romantic name than Jefferson would have made, and none of us objected to it. But I have always thought that one State carved out of the great Louisiana purchase should have been named after Jefferson. When we started the movement for a State in 1859, and were discussing a name, one delegate from the mountains rose in the argument, and made an impassioned appeal in favor of calling the State 'Bill Williams.' Bill Williams was one of the earliest of the mountaineers. He seemed to be ubiquitous, for there were all sorts of places all over the mountains named after him. He seemed to be worshipped by the mountaineers, and this admirer of his could not be comforted when the convention unkindly laughed at the idea of calling the new State 'Bill Williams'."



UNITED STATES OF AMERICA,

TERRITORY OF JEFFERSON.

A "Jefferson Territory" Commission. (One-fourth size.)

The first "Jefferson Legislature" met in the second story of a rather large frame building owned by the Leavenworth & Pike's Peak Express, and which stood on the south side of Larimer street nearly opposite the site of our City Hall. Many "laws" were enacted within a month after the "Legislature" met; among them one defining the outlines of twelve counties, for nine of which, including Arapahoe, organizations were provided and for some of which "Governor" Steele appointed certain "officers" to serve until the regular county election on the first Monday in January, 1860, as provided for in the "act" creating the several counties. The Legislature appointed committees to prepare full civil and criminal codes and report them to a later session to be called by the "Governor" whenever these committees had completed their work and were ready to make their reports. Early in the proceedings a "law" had been enacted consolidating Denver City, Auraria City and Highland, under which an election of our "first city officers" was held on December 19, 1859. The "Legislature" levied a poll-tax of one dollar to defray immediate expenses, and on December 7th adjourned to await the readiness of the code committees.

By proclamation dated December 10th "Governor" Steele appointed Thursday, December 29th, "as a day of Thanksgiving and Praise to the Supreme Ruler of the Universe for our preservation, prosperity and happiness in this newly-discovered land of gold." The day was duly observed by many of the people. It has usually been held that our thanksgiving custom, by official recommendation and request, originated with President Lincoln.

On December 10th, also, three days after the adjournment, the "Governor" issued a proclamation calling the "Legislature" to meet in special, or adjourned, session in Denver on January 23, 1860, to act upon the reports of the code committees, and to provide such other legislation as the emergency demanded. The law-makers assembled at the appointed time and, after enacting the codes and several more but unimportant general "laws," adjourned without day on January 25, 1860.

The civil and criminal codes were quite full and comprehensive, but were, after the usual practice in those times, copied wholesale from those of the States and Territories. One of the factional "Legislatures" of Kansas had amplified this practice by taking the codes of Illinois and merely enacting that wherever the word "Illinois" appeared in them it was to be read, and construed to mean, "Kansas;" leaving the "Courts" to worry with the tangled details that would result from such an avalanche of borrowed statutes. "Governor" Steele's "Legislature" did better than that and put its "laws" into proper form, and had them published in a small volume now very rare and of great historic interest.

That "First General Assembly of the Territory of Jefferson" was a most industrious legislative body. In addition to the civil and criminal codes, which were approved by "Governor" Steele January 25, 1860, it accomplished much other general "legislation." The purposes of the various general "acts" are indicated in the following:

Defining the duties of Territorial officers; further defining the duties of the "Governor;" defining the qualifications of public officers; establishing a judicial system for the "Territory;" defining the duties of the Supreme Court; defining the duties of the District Court; regulating and authorizing writs of attachment and garnishment; to provide for the recovery of property by writs of replevin; for districting the "Territory;" defining the boundaries of counties; for the organisation of precincts and for the election of officers thereof; organizing County Courts and defining their jurisdiction; providing for the election of county officers and for other purposes; establishing the office of county Treasurer; for appointing Notaries Public and defining their powers and duties; for establishing, opening and repairing county roads and highways; providing for raising "Territorial" and county revenues and collecting the same; defining the manner of taking up farming and other claims; concerning irrigation; for a general incorporation law; to provide for the incorporation of towns; to prevent intentional firing of woods and prairies in the Territory; concerning enclosures and trespassing animals; regulating wills; to create mechanics' and other liens; regulating licenses; establishing Courts of Justices of the Peace; to provide for payment of certain officers, and regulating fees; to give legality to decisions of Miners' Courts, and of meetings for other purposes; to provide a docket fee in the District and Supreme Courts; regulating fees in certain cases; authorizing officers to use private seals; further defining the powers and jurisdiction of Courts in the "Territory;" to authorize the formation of military companies; defining judicial districts and times of holding Courts; confirming election of J. H. Kehler as Sheriff, and fixing the limit of his jurisdiction under the "Provisional Government;" to provide for the expenses of the "First General Assembly;" to provide for payment of warrants; to provide for the redemption of warrants; to provide for payment of Commissioners for the codification of the "laws"; providing the form of warrants; regulating taking up and posting of estrays; joint resolution providing for a "Territorial Seal," and for other purposes.

In addition to the foregoing "general laws" there were several "special acts" of that "Legislature." The most important one was that consolidating the Cherry creek towns into one municipality, the particulars of which are given elsewhere; the others were as follows, and some of them are still the basis of existing property-rights:

An Act to incorporate the South Platte River Improvement and Lumbering Company, with William A. McFadding, J. D. Henderson, J. C. Sanders, C. J. Stevens, and John Easter, as incorporators. Approved November 28th. This company was authorized to improve the South Platte river from Auraria City to a point twenty miles above the mouth of Platte canon, for floating timber, lumber, and so forth down the river.

An Act to incorporate the Consolidated Ditch Company, with the following-named persons as incorporators: W. Green Russell, B. F. Chase, J. M. Wood, R. W. Steele, C. R. Roberts, Wilkes DeFrees, A. H. Owens, Henry Allen, W. M. Slaughter, and G. W. Cleveland. Approved December 2d. The work of this company has already been mentioned.

An Act to incorporate the Arapahoe Ditch Company, with S. B. Allen, C. R. Harris, and H. H. Tomheart as incorporators, to construct a ditch from near Golden, along Clear creek to the mouth of Ralston creek. Approved December 7th.

An Act to incorporate the Denver Mutual Insurance Company, with the following-named incorporators: Amos Steck, R. B. Bradford, D. P. Wallingford, E. W. Cobb, William Davidson, Jones & Cartwright, Hunt & Clark, M. D. Hickman, and H. H. McAfee. Approved December 7th. This was Denver's first fire insurance company.

An Act to incorporate the Golden Gate Town Company, with incorporators as follows: T. L. Golden, J. S. Rogers, Charles Fletcher, H. S. Hawley, and W. G. Preston. To lay out and plat on six hundred and forty acres the pioneer town of Golden. Approved December 7th.

An Act to incorporate the St. Vrain, Golden City and Colorado Wagon Road Company, with John W. McIntyre, J. M. Ferrell, Harry Gunnell and Lucien W. Bliss as incorporators, to build a toll wagon-road from Fort St. Vrain by way of Golden to "Saratoga West" on the Blue Fork. Approved December 7th.

An Act to incorporate the Denver, Auraria and Colorado Wagon Road Company, with Joseph Casto, Horner Fellows, Christian Dorsey and Solomon Shrop as incorporators, to build a toll wagon-road from Denver City by way of the South Park, through Tarryall to "Saratoga West" on the Blue Fork. Approved December 7th.

An Act to incorporate the Cibola Hydraulic Company, of which J. W. McIntyre, D. C. Vance, D. McClery, A. McPhaeder, and F. B. Chase were incorporators. Approved December 7th. This company was authorized to dam Clear creek four miles above Golden City, and to convey water by a ditch to that town and adjacent camps.

An Act to incorporate the Boulder City, Gold Hill and Left Hand Creek Wagon Road Company, with T. J. Graham, E. D. Steele and William Pell as incorporators, to construct a toll wagon-road from Boulder City to Gold Hill and Left Hand creek. Approved December 7th.

An Act to incorporate a Wagon Road Company from Auraria and Denver Cities to the South Park, with J. H. Cochran, Samuel Brown, and Joseph M. Brown as incorporators, to build a toll wagon-road from Auraria by way of Piedmont to the South Park. Approved December 7th.

An Act to incorporate the Fountain City Bridge Company with William H. Green "and associates" as incorporators, to build a toll bridge across the Arkansas river at Fountain City (Pueblo). Approved December 7th.

An Act to incorporate the Clear Creek Lumbering Company with John C. Wall, John E. Carter "and their associates," to improve Clear creek by dams and chutes for driving timber and lumber. Approved December 7th.

It was easy enough for the "Jefferson Legislature" to enact "laws," but enforcing them by its authority-lacking executive officers, against those who offered any resistance, was quite another matter. On January 2, 1860, the day appointed by the "Legislature" for local elections in the several counties it had defined, the voters of "Mountain county," embracing the upper Clear creek districts, held an election to decide whether there should be such a county, or not; notwithstanding that the "Legislature" had already enacted one into existence there. The vote was ninety-five in favor of, and 395 against, the county proposition. So, that was practically the last of "Mountain county;" and as if this were not enough, the rebellious miners up there joined in a protest, signed by between six hundred and seven hundred of them, against paying the poll-tax of one dollar, and sent it down to "Governor" Steele; thus cutting off at one slash their large proportion of the sinews of war and politics.

Much the greater part of the fealty to the "Jefferson government" existed in Denver and the other towns out of the mountains. While the mining camps had participated in organizing it, a large majority of the miners preferred the short, sharp and effective government afforded by their own Courts, and which they continued to maintain. But in the "valley," as the plains along the foot-hills were then often called, "Jefferson" received the moral, and in most respects the unreserved, support of a large majority of the people for several months, and until its inherent impotency became too plain for even its most ardent partisans to deny. Its "laws" could not acquire enough momentum in the confidence of the general public to get away from under the cloud of illegitimacy that gradually lowered upon them. The Denver City consolidation "act" acquired as much vitality as any other product of the "Jefferson Legislature." A city government was organized under it, because it was the most available "authority" at hand; and made a promising beginning under whatever virtue the "act" carried. But that city government broke down far inside of a year, and the consolidation of the towns had eventually to be done over again by the first Legislature of Colorado Territory. Through it all, the authority of the county officers elected under Kansas jurisdiction on November 8, 1859, was recognized by practically all of the people here when it came to the more serious affairs, such as pertained to real estate titles and technical legal questions. While nearly all the men directly interested in the Cherry creek Town Companies actively participated in the proceedings that resulted in the organization of "Jefferson Territory," the companies, as such, never recognized it. In all their transactions they kept within "Arapahoe county, Kansas Territory," as shown by their old records, their deeds and their town-lot certificates. Our researches in the preparation of this work revealed no instance of a local transaction in real estate in which the property involved was described as having been situated in "Jefferson Territory."

Nevertheless, the "Jefferson" Courts started off with considerable prestige and for a few months transacted the bulk of the business outside of the mining camps. Yet their jurisdiction had to be divided with rival establishments. The Miners' Courts jealously maintained themselves in the mountains, but here in the "valley" there was a sort of joint but mutually hostile occupation by the jurisdiction of Kansas Territory and of "Jefferson," with neither very firmly established. Then the Arapahoe County Claim Club went into the business independent of all Territories, and in the autumn of 1860 the city of Denver under a new "Provisional Government" of its own contriving, set up an Appellate, and a Common Pleas Court with facilities for doing business claimed to be superior to those of any of the others. Commenting on these unique conditions of jurisprudence, Hollister, a participant in some of the legal proceedings and a victim thereof, says:

> "Such as felt friendly to one, patronized it with their business; and so of the others. Sometimes changes of venue were taken from one to the other, and between them litigants were well fleeced, at least."

An election for "county officers" for Arapahoe as defined by the county-making "act" of the "Jefferson Legislature," had been held on the day appointed, January 2, 1860, as had been authorized and directed by the "Jefferson" "law". Only a County Judge, Recorder, Treasurer, and Attorney were elected, and the last-named three were the same men chosen for the same places at the election of November 8, 1859, under Kansas jurisdiction. So, County Attorney Collier, for example, was in a position to accommodate both preferences as to jurisdiction. He could prosecute under that of Kansas or that of "Jefferson" as circumstances might require.

In the civil code of "Jefferson Territory" was a provision with relation to persons competent to testify in the courts, that now reads like a scrap of history far more ancient than it really is. Section three hundred and seventy-eight reads like this:

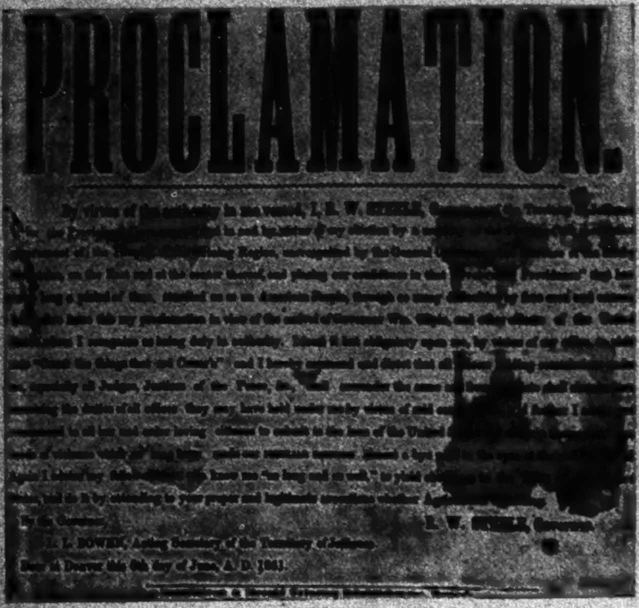
> "Every human being of sufficient capacity to understand the obligation of an oath, is a competent witness in all cases, both civil and criminal, except as otherwise herein declared. But an Indian, a negro, or mulatto or black person shall not be allowed to give testimony in any cause."

The ballot was also denied to Indians, and to "negroes, mulattoes or black persons."

The license system of "Jefferson Territory" put a special tax on every occupation except those of farming and mining. Merchants, gamblers, showmen—all of them were included. On storekeepers the tax was one-fourth of one per cent on all merchandise offered for sale that was "not the growth, manufacture or product of the 'Territory'"—a home-made protective tariff. The tax on gamblers was two dollars and fifty cents per month "on each table or other appliance used for gaming." This was an open, specific licensing of gambling.

The last act of the first "General Assembly of Jefferson Territory" was the joint resolution providing for a territorial seal. The seal was to be two inches in diameter, the device and legends to be as follows:

"The Rocky Mountains to appear in the distance, at their base the foot plains reaching and covering the foreground of the same, on which an emigrant wagon is to be shown with emigrants carrying mining tools; with an inscription around the edge of the same (surrounding the above engraving) 'The Great Seal of the Territory of Jefferson;' and in the upper side of said circle to appear the words, 'The people are the government.'"



PROCLAMATION.

Abdication of "Jefferson Territory."

The proposed historic symbolism of the seal was appropriate and striking, but they appear not to have obtained their seal, nor did they ever have much use for it.

The twelve counties into which the "Legislature" divided the enormous area of "Jefferson Territory," were Arapahoe, Cheyenne, El Paso, Fountain, Jackson, Jefferson, Mountain, North, Park, Saratoga, Steele, and St. Vrain. Some of these names are retained in those of Colorado counties, but the boundaries of the old divisions are not preserved in any of them; therefore, we did not deem it important to state here their carefully specified definitions. Each was large enough to make a fair-sized State, yet few of them ever attempted to perfect county organizations under the "Jefferson" jurisdiction.

Within six months after the "Territory of Jefferson" and its "government" had been organized, the entire establishment betrayed much debility, both in itself and in the estimation of the people; and steadily grew weaker toward the autumn of 1860. Not entirely disheartened by the situation, "Governor" Steele on September 18th issued his proclamation from Denver, the "Territorial capital" for an election of "Territorial officers" and a "Legislature" on October 22nd, the constitution having provided for annual elections on the fourth Monday of that month. The proclamation concluded with the following frank warning:

"All persons who expect to be elected to any of the above offices should bear in mind that there will be no salaries or per diem allowed by this Territory, but that the general government will be memorialized to aid us in our adversity. All officers whose fees are fixed by law will, of course, receive them as therein directed."

An alleged census of "Jefferson Territory" was taken at that time, and which accorded it a population of 48,000. This enumeration was a very questionable one in every way, and it is extremely doubtful if there were then two-thirds that many people in the whole of the vast area of the "Territory," for the portentous news of events and impending events in the States had caused thousands who might otherwise have remained here to return to their former homes.

At the election on October 22nd "Governor" Steele and several of his associate "Territorial officers" were re-elected, the complement chosen having been R. W. Steele, Governor; L. W. Bliss, Secretary; C. R. Bissell, Auditor; Samuel McLean, Attorney General; J. B. Smith, Chief Justice; William Brackett and C. C. Post, Associate Justices; and R. Borton, Marshal. Members of the "Legislature" were claimed to have been elected in nearly all of the counties, but whether they were or not was not at that time a matter of great public interest. The total vote was very small, that for "Governor" having been the larger—983. By that time outright opposition to further attention to "Jefferson" had arisen, and it had become especially strong in Denver in consequence of the "Jefferson government" having recently come into conflict with the city's new "Provisional Government" of its own making. On October 22nd a vote, not authorized by the proclamation of the "Governor," was taken on the proposition to at once abandon "Jefferson" and let it pass into oblivion. In Denver alone 795 votes were cast in favor of so doing, as the city thought her new "Provisional Government," of which we elsewhere give some account, far the better of the two.

The "Second General Assembly" met at Criterion Hall, in Denver, on November 12th. "Governor" Steele sent it an excellent message, but the hand of death was upon it. It had extreme difficulty in getting and keeping a quorum, and in the excitement over the Presidential campaign in the States, and over the startling news of threatened secession in the south, the "Assembly" commanded little public attention. It accomplished some "legislation," and on November 27th adjourned to Golden City, the principal inducement for doing so having been, according to the News, that "board is offered at six dollars a week—wood, lights, and hall rent free." As these law-makers were serving without pay, the Golden City attractions were persuasive. At Golden the "Legislature" dragged out the remainder of the forty days' session with barely a quorum. Members were indifferent and had lost all interest in the proceedings, which had by that time become mere playing at law-making. So, the second and last of the "Jefferson" "Legislatures" passed away.

However, it had made one heroic effort to revive public interest in a new movement for the immediate organization of the "State of Jefferson." By an "act" approved December 12, 1860, provision was made for holding a convention to prepare a constitution for the "State of Jefferson," but the proposition was not favorably received, and nothing came of it. It was then confidently expected that Congress would soon settle the matter of a government for the people here; which it did in less than three months after that last and rather pathetic endeavor to make the Pike's Peak country the "State of Jefferson."

"Governor" Steele and his associate executives bravely, though nominally, held on until the Territory of Colorado came into existence. Steele was a pioneer of the spring of 1859, and a man of ability and strong force of character. Born near Chillicothe, Ohio, June 14, 1820, he removed to Fairfield, Iowa, in 1846 and there studied law. Entering the Cincinnati Law School, he was graduated in 1852, and then located in Indianola, Iowa, where he practised until 1856 when he removed to Florence, Nebraska, and became a member of the Nebraska Territorial Legislature of the winter of 1858-59. Coming hither in 1859 he proceeded to Mountain City (Central City) where he engaged in law practice, mining and other enterprises. After "Jefferson Territory" abdicated he was engaged in mining in the upper Clear creek districts until 1865, when he returned to the States. Coming back to Colorado in 1878, he resumed mining and continued in it some ten or twelve years, and then settled at Colorado Springs where he lived in retirement until his death on February 7, 1901.

"Jefferson Territory" made its last gasp in June, 1861. On the 6th day of that month "Governor" Steele issued from Denver a proclamation announcing the arrival of Governor Gilpin, and the institution of the government of the Territory of Colorado under the act of Congress signed by President Buchanan February 28, 1861. In his proclamation "Governor" Steele said:

> "I deem it but obligatory upon me by virtue of my office to 'yield into Cæsar the things that are Cæsar's,' and I hereby command and direct that all officers holding commissions under me, especially all judges, justices of the peace, etc., etc., shall surrender the same, and from and after this date, shall abstain from exercising the duties of all the offices they may have held, and yield obedience to the laws of the United States, and do it by attending to their proper and legitimate avocations whether agriculture or mining."

Thus ended the most interesting and picturesque endeavor of an isolated community to establish and maintain within itself a government of and by law, that the student of self-government will find in the history of this country. In any other country and among any other people it would have been impossible. The old Tennessee "State of Franklin" bore some resemblance to it; the embryo provisional government of Oregon was nearer like it; an attempt in the old Territory of Dakota had something similar in view. It is true that in June, 1861, the "Jefferson" Cæsar had little left to render his successor; but, considering all of the circumstances and conditions that had brought "Jefferson" into existence, and that had afterward surrounded "Governor" Steele and his "government," and the really great service it had been to the people in many ways, in the emergency, he conveyed to Governor Gilpin the memory of what may properly be termed the conspicuous political romance in the history of the United States.

CHAPTER XXXIII.

CONSOLIDATION OF THE CHERRY CREEK TOWNS BY THE "JEFFERSON LEGISLATURE"—ELECTION OF CITY OFFICERS—RATIFICATION OF THE UNION BY CITIZENS—ENCROACHMENTS ON CHERRY CREEK—S. W. BEALL'S MISSION—S. S. CURTIS' REMINISCENCES—SECOND DUEL—BROADWELL HOUSE—FIRST FIRE—TRANSACTIONS OF THE TOWN COMPANIES—DENVER CONDITIONS IN 1860—CHANGED ROUTE OF STAGE LINE—FIRST DAILY PAPER—"COLORADO" JEWETT—SCENES AT STAGE STATION—FOURTH OF JULY, 1860.

The second winter at Cherry creek had been quite different from the first. Instead of two little groups of forlorn cabins cut off and shut out from the world, the combined population made a town of considerable size. Twelve months before, the fate of the settlements had been discouragingly uncertain, and they had had little but hope to sustain them; now, there was no limit to their ambition. This second winter was not one of isolation. The overland coaches made their trips without much delay or hindrance, though less frequently, and maintained communications with the Missouri river with fair regularity. Business went on briskly, many improvements being made, with preparations for many more in the early spring.

The somewhat comical rivalry and animosity that had existed between the two "de facto" Cherry creek towns from the time of their birth had been sensibly abating through the autumn of 1859, and the proper, reasonable and judicious proposition that the two places be consolidated, was then seriously and earnestly discussed by the more conservative citizens of both towns. It was proposed that Auraria and Denver unite in establishing a stable city government capable of maintaining law and order, and protecting life and property. The town of Highland at that time existed only on paper.

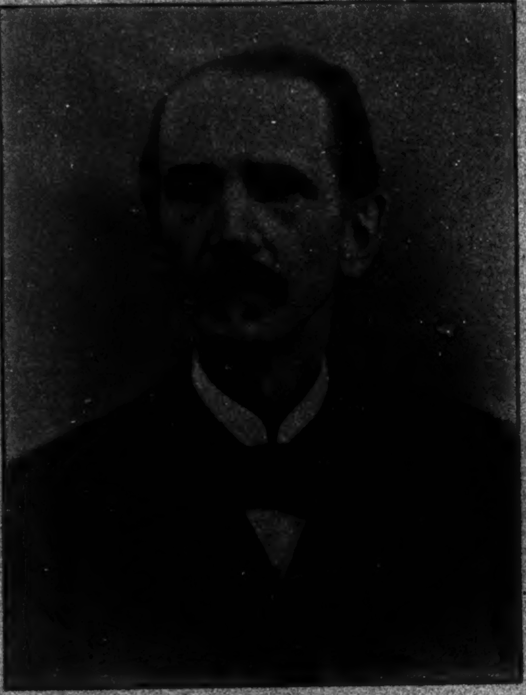
While these matters were informally under consideration by the people, the first "Legislature" met in Denver in its first session. As already related, among its "acts" was one passed and approved December 3rd, consolidating the three towns into one municipal organization, under the title "City of Denver, Auraria and Highland."

Under the "authority" conferred by this "act" an election was held on December 19, 1859, to choose the first Mayor and other city officers. John C. Moore was elected Mayor, and on January 21, 1860, sent his first message to the City Council, which held its first meeting on that date.

While in one sense this was the beginning of the municipal government of Denver, it was not so as a legal matter of fact. It was the first election of city officers, and was duly and regularly conducted under the forms of "law." So far as the actions and purposes of most of the citizens were concerned, the election was assumed to have full force and effect; but having been held under authority conferred by the Provisional government of "Jefferson Territory," it had no better standing in law than had the source from which it derived its power, which was none at all. It was a Provisional city government without power to enforce its ordinances if opposed by legal processes under the laws of the Territory of Kansas. However, it was far better than no city government, just as the Territorial organization of "Jefferson" was better than anything else that was practically available at that time. This original city government served a good purpose for several months, and the fact that the first Legislature of the regularly constituted Territory of Colorado enacted the first legal city charter for Denver, does not detract from the utility, importance and historical interest associated with this municipal organization.

The action of the Provisional Legislature in consolidating the three towns, and the election held under it, crystallized public sentiment on both sides of Cherry creek in favor of making the union more definite and complete by dropping part of the "statutory" name, and simplifying it by calling the consolidated municipality the "City of Denver." With that end in view a meeting of the citizens of Denver and Auraria was held on December 26, 1859, and the conference resulted in a conclusion to do so.

The matter thus rested without definite and final action until the following spring, when it was taken up by the Aurarians. During the last week of March, 1860, a mass meeting of the citizens of Auraria was held in that town to decide the question. After considerable discussion the following was submitted by Andrew Sagendorf, who is still with us, and adopted by the meeting:



Andrew Sagendorf.

"Whereas, The towns at and near the mouth of Cherry creek are, and ought to be, one; therefore, be it"

"Resolved, That from this time, Auraria proper, shall be known as Denver City, West Division, and we hereby authorize the board of directors to change the name on the plat, accordingly."

Mr. Sagendorf's proposition further provided that Auraria should reserve the right to make its own municipal regulations, to maintain its organization as a town company, and to hold the title to the town site, as before; this as a safeguard against the invalidity of the "charter" from the "Jefferson Legislature" consolidating the towns.

Before adoption, the proposition was amended upon a motion by A. R. Steinberger which authorized and directed an election to be held on Monday, April 3, 1860, to give all the people of Auraria opportunity to vote on the question by ballot. The election judges were S. B. Allen, J. N. Bradley and Charles L. Dahler; the result was a majority of one hundred and seven in favor of the proposition; the vote having been 146 to thirty-nine.

A short time before this Auraria election, the first bridge across Cherry creek had been completed at Larimer street, directly uniting the two towns. It would not now be considered a great construction, but it was then, and an important public convenience, as well. On the evening of Thursday, April 6th, a public meeting of the citizens of the two towns, the hearts of which were thenceforth to beat as one, was held by moonlight on that bridge to ratify the result of the election, to exchange congratulations, to rejoice over the marriage, and to listen to the inevitable speeches, without which nothing of a public character is considered properly done anywhere in this dear land of ours. The meeting was presided over by Judge N. G. Wyatt; and A. Jacobs acted as its Secretary, though he had but litttle to do. It adjourned with three big cheers for Denver City, proposed by General William Larimer, Jr., who was the prophetic orator of the evening. So, Auraria, with its pretty name and its picturesque career of eighteen historic months, passed away and became a most interesting memory.

At that time some buildings had been constructed in the creek's bed, and within the next two or three years many more were built there, and the stream almost ceased to be a dividing line. The original surveys had respected the creek, but later both town companies claimed the sandy trough, platted lots in it, and gave deeds for them. This afterward resulted in a large and interesting crop of lawsuits between rival claimants. But the creek in 1864 taught all of them a severe lesson, for it

---

Andrew Sagendorf who was conspicuously instrumental in bringing about the consolidation of the three Cherry creek towns and making them the City of Denver in name, as they had been in fact, is a native of the State of New York. Born August 26, 1828, he removed to eastern Nebraska in 1856, and was a citizen of Omaha at the time he caught the "Pike's Peak fever" early in the autumn of 1858. His journey across the plains terminated at Cherry creek November 8th of that year. He engaged in placer mining along the Platte and on upper Clear creek, and at the close of 1859 became Secretary of the Auraria City Town Company in which he had interests of some magnitude. In 1863 when the government bought and took possession of Clark, Gruber & Co.'s premises for the purposes of a "Mint," he was appointed Weighing Clerk there. Later he became Private Secretary to Governor John Evans, and Deputy Collector of Internal Revenue. In December, 1865, he was appointed Postmaster at Denver, a position he filled until June, 1869, when he resigned on account of ill health. Subsequently he received the contract for erecting the government buildings at the White River Ute Agency, and after completion of that work he was for several years engaged in stock-raising in Douglas county. He then removed to Colorado Springs where he established himself in the drug business and resided about ten years. Returning to Denver in 1884, he became Registrar of the State Board of Land Commissioners, serving six years. Since 1884 Mr. Sagendorf has continuously been a citizen of Denver, and true to his pioneer preferences has his residence on what was once part of the ample land-area claimed by the Auraria City Town Company. As the reader will have seen in this note, and elsewhere in this volume, Mr. Sagendorf has been a prominent figure in the history of Denver. —J. C. S.

asserted its ancient rights and washed out, in a whirl of watery wrath, the lots, the lawsuits, the improvements, and everything else that stood in its way.

The energy and ambition of Denver's pioneers had been fairly reflected in an action of the Denver Town Company's Directors late in December, 1859. We copy from their record:

> "By order of the President a Special Meeting of the Board was called on Tuesday, December 27, 1859, when the following gentlemen were present: Williams, Lawrence, Blake, Steck, Curtis, Peers, and Whitsitt. When the President read a letter from S. W. Beall in relation to our interests in Securing Specific Objects at the National Capital."
>
> "When after a lengthy discussion the following Resolution was offered by C. H. Blake. Resolved, by the Denver City Board of Directors That there be and is hereby donated to the Hon. S. W. Beall one original Share in Denver City. It being understood in making Said donation that the Donee shall proceed to Washington City and represent the Special interests of Denver City in the National Capital During the present Session of Congress and before the Heads of Departments in the location of a post office also the Indian agency, Military posts and an Essay office and any other matters that he may be requested to attend by the Citizens of Denver."

This resolution was adopted and a committee consisting of the President, Secretary, and Judge N. G. Wyatt who was the Town Company's attorney, was appointed "to draw up a Contract With S. W. Beall in relation to his agency in representing Denver City." The committee did this and Governor Beall went to Washington.

On the 1st of January he had prepared a memorial to Congress reciting the circumstances of the settlement of this region and setting forth in concise terms its then existing needs. The memorial was signed by nearly all the citizens of the two towns here, and its publication in the Rocky Mountain News brought many requests from citizens elsewhere to have their names attached to it. Governor Beall labored faithfully at Washington, but conditions and circumstances there were much against him. He reported progress within a couple of months, and on March 12th the Directors instructed the Secretary to reply "approving of his course."

One of Beall's propositions to Congress was that an enabling act should be immediately passed authorizing the people here to organize a State government; but in the event of such an act not being passed, to provide that if the Pike's Peak region, on July 1, 1860, contained thirty thousand inhabitants, a Territorial government should be established; and if, on September 1, 1860, the region should contain one hundred and fifty thousand people, a State should at once be organized. While the proposition was not acted upon, it certainly demonstrated the supreme confidence the pioneers had in the country's future, and was the most unique one ever submitted to Congress.

While Beall was not successful in getting all he went for, his services were valuable and important in impressing upon Congressmen and "Heads of Departments" the necessity for government attention to the new community isolated in the Far West. The mail facilities came in the following summer, and Territorial government the next year. While it is not to be said that the Territory was one of the results of Beall's mission, his services at Washington were influential to that end.

Of his experience here in these times and of circumstances that terminated in his appointment as the first Republican Postmaster of Denver, S. S. Curtis relates:

> "During the winter of 1859-60 I occupied as a store the half of the first floor of a two-story frame building on the east side of Ferry [Eleventh] street, nearly a block north of where Larimer crosses it. Buddee & Jacobs occupied the other half as a liquor store, and the second floor was used as a lodge-room by the Masons and the Odd Fellows. Pike Vasquez, and with him Jim Beckwourth, occupied the next building to the south of us, and Dave Moffat was in the next building with his stock of stationery. In the fall of 1859 I had purchased some claims in Pleasant Valley—the lower end of Russell Gulch—and in the spring of 1860, I closed out my stock of merchandise and went to mining. I made enough during the ensuing summer to pay out for my claims—$2,800—but just as I had commenced to make a profit for myself the Consolidated Ditch was finished and I was covered up with tailings from Missouri Flats, and had to quit at a loss of several hundred dollars. I came down to Denver that fall very much discouraged, very much in debt for a young fellow of twenty-two, and hardly knowing whether I could raise enough on my Denver property to carry me through the winter, the current rate for money then being from fifteen to twenty-five per cent. per month. However, I messed with Tom Bayaud on credit during that winter, and on March 7th was made Postmaster at Denver, receiving appointment No. 1, the first made by a Republican administration."
>
> "I opened the Post Office in a two-story brick building on the north side of Larimer street between E and F [Fourteenth and Fifteenth] streets using one-half of the ground floor for post-office purposes, while Dave Moffat used the other half for a news depot and stationery store. Up stairs, Moffat, George Kassler, John Ming, Clarence Clark and myself had our sleeping rooms, and General Case had the Surveyor-General's office. I had at different times John S. Filmore, I. W. Stanton, S. I. Lorah, and George Billings in the Post Office, all of whom rank among the prominent men of the present or of the past in Colorado."

David H. Moffat and Clarence Clarke had arrived early in that spring, March 17th, 1860, with a small stock of books, stationery and cigars, and, as Mr. Curtis states, began business on Eleventh street, in Auraria. When they moved over to the east side of Cherry creek their stock of goods did not seriously crowd Mr. Curtis' Post Office room. Their business also included that of a "news depot," and the store became a favorite evening stopping place for most of the business men of the town. This was the beginning of Mr. Moffat's business career in Denver.

In March of this year of 1860 the second duel in Denver was fought. This one had a tragic and much deplored ending, as it terminated the life of a capable and useful man. The late J. M. Broadwell, related to us that on the evening of March 5th he gave a dinner or banquet at the Pacific, or Broadwell, House, to which he invited many of the prominent men of the town and vicinity. Some other accounts state that the dinner was given by a "Mr. Conklin." In proposing a toast, L. W. Bliss, an ardent anti-slavery man, Secretary of the Provisional "Territory of Jefferson," and at that juncture its "acting Governor," made some remarks which Dr. J. S. Stone construed and believed to be offensive personal allusions to himself. A political and personal wrangle ensued between the two men which resulted in a glass of wine being dashed in Dr. Stone's face. Dr. Stone was Judge of the Miners' Court for the "Mountain City" District, and also its Member of the Provisional Territorial "Legislature"; and a man of extreme southern views. Brooding over the insult he had received, he challenged Secretary Bliss. Mutual friends endeavored to adjust the difficulty and prevent such an encounter, but the matter had now gone too far to permit their efforts to be of avail. The meeting occurred on March 7th at 3 o'clock in the afternoon, on the northward side of the Platte river near the end of the present Fifteenth street bridge. According to the usages of the barbarous code to which hundreds of good men sacrificed their lives, the choice of weapons fell to Secretary Bliss. He named shotguns loaded with ball, which were used at a distance of thirty paces. At the first fire Dr. Stone fell, mortally wounded in the groin. He lingered in great suffering until the following autumn, when he expired on October 10th. This tragedy which reveals so much of the social ideas and conditions of those times, made a profound impression upon the community, and was accompanied by a deep sorrow for the man whose life had been stricken down in the so-called "affair of honor" in which he sought that other figment called "satisfaction due a gentleman." In the ethics of such homicides, Secretary Bliss was held blameless for his part in this one. Dr. Drake McDowell had general charge of the arrangements, while E. W. Wynkoop acted as Bliss' second and W. H. Bates for Stone. A great crowd witnessed the tragedy.

The Broadwell House, later re-named the Pacific House, and still later given its original name, was built in the winter of 1859-60 by James M. Broadwell, who came to Denver in April, 1859. It had been completed only a short time before this tragic affair between Bliss and Stone. Its builder died at his ranche seventeen miles down the Platte, April 17, 1900, in his seventy-third year. His hotel was long the principal one in town. It was originally a good-sized two story frame structure that was raised to three stories in the "Seventies," and stood at the corner of Larimer and Sixteenth streets on the site of the present Tabor Block, to make place for which it was torn down by H. A. W. Tabor. In its time it was a noted hotel. When it was built most of the entire town was arrayed along Lawrence, Larimer, Market, Blake, and Wazee streets for several blocks on each side of Cherry creek, with the open prairie almost bordering on Arapahoe on the east side. Notwithstanding the richness of the Clear creek "diggings," so little confidence was felt in the future of the city by many citizens, that James Broadwell was told more than once while he was building his hotel that he was throwing away his money; and some went so far as to predict to him that antelope would be grazing in the streets of Denver within three years.

On March 18th the first serious fire in the Cherry creek towns occurred. A large new frame livery stable owned by Summers & Dorsett, and located in Auraria, on Twelfth street between Market and Wazee streets, caught fire in some unknown way and was totally destroyed, entailing a loss of about eighteen thousand dollars. The town at that time had no means of extinguishing fires except such as could be improvised by men with buckets, and this one caused great alarm; for the buildings were nearly all dangerously combustible wooden structures.

Few of the transactions of the Denver Town Company's Directors after 1859 were of noteworthy importance. Accounts of some of them appear elsewhere in this volume, and of the others, including those occurring up to the termination of the entries in the old record, in March, 1861, we will make here a brief summary.

On January 2, 1860, the Directors resolved "That the Independent order of odd-fellowship be donated two lots provided they build a house in Denver City in 6 months from this date." On January 9th "Mayor" John C. Moore and Sam D. Hunter petitioned the Board for a lot subsidy for building their proposed theater, and had their petition laid on the table. The Bayaud bridge was still unbuilt, notwithstanding that it had been bargained for in the previous autumn. At this meeting of January 9th the "committee on bridge reported that nothing final had been done." Whitsitt was then authorized to make new terms with Bayaud and have the bridge built, "provided he build the same for 250 lots and $750 cash, one-half on completion and one-half on acceptance of this proposition." This was not satisfactory and the bridge scheme continued to drag. On January 26th Whitsitt was instructed to close a contract with Bayaud "on the most favorable terms" he could make. This resulted in a new contract on March 3rd under which Bayaud built a bridge across the South Platte at the foot of Fifteenth street, completing it before the 1st of May.

Of the conclusion of this deal for building the bridge S. S. Curtis relates for us the following:

"As I had again become connected with the Denver Town Company, I was on a committee to settle with T. J. Bayaud for building a bridge over the South Platte river at the foot of Fifteenth street. After many evenings, and drinking many of his whiskey punches, we finally reached a settlement, paying him largely in town lots which passed into the hands of Charles Heidsick, and are still held I believe by him or his heirs. I formed a strong friendship for Mr. Bayaud, as I believe he did for me, which continued until his death; and I still regard him as having been one of the best of the remarkably large number of very bright men who were brought to Denver by a love of adventure in those early days."

On Larimer street in autumn of 1860—Arrival of a steam boiler hauled from the Missouri river by five yoke of oxen.

Notwithstanding that desirable building lots in the business sections of the city had brought comparatively high prices, others less favorably located commanded but moderate figures. Captain George L. Sanborn, now living in Park county, relates that he bought that spring eight lots on the north side of Curtis street, between Fourteenth and Fifteenth streets, for one hundred and thirty-five dollars, Curtis then clearly marking the division between town and country. He afterward sold them to J. H. Filmore for a spring-wagon, two span of mules, and four hundred dollars in money; and congratulated himself upon getting rid of his Curtis street real estate at such exceptionally good values.

The need for a good theater in Denver early became apparent, and Mr. W. N. Byers came near being a pioneer builder of one. In the old record of the Auraria Town Company, under date January 9, 1860, we find the following:

"Board received a petition from Byers & Co. to build a theater building and asking for a donation. Referred to a committee consisting of Sagendorf and Pollock with power to confer with petitioners, and obtain specifications &c, and report at next meeting."

The next meeting was held on January 16th when the following cautious action was recorded:

"On motion W. N. Byers & Co. were donated Eight lots with the condition that eight more be donated if that number be left after paying the debts of the Co. on condition that Byers & Co. built a theater in Auraria."

Hunt and Pollock were appointed a committee to make a contract with "Byers & Co." in accordance with the Board's action. However, other matters claimed Mr. Byers' attention, the arrangements were not concluded, and the Byers Theater was not built.

One transaction of the Directors, at that time, would seem to indicate the low valuation placed on some town lots in 1860. On March 3rd they resolved "that in consideration of Messrs. Fosdick and Cheever presenting the Company one of their Lithographed Maps of the Consolidated Cities, We hereby donate to them the West 25 feet of lot 9 in

Block 71 and release all right to the fraction running into the same." This ground given in exchange for a "present" costing a few cents, is situated on the south side of Larimer street next to the Cherry creek bridge entrance, and is occupied by present buildings numbers 1334 and 1336.

The Directors had ordered new books in which to transcribe records of lot-owners, and to bring accounts of real estate transactions into still more systematic form. Whitsitt did the work, and in payment for it the Directors voted him the share of the unhappy Brindle which they had confiscated the previous autumn. On April 17th the Board directed that "F and G streets be cleaned, all obstructions removed, and a good road graded and made on both streets to the bridge." On May 22nd the company held an election for Directors and elected A. J. Williams, J. R. Jones, Amos Steck, Richard E. Whitsitt, Samuel S. Curtis, Charles H. Blake, and Philip Peers. The Directors made A. J. Williams President, and re-elected Whitsitt Secretary and Treasurer. On June 25th "The Board instructed the Secretary to request Fox Diefendorf, Esqr to take the Census of the City of Denver between the 10th and 25th of September A. D. 1860." It was under this census—an elastic one—that four thousand, seven hundred and forty-nine inhabitants were counted in Denver City.

On August 18th the Directors agreed to give the Missouri and Western Telegraph Company a subsidy of fifty lots upon completion of its proposed line to Denver, but the line was not built by its projectors. On the same day they donated James T. Coleman ten lots as a subsidy for his Democratic newspaper. After that no meetings were held until the following February (1861). In the meantime George Wynkoop had obtained judgment for a relatively large sum against the company which on February 1st was compromised by transferring to him several blocks of lots and paying him two hundred and fifty dollars in money. At this time the Directors also had to reckon with Brindle whose share they had previously taken from him, and twenty-five lots were transferred to him in settlement of his claims.

The Wynkoop case was a locally famous one in its time, and the circumstances out of which it grew are worthy of record. The reader will recall that the Denver Town Company after having taken possession of the "St. Charles" town site, sent E. W. Wynkoop to the capital of Kansas Territory to have the Denver Town Company incorporated. Such things then had to be done by a special act of the Territorial Legislature. Wynkoop was also authorized to transact other details of the company's business at the Territorial capital, and was made a sort of general agent for the Denver Town Company. When Wynkoop arrived at the capital he found the Legislature in session, with a bill before it to charter the "St. Charles" Town Company which claimed the same town-site. Wynkoop opposed the passage of this bill and tried to procure in its stead the passage of a bill for his own company. To further his purpose, he as agent of the Denver Town Company, offered his brother, George Wynkoop, then a resident of Lecompton, an original share of Denver Town stock if he would use his influence in the Legislature to defeat the "St. Charles" bill and secure the passage of the Denver Company's bill. The offer was accepted, but the labor was in vain. The "St. Charles" bill passed and became a law. George Wynkoop applied to the Denver Company for his share of stock and it was refused him, the company repudiating the acts of its agent, E. W. Wynkoop. George then instituted suit in the "Jefferson Territory" District Court, alleging the validity of his claim and that he had been at great expense of time and money in endeavoring to forward the interests of the Denver Town Company. He was given a judgment for eleven hundred and seventy-five dollars. Judge A. J. Allison, Chief Justice of "Jefferson Territory," presided in the trial of the case, which was disposed of at the April, 1860, term of court.

The last meeting of the Denver Town Company's Directors of which their record contains an account, was held on March 11, 1861. After stating the conditions attaching to some lot donations for hospital and school purposes, the record closes with the following entry:

> "Resolved that this Company have never sanctioned the building on any of the Streets or levees of the town and protest against the action of the Council of the People of Denver in permitting Genl L Bowen to occupy that portion of E Street on Which he has placed a foundation. Resolved that a Copy of this Resolution be transmitted to the Council."

1860 was the second year of the first high tide of prosperity for Denver, and in that year its more or less permanent population had rapidly increased. Nevertheless, the town was still a rough aggregation of buildings; some new ones of brick, many of frame, but still a large number of log cabins some of which were used for business purposes. On the outskirts were many tents and wagon camps, the biding places of part of the host which had streamed into the country at the rate of one thousand a day for a while.

Dr. O. M. Clark, of Chicago, who crossed the plains in 1860, and afterward published a little book entitled "A Trip to Pike's Peak," thus records his impressions of the Denver of those days:

"At 10 o'clock on the morning of June 6, 1860, we camped on the highland [Capitol Hill] just above the city, which presented a very neat appearance and was far more extensive than we had conceived it to be. Before us were the abodes of civilization and refinement, while to the right were the smoky wigwams of the aborigines amid which could be seen the dusky forms of stalwart Indians, filthy squaws and naked children, lazily basking in the warm sunlight. Denver City is situated partly in the river bottom and partly on the sides and summit of a sloping bluff which sets back some distance from the river. The city has a population of about 6,000. [?] The bottom below the city is covered here and there with groves of cottonwood and affords good camping ground to the emigrant. At the time we reached there, it was covered with numerous tents and wagons. The business of Denver is large and increasing. Wagon trains are continually arriving, bringing provisions and goods, filling the capacious warehouses and stores."

"The streets are swarming with miners from the mountains, and with arriving emigrants and the din and bustle of trade, the hurry of preparation, the hoarse cry of the auctioneer, furnish a scene of activity that is pleasing to look upon."

In the previous year the men interested in Boulder City had made a great effort to divert a part of the immigration that was pouring up the Platte valley, across to their new town. One of them, the enterprising Henry Clay Norton, constructed a toll-bridge across the South Platte at Fort St. Vrain to make available a fair wagon road that in the meantime had been put in shape from the bridge to Boulder. But this worthy enterprise proved unavailing. The people streamed by the bridge and on to Cherry creek just as if the bridge and road were not mutely inviting them to turn their way; and the crowds which came in 1860 gave them but little more attention and patronage.

W. G. Chamberlain, Pioneer Photographer.

(Many of our illustrations are from photographs made by him.)

The stage company had in the previous summer abandoned its original route into Denver, by way of Cherry creek, past the desolate first cemetery and down the trail that ended in Fifteenth street, and its coaches were coming in by the Julesburg route. The pioneer city of the dead, then far out of town but now within the Capitol Hill district, already had the beginnings of a population, their troubles over, and all permanently situated at last. A considerable portion of those silent dwellers in that growing city of silence, went there through gateways suddenly opened by violence which was death's active assistant in those years. Some of the graves out there marked the end of lives which had left trails of crime and blood and sorrow behind them; and others held what was left of victims of man's iniquity—of those who were stricken down by murderous hands, in the flush of manhood, and with all their hopes and ambitions unfulfilled.

Before April was passed the famous Pony Express had begun its remarkable trips across the continent and was running its ponies into Denver by the branch line from Julesburg. This greatly reduced the time for important communications with the east, and made it seem that the dividing line between pioneer Denver and modern Denver was drawing nearer; a conviction that was strengthened by the appearance of a bright and energetic daily newspaper on the first of May.

On that day Mr. Thomas Gibson, who had, in 1859, been one of the original proprietors of the Rocky Mountain News, but had soon withdrawn from that paper, issued the first number of the daily "Rocky Mountain Herald," a newspaper that had a most useful and influential career.

Among those who put in an appearance here in the spring of 1860 was a man who later gained some notoriety as "Colorado" Jewett, and who came in May. He tried to become a great politician, and posed as a special representative wherever he went, of all that Colorado stood for; and the most remarkable thing associated with him was that so bombastic, shallow and useless a personage could manage to keep himself conspicuous through the many years in which he was widely known by the name he adopted as his special and distinguishing title.

The arrival and departure of the coaches of the Central Overland California & Pike's Peak Express Company, which had succeeded the Leavenworth & Pike's Peak Company, were important events. They came and went with nearly as much regularity as passenger trains now move on the railroads, and large crowds assembled at the company's office to await their arrival or witness their departure. The trips between Denver and the Missouri river were begun every day each way, and the distance by the way of the Pony Express route along the Platte was six hundred and sixty-five miles; the time on this better and somewhat shorter way being now about six days. The passenger fare, exclusive of meals, was reduced to seventy-five dollars. The coaches carried the gold to the east, and at times conveyed as much as forty thousand dollars' worth at a single trip. The bullion was usually forwarded once a week in charge of a special messenger, and upon these occasions every passenger in the coach had to be personally known to the company's Denver officers, or vouched for by some person acceptable to them. This, of course, was a precaution against pre-arranged robbery by coach passengers.

Passengers were not permitted to carry gold-dust in their baggage or concealed on their persons. The stage company demanded special pay for transporting it, and its officers were quick to detect its presence in the clothing of an individual.

Occasionally a passenger succeeded in smuggling some through the journey; there is a story of one who did so, and was forcibly detained at the river by the company until he paid for its transportation.

The arrival of a coach was of greater general interest than its departure. The incoming one brought the mail which was delivered from the company's postal annex to its building on the southeast corner of Sixteenth and Blake streets. It was a large two-story frame structure, and the annex was a long, low, one-story wing extending the distance of half a block. Near by was the office of Hinckley's Express, which, by an arrangement, forwarded mail matter from Denver to the mining camps for about twenty thousand miners working in the streams and gulches.

But the departure of a coach always attracted a motley crowd in which a few Arapahoe Indians were usually conspicuous, standing in silent wonder at all that was going on around them. There was something of pathos in the interest aroused by the movements of the coaches, the only direct connections between the mountains and the distant regions of civilization, traversing the plains back and forth like shuttles in a great loom.

A Denver visitor in the summer of this year thus records his impressions and knowledge of some of the bystanders waiting to see a coach start for the east:

> "That symmetrical dark man of thirty, a swarthy Adonis of the plains, has been a Kansas Border Ruffian, a Nicaraguan filibuster, a prisoner among the Mexicans, wearing a chain and working upon roads for more than a year, a surveyor of the Panama railroad, and a wanderer through the world at large."
>
> "Here is the sanguine owner of a quartz mill in the mountains, which he is persuaded will make him a millionaire. His interlocutor has just sold his quartz mill for half its cost, and is returning to the States declaring the gold region a humbug."
>
> "When I first met that elderly gentleman, he was a wealthy Pennsylvania banker, in broadcloth and fine linen, who had narrowly escaped being made Governor of the Keystone State. When I next saw him he was arrayed in buckskin and corduroys, in a Pike's Peak cabin, cooking flap-jacks for his own breakfast. He is now a candidate for Congress."
>
> "The tall, thin-faced person with mutton-chop whiskers is the famous 'wheel-barrow man,' who trundled his entire outfit across the plains, bringing just ten cents in his pocket. Now he is also an aspirant for Congressional honors."

The great holiday event of 1860 was the celebration of the Fourth of July. Preparations for it had begun several weeks in advance, and the entire population of the city with a good share of that of the Clear creek mining camps enjoyed the festivities. There were artillery salutes and "a grand procession." The crowds finally assembled in the cottonwood grove then on the ground now bounded by the Platte, Fifteenth, Wazee and Sixteenth streets, where local orators voiced the most fervid patriotism and distinguished themselves in the eyes of their fellow-citizens. The pioneer women had made a handsome silk flag which was presented to the city to be kept until Colorado should be admitted to the Union, and then delivered to the Governor of the new State. Nineteen years later Mayor Sopris passed the flag to Governor Pitkin and it is now in the Capitol building with the State's other historic banners.

CHAPTER XXXIV.

Zenith of Placer Mining—Thronged Denver—General Notes—Further Progress of Mining—Building Operations—Agriculture—Women and Children—Pioneer Bankers—Crowded Streets—Stage Coach Mails—Institution of United States Mails—New Theater—Apollo Hall—Second Daily Paper—Pony Express News—Third Daily Paper—New City Government—Outcasts, Saloons and Gambling Houses—Background of the Picture.

While the year 1859 had been a busy one in the "Pike's Peak country," 1860 was still more so. Everything was centered on mining which, in those times, was in a general way surface work that reached its zenith in that year. The mountain diggings were, of course, more certain and more profitable than those of the bars, and the beds of streams; but in 1860 the beginning of the end of these surface stores of the precious metal was visible to the more experienced men, and the unsolved problems of extracting gold from the refractory vein matter were rising like clouds in the not far distant horizon; before the summer closed.

The country was literally swarming with people who crawled over the mountains, through the canons, and up the gulches, nearly everywhere, searching for signs of gold. Denver was crowded. While it contained as permanent dwellers only a small fraction of the people in the country, it was, as it had been from the beginning, the heart of the new gold territory; the financial, commercial and social headquarters of all the populated region around it.

The region was still nominally within the limits of the Territories of Nebraska and Kansas, with their theoretical jurisdictions separated by the fortieth parallel. Denver, now the "consolidated city," was still nominally subject to the jumbled laws of the strife-worn Kansas Territory, but without efficient means of enforcing them. The Arapahoe county organization was the only one having any color of legal authority, but in the face of the divided allegiance of the people, it was limp and inefficient. The futility and impotency of the Provisional Government of "Jefferson Territory"—that political fabric which had inspired so many hopes the year before—were now becoming more and more apparent. But it still retained the good will and support of some of the population, notwithstanding its evident impending dissolution.

The people had to improvise methods for protecting life and property, and for punishing malefactors. This they succeeded in doing most effectively. They were a law unto themselves. When a grave crime had been committed and the offender caught, an informal Court was organized. A substantial citizen served as Judge, with two others as Associate Judges, and a jury chosen from men of character and fearlessness. The prisoner was allowed to have counsel, was immediately tried and if found guilty, sentenced to be hanged within one or two days. There was little delay, and also little probability of making mistakes, in these Courts and in the terribly swift execution of their mandates.

In the hurrying throng of 1860 the previous year's fondness for labelling wagons continued. One arriving outfit drawn by six cows bore the business-like sign: "Family Express; Milk for Sale." "Old Bourbon Whiskey sold Here," appeared on several wagons. Other inscriptions were such as these: "Good-bye, friends; I am bound to try the Peak." "I am off for the Peak; are you?" "The Eleventh Commandment—Mind your own business."

The season had opened most promisingly throughout the whole extent of the Pike's Peak mining region, and Denver was the center of extraordinary bustle and business activity. Mining was continued with redoubled vigor from Boulder county on the north to Lake and Park on the south. The rich placers in the South Park attracted hundreds, thousands, of those who came out that spring and summer, and it was then that the towns there grew like mushrooms in the night. The great Consolidated Ditch in Gilpin county was completed that season, and the result was new working ground and paying places for more than fifteen hundred men, each making an average product of five dollars per day, where before no work was possible. The yields of that district, of parts of Boulder, of the diggings in the South Park, and on the Blue and Arkansas rivers were very large. Fortunes were made in a single season. California Gulch, the present site of Leadville, revealed its astonishing riches, and many an old tin can was filled there with gold dust and nuggets in that spring and summer of 1860. Nearly three millions of dollars were taken from that gulch in that and the next three years. For all this activity Denver was the busy, crowding, surging headquarters.

View of Auraria in autumn of 1860 from near the mouth of Cherry Creek.
(Copy of a somewhat inaccurate picture drawn from a rude sketch in Barber's "Western States and Territories.")

But the Clear creek districts were still the objective points for most of the gold-seekers, and within a radius of twelve or fifteen miles from Gregory's original discovery claims there were probably twenty thousand eager, restless, and toiling men, with now a fair sprinkling of women among them. Some of the miners were making a hundred dollars a day while a great many others—a majority—were taking out lesser sums which ranged all the way downward to bare expenses; and then others on still further to nothing. It is related that one of the unlucky prospectors, a former banker from Kansas, who was also, or had been, a Presbyterian deacon, had turned to making and selling pies on Sundays to eke out the insufficient income of the week-days, and that his bakery business was re-inforced by an improvised saloon attachment.

A large number of quartz mills had been brought out, and by midsummer were in awkward operation, one of them being run by an old Boston merchant. Forty or fifty Mexican arastras, each attended by a couple of men, were producing about twenty-five dollars a day apiece. The placer mining was engaging the attention of most of the men, yet its exhaustion was plainly a matter of but a little more time. But the permanent character of the lode, or "mountain diggings," was recognized, and claims fifty by one hundred feet had changed ownership at prices ranging from ten thousand to forty thousand dollars.

While the work of producing the gold was done at a not great distance, Denver was the place for spending it. The town was the thronged and feverish young metropolis. Buildings were springing up. Some of them were of brick and some of adobe; but the great majority was of frame. A few of these early structures are still standing in the older parts of the city on both sides of Cherry creek. The first brick structure, erected early in the autumn of 1859, was a small magazine building or powder house, for Laflin, Smith & Co., in the rear of their store in the middle of the block on the south side of Blake, street, between Fourteenth and Fifteenth streets. The first brick dwelling was that of Sheriff J. H. Kehler on the site of the Windsor Hotel, built early in 1860; and about the same time Russell, Majors & Waddell built the first brick structure in Auraria—a warehouse that long stood on the west side of Eleventh street, between Larimer and Market streets. By midsummer of 1860 bricks appear to have been by far the cheaper building material, a good quality selling, according to Richardson's statement, as low as six dollars per thousand; a remarkably reasonable price for those times, if that writer were correct in his quotations—which may be doubtful. In sharp contrast was the cost of lumber—usually five dollars per hundred feet that season. Log cabins of twelve months' antiquity were being pulled away to make room for new and larger business blocks in the then central parts of town, and for frame and brick dwellings on the streets near by. Real estate in the business center had advanced in price, and choice corner lots there which eighteen months before would have been presented to anyone who would build a cabin on them, sold for several hundred dollars.

Denver appeared to have taken on the confident air of a permanent town and its future began to look bright and promising. The pioneer daily newspaper, though six hundred miles from the nearest telegraph station, was delivered by carriers at fifty cents per week. Eastern newspapers, of which several hundred arrived weekly, and were usually then ten or twelve days old, sold readily for twenty-five cents. A fore-sighted man had stored a supply of ice the previous winter and now in these warm days of the summer was making his rounds reaping a harvest of profit and blessings from his customers—without any of the obloquy heaped upon his patient and long-suffering successor in our times. The milkman came early and was now doing his daily duty administering to the wants of the people for a consideration equal to twenty-five cents per quart—of milk; and the vegetable vendor was keeping him company, with a plenty of as fine garden products as the soil ever yielded anywhere.

Many of those who had found only disappointment in the mines had turned their attention to the soil, and had learned that Ceres and Pomona could be most generous in their rewards in Colorado. The extraordinary fertility of the land when properly irrigated, had been demonstrated near Golden the previous year. Vegetables, garden fruits, and grain grew amazingly and yielded most bountiful harvests. These planters were supplying the miners and towns-people, and some of them were making as much money as any of their customers. In this summer of 1860 Denver grocery stores were abundantly supplied with home-grown vegetables—potatoes, pumpkins, beets, turnips, cabbages, cucumbers, and so forth. There were cabbages weighing twenty-three pounds, beets of thirteen pounds, and a turnip weighing fourteen pounds, exhibited.

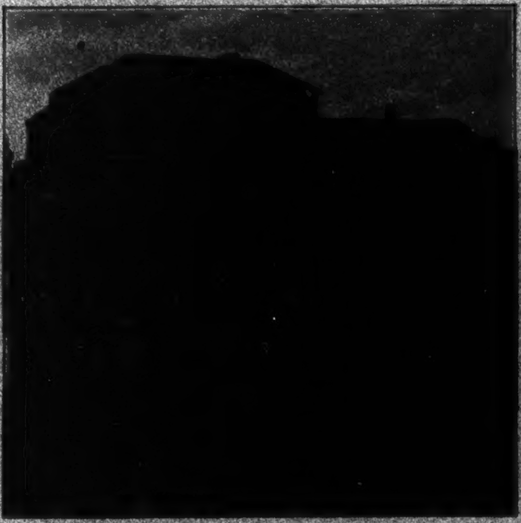
Women, who had been so few and far between a little more than a year previous and who had been gazed at curiously by the primitive citizens, were no longer subject to such distinguishing attentions; and children, who were not much in evidence a twelve-month before, were now important and fairly numerous members of the community. Women and juvenile pioneers had arrived in considerable numbers with the later throngs, and they were hostages to better order and conditions, and to the demands of civilization, in the reckless frontier city. Their presence meant the establishment of homes; and that further meant an end to the roughness of a mining camp infested by scoundrels of all degrees. The two could not exist side by side, as the Vigilance Committees were demonstrating to the conviction, if not the satisfaction, of the element which had to give way.

The miners and other people who had gold-dust but no safe places to deposit it, carried it on their persons in belts and buckskin bags, and paid their bills in bullion delivered on the spot. The C. O., C. & P. P. Stage and Express Company transported most of the gold sent east, and in doing so had drifted into a little semi-banking business in the way of accommodation. But before the middle of June, the brothers George W. and Samuel Brown, opened a bank, the first one in the new country, and its senior founder became and long remained one of the honored of Denver's citizens. Late in that month Turner & Hobbs opened the second banking establishment; then Clark, Gruber & Co., built their banking house and mint at the corner of Sixteenth and Market streets, and on July 20th opened their noted establishment in it. The building was later purchased by the United States, enlarged for the purposes of a Mint and assay office, though no coining was done by the government. With the addition of these banking facilities the business affairs of the community were immeasurably convenienced; though there are traditions that interest rates ranged, upon occasion, all the way from ten to twenty-five per cent. a month. The historical details of these and other early financial and banking undertakings will be presented in what is deemed a more appropriate place in this volume.

By midsummer of 1860 Denver including the town of Highland embraced about three thousand acres of building lots all nicely staked off, and represented by plats and drawings which were works of art on the part of the real estate men of those days. The regular town population numbered upward of four thousand—or, according to the uncertain census taken in the autumn of that year, four thousand, seven hundred and forty-nine—but there were hundreds of transient people, and others from the outlying mining districts, thronging the business streets. Blake, McGaa and Larimer were as crowded with people of all kinds and conditions, as our Sixteenth now is with buyers in the holiday shopping times. There were merchants, miners, traders, teamsters, stage drivers, speculators, gamblers, swindlers, on down to the dregs of a frontier population. Women, good, brave mothers and daughters of established households, brightened the motley concourse; and many others, far from good, exhibited themselves in the public places. The sanguine newspapers left few events of consequence unrecorded, and the town in every way was a reckless, feverish, conspicuous example of the American frontier "city," of conditions and circumstances that will never be again.

As in the previous year, the dominating stage and express company was still carrying mail matter into and out of Denver, and conducting a lucrative postal business of its own at a charge of twenty-five cents a letter, with proportionate rates for other matter. When the Leavenworth & Pike's Peak Express Company began operations, the Postmaster at Leavenworth was directed from Washington to deliver all mail matter for the Pike's Peak region to the company so long as the coaches would carry it across the plains free of expense to the government. This gave that Express Company and its successor organization a monopoly in handling the mail, and which continued until past midsummer of 1860.

Upon the arrival of the mail coaches nearly every man in town expected, or pretended to expect, some letters, and the only way to serve them impartially was to require them to form in lines, and thus approach the delivery windows, at the Express Company's office in turn. This resulted in the spectacle, a common one in 1860, shown in the adjacent illustration. By that time the Leavenworth and Pike's Express Company had been succeeded by the Central Overland, California and Pike's Peak Express Company under practically the same ownership, and which had built a large frame building on the southeast corner of Sixteenth and Blake streets, to accommodate its business. The mail delivery was in charge of a young man who is now known so well by our people as Judge Amos Steck. His proficiency in his work and his familiarity with names and faces were so thorough that he could recognize individuals far down the line, and by calling out that no mail awaited them relieve them of the slow and tiresome task of tediously hitching along to the delivery windows. Much time was consumed in delivering the mail. The recipients had to pay the carriage charge of twenty-five cents for each letter, and in most instances that small value in dust would have to be carefully weighed out.



At the Stage Company's Post Office, 1860.

Many men in the mountains experienced great difficulty in hearing from home, a hardship that appears to have been chiefly due to their failure to instruct their friends how to address them. A large portion of the letters coming to the region was addressed simply "Pike's Peak" without the name of any town or camp. All of these came direct to Denver, and if the persons addressed were not here, the letters were sent on to the mining camps. The express companies were at great care and trouble to make delivery, and persistent in their efforts to locate men for whom they had letters, but their endeavors were often defeated by the migratory habits of many of the miners. Another circumstance that prevented numerous letters reaching the persons for whom they were intended, was the adoption of the same name by several individuals. It was not a rare thing for a man upon arrival in the new country to discard his old name and take on a new one, for reasons well-known to himself. Such changes were usually to some common, simple one, and therefore "John Smith," "Tom Jones," and the like, applied to quite a number of gentlemen.

Some of the miners remotely located made great sacrifices of time and toil to get an occasional bit of mail from the nearest express office, though the nearest might be distant more than a day's hard tramping. An incident which fairly illustrates this, is related of one Noah Davis who was mining in Park county in 1860. He had received no tidings from his wife for a long time, and one day he was told by a friend from Gregory Gulch that four letters were waiting for him at the office in Mountain City. There was no way to get them except to walk over the mountains to that place, and poor Smith accordingly tramped the entire distance of ninety-four miles only to find that some other man of the same name had taken the letters from the office.

It was not until the summer of 1860 that the transmission of United States mails to and from Denver was regularly and permanently inaugurated; although for a few weeks in 1859 some had been transmitted to and from the settlements, and a Post Office had existed. The C. O., C. & P. P. Stage and Express Company had realized early in 1860 that the people would not much longer tolerate the old and costly methods, and therefore procured a contract for carrying the mails. The influence of its owners secured the appointment of W. P. McClure to be Postmaster at Denver, in July of that year, and he, by direction of the Stage Company, established his office in a building on the southeast corner of Fourteenth and Larimer streets. On Friday, August 10th, the re-established post office received its first mails under the new arrangements, and under the regular postage rates. Its business was relatively a very large one from the start, and has ever since been one of unusual volume in proportion to the number of people it serves. In connection with our accounts of the various stage and express companies of the pioneer era, we will present some further details of postal operations on the plains and at Denver, including those pertaining to the first United States Post Office at Cherry creek, established in Auraria City in the summer of 1859, and that had a very brief career.

In August of 1860 an important theatrical improvement was undertaken by E. W. McNeal, Henry Murphy, Frank Amsden, Alvin McCune and Henry Hitchins. They then began the erection of the Platte Valley Theater on the northeast corner of Sixteenth and Lawrence streets, which, for its time, was a pretentious place of amusement. It was completed that autumn and opened early in December by a company brought here by George Harrison of Central City, a somewhat notorious pioneer theatrical manager. In 1861 the house was bought by Jack Langrishe who made many improvements in it, and gave it the name "Denver Theater." Its opening under his management, on November 30th, was a conspicuous social event of that period. As a theater it was conducted by Langrishe on a far higher plane than any other place of amusement in the town; and it was also utilized in subsequent years as a place for holding public meetings. The most important of the railroad meetings later in that decade, in which construction of the first railway to Denver was discussed and planned, was held there; and at other times many distinguished men addressed the people of Denver from its stage. The building lives in local history as "the old Denver Theater." Two of its original builders, McNeal and Hitchins, are now living in Helena, Montana; the others are dead.

The pioneer Apollo Hall drinking and gambling establishment, with its theatrical department on the second floor was, in the summer of 1860, as it had been for nearly a year, one of the boisterous centers of attraction in the town. In the autumn of that year the theater had passed into the hands of Jack Langrishe who toned it down, somewhat. But before his time the audience room was neither ceiled nor plastered, and the little illumination it possessed came from a dozen or so of candles stuck around on the undecorated walls. It contained rude benches which would afford crowded seats for three hundred persons, the price of admission was one dollar, and the "standing room only" sign was usually needed, even if it were not hung up at the entrance. Not infrequently some of the most pathetic passages and scenes on the stage were provokingly interrupted by the clinking of glasses, rattling of billiard balls, and boozy attempts at vocal melodies from the uproarious regions below.

On August 27th the pioneer of the Denver newspapers, the Rocky Mountain News, which had theretofore been published weekly, began issuing a daily edition which has continued without interruption from that day to this. Early in November it began publishing telegraphic news, the first newspaper service of that kind received in Denver. These dispatches did not come all the way through by wires, for there were then no wires anywhere near Denver, but came from the Missouri river by the Pony Express. The first dispatch, with news of Lincoln's election, left St. Joseph on the afternoon of November 8th and was published in the edition of the News of the 13th of that month. This service was continued in 1861 from the advancing end of the overland telegraph until the wires themselves made connection between Denver and the outside world. The Pony service made the news somewhat late according to our present notions, but the enterprise was a notable one for that time.

Face of envelope containing message with news of Lincoln's election. (Reduced one-half.)

Though Denver had two daily papers, the third one now made its appearance. So far as national politics were concerned the first two were advocates for the young Republican party, but politics had not figured a great deal in local affairs. On August 25th Coleman & Moore began publishing the daily and weekly "Mountaineer," the first Democratic paper in the Rocky Mountains country.

Of these by-gone times in Denver, Richardson, whose book preserved many reminiscences of events that came within his own knowledge, remarks:

> "It was a fascinating country for a journalist. Over his devoted head daily and nightly hung the sword of Damocles. An indignant aspirant for Congress, meeting the editor of the Denver Herald in the street, spat in his face. Mr. Byers, of the News, whose establishment after the first murderous assault was a well stocked armory, * * * by taking a bold stand, verified the proverb that threatened men live long."

So great had been the influx of people this year that by the end of this last summer month the mining region around Denver was estimated to have contained upward of fifty thousand men. But, while hundreds had been coming, other hundreds had been going. So, the aggregate of those here did not begin to represent the immigration of that year, nor was more than a small proportion of it in the country with intentions of permanency.

The city government organized under the "Jefferson Territoty" "charter" had become weak and inefficient before the year 1860 was half gone, although it had entered upon its career with a spirit and briskness that promised well. Toward autumn of that year the government had become practically impotent. "Mayor" Moore, who was a southerner and a sympathizer with the intentions of that section if the Presidential election went against it, was giving little attention to the office to which he had been elected under the "Jefferson" "charter." The rest of that city government had practically disintegrated, and so the city was going alone.

In consequence of this condition of affairs a public meeting of citizens was held early in September at Apollo Hall to provide some form of city government that would effectively hold together until the organization of a Territorial government, anyway; for in that autumn it had been determined to again appeal to Congress at the session of 1860-61 to establish a separate government for this region, the impotency of the "Jefferson" arrangement having become generally recognized and conceded. The meeting decided to organize "The People's Government of the City of Denver," and appointed a committee to draft a form of local government under that name and title. Another meeting was later held at which the report of the committee was received and adopted, and it was also decided to hold an election on the first Monday in October to ratify the new "city constitution" and to elect officers under it. The "constitution" was ratified and officers elected; and the new organization gave the city a far more effective and useful government than had hitherto been enjoyed, although it was lax in some respects. Additional particulars of this movement will be found in connection with the history of our city government elsewhere in this volume.

It was thought in the spring of 1860 that building operations had attained as high a pressure as there was any likelihood they would reach during the year, but as the season advanced they were pushed forward with still greater vigor. During the summer months buildings of every variety and for almost every purpose were erected in large numbers, and at a rate of speed that was limited only by the supply of material to be had. The saw-mills and brick-yards could not meet the demands made upon them. On some structures work continued day and night until they were completed. In many instances both store buildings and dwellings were occupied before they were more than two-thirds finished. Carpenters, bricklayers and other house-building mechanics commanded fabulous wages, and were autocrats of the situation. Five, six, and eight dollars a day, and even higher prices in emergencies, were paid men who could build houses and do it without the unnecessary delay of an hour.

In the midst of all this ceaseless activity, honest toil, and worthy endeavor, were scores of human leeches and parasites; robbers, gamblers, desperadoes, petty thieves, and poor wrecks of womanhood. Like buzzards which detect their unsavory food from afar, these outcasts had come in flocks in the spring months of 1860, after the fashion of migratory birds that move by night, following the vernal influences and presenting themselves to-day where they were not to be seen yesterday. Such people had come in comparatively great plenty the year before, but this year they came as an invasion. The deeds of some of the worst of these were of such a character that they afford, together with the remedies applied, proper subjects for a chapter by themselves.

House occupied by Richardson in 1860—near intersection of Nineteenth and Stout streets.

If enterprise and industry were always well-directed, the founders and keepers of the 1860 crop of saloons and gambling houses should receive a share of praise. In establishing themselves and in maintaining their resorts, which graded from the fairly kept to the unspeakably vile, they did work enough to have yielded them a livelihood in any worthy occupation. Proportionately, there were more of these wretched blemishes in Denver in 1860-61 than in any other period in the city's history. In some localities they shouldered each other in rows, and from one week to another, through the months, night and day, their doors were never closed.

It is related that in these good old times, when two friends approached a bar, and one asked the other—not if he would drink, for that would have been superfluous west of the Missouri river in those days, but what he would drink—a dozen or so of the ever-present loungers would immediately step briskly forward with the remark that they would take sugar in theirs. Usually, this was all right, for frontier hospitality was laid down on broad lines, especially for ceremonies and refreshments of the bottle.

From all these thronged highways and places of confusion, exultation, and despair, where success and failure jostle one another, where viciousness glares at virtue and menaces it, and in which we see man's eagerness for gain leading him along avenues varying in character from the straight and narrow path where honor and integrity walk together, to the devious ways trailing downward to the depths of vice and iniquity, the author of "Beyond the Mississippi" invites us to turn away, and with him consider the noble picture that forms the back-ground of these shifting scenes. As he saw it in 1860, it is now, and ever will be, until the end of the world:

"But look up, beyond the city, the tufts of trees and the green prairie! Eighty miles to the south, Pike's Peak, like an old castle, 'majestic, though in ruin,' lies dim and dreamy against the sky. Seventy miles to the north stands Long's Peak distinct, rugged and corrugated, its feet wreathed in pine, and its head crested with snow. A dark, irregular, variegated wall, at the verge of the sensible horizon, sweeps grandly between; and beyond, on either end, merges into the debatable ground between earth and sky."

"It reveals every hue, from the dark, rich purple of the nearest hills, to the unsullied white of the Snowy Range; every form, from the long, flat summit of Table Mountain, to that perfect cone, waiting to impale the dying sun. Gaze on it daily for months and you shall never find the same picture, but always an endless variety, a perpetual delight."

"Here at the door of our rude cabin, Nature spreads before us such a panorama as never feasted the eye of monarch in his palace. Last night that furthest mountain was arrayed in a fiery glory too dazzling to look upon. Now it is robed in the pale, unearthly light of another world. Does it seem that you could ever reach it by mortal means, or clothed in mortal body? You can only think of the Celestial City, as it burst upon the vision of the pilgrim Christian; or those Sabbath evening pictures of heaven opening to earth, received in childhood at your mother's knee."

"The sun goes down, but the cold air assails you in vain. Still you lie upon the sward in silence, that 'perfected herald of joy,' until the last fold of night's curtain has fallen and shut out the miracle. How the glories of painter and poet, earthly ambitions, human life itself dwarf before it! In wonder, humility and thankfulness you remember the work of the Great Artist."

CHAPTER XXXV.

REIGN OF THE LAWLESS—OUTRAGES BY RUFFIANS—METHODS OF THE PEOPLE'S COURTS—HOMICIDES IN 1859—WAR AGAINST "CLAIM JUMPERS"—THE "TURKEY WAR"—SERIES OF WANTON HOMICIDES IN 1860—REMARKABLE CASE OF JAMES A. GORDON—ATTACK ON THE OFFICE OF THE ROCKY MOUNTAIN NEWS—GREAT ORGANIZATION OF HORSE THIEVES—GRIM FATE OF ITS DENVER LEADERS—OTHER TRAGEDIES—DEATH OF HARRISON AND McCLURE—EFFECT OF EXECUTIONS BY PEOPLE'S COURTS—NOT THE WORK OF MOBS.

In the reminiscences of Denver's pioneers none of the narratives surpass in thrilling interest those which recount the tragic events associated with the brief reign of the lawless in 1860, and tell of the grim but merited retribution that ended the conflict between defiant criminals and determined men who demonstrated their power to protect their lives and property. It was not until that year that Denver was literally overrun by ruffians, thieves and gamblers, and every man's life and property put in peril. From the autumn of 1858 to April, 1859, there was no bloodshed and little or no thieving. Through 1859 three homicides had occurred, and one duel had been fought. Aside from the fatal duel of March, 1860, that year's homicides in and near Denver, then a comparatively small town, aggregated nearly a dozen, most of them cruel, wanton murders; and with these death-dealing acts of violence, robbery of persons, and all manner of thieving were of almost constant occurrence.

As the spring of 1860 passed into the summer outrages by desperadoes in some defiant form became daily happenings. Frequently one of these scoundrels, inflamed by the vile liquor retailed over most of the numerous bars, would draw his revolver upon some peaceable bystander, compel him to drop on his knees, submit to every vile epithet, and beg piteously for his life. The ruffians who committed such acts seemed for the time to be insane from the liquor in them. It was noticeable, however, that these wretches were never drunk enough to attempt their outrages on men known to be dangerous. These and kindred conditions came to such a pass that the citizens, while about their daily business, had to go heavily armed to protect themselves from wanton assaults by such ruffians.

The mining camps were not so seriously beset by these murderous villains. It was about two years after the Gregory and Jackson discoveries until the regularly organized and constituted Territorial government of Colorado was established and in working order, yet during that interval only two murderous homicides are recorded as having occurred in the mining camps in the Denver region, and there were not many criminal cases of any grade brought before the Miners' Courts. One reason for this was the dread of the certain and instant retaliation that would follow outrages there, and which suddenly did follow them here; and another was that the desperadoes, influenced by their gregarious instincts, took more naturally to the town where there was at the time less unity of purpose among the people and more individual absorption in personal affairs. Furthermore, there was the feeling of security and the disposition to be aggressive that the presence of numbers usually inspires among such men; and the familiar character of the haunts and dens open to them, with the congenial atmosphere and surroundings they afforded, combined to make the town more attractive, and the preferable place for the kind of lives they chose to lead.

The chaotic political condition had contributed not a little toward making the lawless element more reckless. A large portion of the citizens claimed that the jurisdiction of Kansas Territory had been displaced by that of the "Territory of Jefferson" which, they maintained, was the government of the region. The minority portion contended, and with technical correctness, that "Jefferson" was legally a myth, devoid of authority and devoid of power to do anything. Naturally, the vicious element in the population accepted each statement as offsetting the other, and therefore assumed that there was no government by law, at all. The "laws" of the Provisional Government of "Jefferson" had been published, but much of the novelty of the new "government" had worn off by the spring of 1860, and it was unable to find ways and means of effectively enforcing its "laws" for the preservation of public order.

For other causes the Kansas jurisdiction was almost as inefficient, and it was at times discredited by some of its own partisans.

But defiant crime culminated, as it always does, and brought the heavy hand of retribution upon itself from Vigilance Committees, which administered the only adequate remedies for conditions that had become intolerable. Aside from these there were troubles enough that were incident to the isolated situation and to the neglect of the National government; and therefore the people turned to the only effective available means of dealing with the miserable devils who were wantonly tormenting them.

There is some impropriety in terming these People's Courts "Vigilance Committees," because the latter conveys some implication of hasty, inconsiderate action by mob. There was none of that in the conduct of these impromptu tribunals. They deliberately but relentlessly did the work called for by the emergencies, and there is no record that they ever made a mistake and sent out of the world an innocent, undeserving man. The evils with which they had to deal justified their methods and their applied remedies.

North side of Larimer street between Fourteenth and Fifteenth sts. in early Sixties. Second building is the old "Apollo Hall."

The deeds of the lawless element and the vigorous retaliation dealt out to such enemies of the community, were thought by some observers to have left an impress on the people that manifested itself in a recklessness of life. It were not strange if such a heritage lingered through some of the succeeding years. However that may have been—if these tragedies did exert a hardening influence that somewhat blunted sensibilities—it did not survive in the substantial element of the community.

While the reign of the lawless did not begin until 1860, there had been, as we have stated, three homicides in and near Denver in 1859. The circumstances of one of them have been related, and we will include here some further account of the other two before passing to consideration of the evil deeds which followed in the succeeding year.

On April 7, 1859, the first murder in or near the new settlements, occurred. An old German named Biencroff, with his two sons, and his son-in-law named John Stoefel, who was a Hungarian, were in camp on Clear creek near its mouth. On the date above stated all of them set out to look for their cattle, and when they returned to camp, Thomas Biencroff, one of the sons, was missing. The next morning Stoefel came into Denver, and the elder Biencroff and his surviving son started to search for the missing man. His body was found with a bullet-hole through the head. In the meantime Stoefel had reached town and disposed of a little sack of gold-dust to R. L. Wooton at his store in Auraria. This dust he afterward confessed he had taken from the body of the dead man. The elder Biencroff and his son, after they had found the body of their murdered relative, followed Stoefel into Denver and caused his apprehension. Stoefel at once confessed the crime, and stated that he had followed his victim from the east for the purpose of killing him. The citizens decided to give the man the form, at least, of a trial. A People's Court was organized with S. W. Wagoner presiding. Twelve men were called as jurors, and a pioneer lawyer was appointed to see that the man was fairly tried.

Stoefel's confession left little for his attorney to do. The jury speedily returned a verdict of guilty and Stoefel was sentenced to be hanged the next day at two o'clock in the afternoon; and hanged he was at the appointed time from the limb of a cottonwood tree that stood near the intersection of Tenth and Wazee streets; a frontiersman nicknamed "Noisy Tom" acting as executioner.

Of this first execution here, Wooton, who was a participant in the trial and a spectator of the final proceedings, says in his recollections of these times:

> "Three men got into a two-horse wagon and were driven under a cottonwood tree on the bank of Cherry Creek. These three men were the prisoner, the executioner, and a minister who had found his way out from the east along with the great crowd of gold-seekers. A rope was placed around the murderer's neck and thrown over a limb of the tree. Then the minister, a good Christian man, kneeled down in the wagon to offer up a prayer, and the executioner also got down on his knees. The fellow who was to be hanged didn't follow their example, but stood up, until the executioner poked him in the ribs, and asked him if he didn't know better than to act like a heathen. After prayer the wagon was driven out from under the tree, and the man who had murdered his friend, to get possession of a few dollars' worth of gold-dust, was left dangling from the cottonwood limb until he was pronounced dead, and cut down."

The difference between newspaper practices in those days and at the present time is indicated by the brief but concise account given of this affair in the first issue—April 23rd—of the Rocky Mountain News. Instead of columns of details the following few lines were deemed sufficient:

"On the 7th instant four Germans, an old man, two sons and a son-in-law, set out from their camp on Vasquez's fork to look for cattle. But one, the son-in-law, returned. After returning he acted so strangely as to arouse suspicion that all was not right, and he was arrested, when he confessed that he had murdered his brother-in-law. A search was instituted and the body of the murdered man found, shot through the head. The murderer was put upon his trial before Judge Wagoner, found guilty on his own confession and forthwith executed by hanging to a tree."

After the two April homicides there were no more fatal affrays in the Cherry creek towns until the following autumn. On October 20th W. J. Paine shot and killed Oliver Davis. Both were colored men, citizens of Denver City, between whom bad feelings had existed for several weeks. In the fatal encounter Davis was the aggressor, but Paine, who afterward made no attempt to escape, was too quick for him. Paine was tried and honorably acquitted, his act having been clearly proved to have been one of self-defense. This affair occasioned but little excitement in the communities, and through the remainder of that year there were no other happenings out of the usual course of events. It was not until the close of the following January that a season of turmoil was inaugurated in the two towns—the "war against the claim-jumpers" in Denver City, and the "turkey war" in Auraria."

On January 30, 1860, a party of men of which William H. Parkinson and two of his close friends named Thompson and Mickie were the leaders, "jumped" some Denver town lots beyond the northeastern outskirts of the built-up part of town. "Jumping," as we have heretofore stated, was, in the parlance of those days, a more or less successful attempt of one party to take possession of and hold a plat of ground previously claimed by another. At this time but few improvements had been made in the part of Denver where Parkinson and his associates began operations, and they at once prepared to build on the lots, which were claimed as the property of the Denver Town Company, which had, as the reader has seen, acquired title by much the same method. But for all that, lot-jumping could not be tolerated in Denver when these attempts were made, for no man's title to ground would then be any better than he could make it by standing guard with a loaded rifle in his hands.

Therefore, a public meeting of Denver's citizens was held in the forenoon of January 31st, with "Mayor" John C. Moore as President, and Samuel S. Curtis, Secretary, to take action and to provide further protection against this new danger. Lot-owners had previously organized what they called the "Arapahoe County Claim Club" for mutual assistance in repelling claim-jumpers, and had adopted rules and regulations to that end. It cannot be said that the "claim club" was always in the right, but its general purposes were well-meant. The citizens' meeting adopted firm but conciliatory resolutions against "claim-jumping," the men present pledged themselves to sustain and abide by the rules and regulations of the "claim club," and to assist each other in the maintenance of their rights. The meeting then adjourned and about eighty of its members went out to warn the "jumpers" to discontinue their work.

But it was one thing to warn them and another to make them quit. When the delegation came within a hundred yards of the scene of operations it was called to halt by four men who had been working on a building, but now stood with rifles at their shoulders. The delegation consulted and then sent "Mayor" John C. Moore forward with a flag of truce. On his return he reported that the jumpers had about forty loaded rifles in their arsenal and that they proposed to fight. The deputation again had a consultation, and while some of its members insisted on immediately charging the enemy, a majority opposed a battle, and the party withdrew, leaving the "jumpers" in possession. When the deputation got back into town another meeting was held, in which vigorous speeches were made, but no definite line of action agreed upon.

Thus matters stood throughout the following day the excitement steadily increasing. On the night of the 31st some parties went to the "jumpers'" first and nearly finished building, tore it down and chopped up the material. The next morning, after the "jumpers" discovered the destruction of their building, they armed themselves and set forth to hunt down R. E. Whitsitt, the manager of the Denver Town Company, whom they accused of the destructive act. Whitsitt, unconscious of danger, was met on the street by one of the "jumpers" who levelled a rifle at him, but was prevented by one of Whitsitt's friends, from shooting. Other armed men continued on the streets all that day searching for Whitsitt, but without finding him.

The citizens met again in the afternoon of February 1st, but no definite course of action was agreed upon, though many more speeches were made. After its adjournment Major R. B. Bradford who had taken part in it, was met by William H. Parkinson, who was heavily armed and in company with a half-dozen friends who were interested in the "jumping" and likewise equipped. Parkinson accused Bradford of having made false statements in the meeting, which the latter denied and proceeded to sustain his denial by testimony from some bystanders. Parkinson refused to hear them and, drawing a revolver, fired three shots at Bradford. Though but a few feet distant Bradford was not hit. This affair came near precipitating a pitched battle and would have done so had it not been for a few cool-headed men in the community.

On Friday afternoon at 2 o'clock—February 2nd, a meeting of the citizens of Denver was held at Apollo Hall to take decisive action. It was largely attended and an unmistakable determination was manifested to instantly suppress "lot-jumping." A few brief but incisive resolutions were adopted, but before the meeting finished its work, E. W. Wynkoop, on behalf of the "jumpers," submitted a written proposition from them for peace. They proposed that if the Denver Town Company would reimburse them for their expenses and losses they would vacate the land on which they had entered, and abandon their purpose. At a meeting held in the evening of that day the proposition was accepted. This ended active operations in the "war against the claim-jumpers," but the affair left many bitter personal feelings which did not entirely disappear until several years afterward. In none of the emergencies he had to meet did Whitsitt exhibit more of his absolutely fearless and determined character than in this one.

West side of Eleventh street between Market and Larimer in the early Sixties

Auraria's contemporary turmoil grew out of quite different circumstances. The year 1859 had brought into the country a horde of thieves whose operations ranged all the way from robbing clothes-lines to stealing a saw-mill. Of the last-named enterprise Wooton relates the following:

> "It is an actual fact that one of the first steam saw-mills set up near Denver, was stolen, not by the man who put it up, but before he got possession of it, from St. Joseph, Missouri! It had been shipped to that point from St. Louis, and while aboard the boat on which it had been forwarded to St. Joseph, waiting for the owner to come and claim it, it was unloaded one night to a flat-boat, and pushed some distance up a small stream running into the river. Then it was taken off the flat-boat, loaded on to wagons, and brought through to Colorado. The man who bought it to go into the milling business in Denver, a year or two after it was first brought to the country, hired a man to set it up for him, who identified the stolen property, and it had to be paid for the second time."

The two towns had been infested for several months by a particularly pestilent gang of thieves self-named and styled the "Bummers;" and membership in it was openly and boastfully proclaimed. Many depredations had been committed during the early months of that winter which were attributed to the "Bummers." In the afternoon of January 30th a ranchman who had brought a wagon-load of turkeys to Auraria was robbed of most of his fowls by the "Bummers."

The citizens of that town, determined to end such proceedings, held a meeting and appointed a committee to investigate the affair. The committee promptly did so and reported that "Bummers" Thomas Clemo, William Todd—alias "Chuck-a-luck," and William Karl—alias "Buckskin Bill," were the active agents in the theft. When this became known the excitement increased, for the despoiled ranchman had vociferously denounced the community that permitted such outrages to be perpetrated.

The "Bummers" prepared for war, marshalled all their forces, and carrying guns and revolvers in their hands, paraded the streets, defying the people of Auraria to molest them. During the night peaceable citizens were halted by these armed scoundrels and ordered off the streets, and it began to appear that the "Bummers" had possession of the town. About nine o'clock in the evening, W. H. Middaugh, who had been active in that day's movement against the thieves, while standing outside the door of the Vasquez House on Eleventh (Ferry) street, was fired at by one McCarty, a "Bummer." The bullet missed Middaugh and passed through the door into the hotel. Middaugh went inside, and in a few minutes another "Bummer," named George Harvey, came to one of the windows through which he took a shot at Middaugh. This one also missed its target.

A military company, the "Jefferson Rangers," had been organized in Auraria two weeks before, and news of the night's condition of affairs was sent to its drill room where, fortunately, the messenger found its members assembled for drill. The "Rangers" at once marched forth to the scene of disturbance. The "Bummers" had left, with threats that they intended to burn the town that night. Therefore, the "Rangers" went on patrol duty which they continued until morning. Just before the patrol had been posted, Thomas Pollock, one of the bravest of men, had encountered McCarty who had shot at Middaugh. McCarty threatened Pollock with a huge bowie knife, whereupon Pollock cracked the "Bummer's" skull with a blow from a rifle barrel. Just after this happened Harvey came up and drew a revolver on Pollock, but the clicking of several revolvers in the hands of the citizens who had in the meantime joined Pollock made Harvey run away into the darkness.

No further disturbance occurred during that night, the vigilance of the rangers overawing the "Bummers." The next day, in the forenoon, another meeting of the Auraria citizens was held at which a resolution was adopted declaring that "Todd, Harvey, Clemo and Karl must leave the city within five hours, under penalty of being hanged if found within the city limits at the expiration of that time, or ever afterwards." On the morning following this order, George Steele, a Denver City desperado, who six months later figured in a tragedy on the east side of the creek, and who had been warned to keep out of Auraria, appeared in that town, using violent and threatening language against certain citizens who had led the movement against the thieves. The "Rangers," learning of his presence, started out to dispose of him; and he, learning of this movement, fled back to Denver City. Todd, Harvey and Clemo had promptly obeyed the citizens' mandate and left Auraria; but Karl lingered. On Friday night, February 2nd, he was found by a committee, secreted in an Indian lodge. He begged for his life and promised to leave at once if it were spared. He was given five hours more time; and he left and was never seen here again. Vigilant guard was maintained by the "Rangers" in Auraria for several nights longer, but the "turkey war" was ended by the smashing of McCarty's head and the banishment of the other leaders of the "Bummers." Several months afterward two or three of the leaders sneaked back but, as they behaved conservatively, they were not hanged.

This vigorous action broke up the thieves' organization and brought an end for a time to the more flagrant depredations from which both towns had suffered. While it did not stop all pilfering, the operations of the thieves were not again of the defiant, daring character they had assumed, though they again became very exasperating early in the following summer.

After the "war with the claim-jumpers" in Denver City, and the "turkey war" in Auraria, there was another brief season of comparative peace in the two communities. It endured for about six weeks, when the first of the many homicides that blackened the history of 1860, occurred.

On the afternoon of March 13th Moses Young deliberately shot and killed William West, using a shot-gun loaded with fifteen buck-shot, all of which entered West's body from a distance of less than twenty feet, and caused his death in about fifteen minutes. Both men were from Leavenworth, Kansas, and were old acquaintances, if not friends. The shooting occurred in front of West's cabin which stood on the west bank of Cherry creek between Larimer and Market streets. Young immediately attempted to escape. He eluded his pursuers until evening when he was captured. The next day he was tried by a People's Court which met in "Denver Hall," and which was officered by a presiding Judge and two associates, the Sheriff, a Secretary, and a jury of twelve men. The names of none of these men are of record except that of Sheriff Kehler. Young was given a fair trial, but the evidence was overwhelmingly against him, and he was sentenced to be hanged the next morning, March 15th. A scaffold was put up on the spot where he had killed West; and there he was hanged at the appointed time. On the scaffold Young admitted the fairness of his trial and the justness of the swift retribution that came upon him. In his last hours and moments he was given by "Father" Kehler such comfort as he was capable of receiving.

On Friday, March 30th, John Rooker shot Jack O'Neil, in Auraria, the wounded man dying in a few minutes. Both were well-known pioneer citizens of that town. Rooker disappeared over night but turned up the next day and demanded trial. The Rocky Mountain News says he was given "the form of a trial" and discharged, but does not state where or by whom. It appeared that a difficulty had arisen between the two men a week or so before, which O'Neil proposed to settle with bowie knives in a dark room. Upon Rooker declining, O'Neil denounced him as a coward. O'Neil was then charged with having said evil things about Rooker's relatives, which led to the encounter. This affair caused no little excitement in the community.

On April 20th a Sioux squaw whom the white people called "Pocahontas" came into town, sold some pelts and got drunk on the proceeds. In the "Mountain Boys'" saloon in a scuffle with its French keeper named Labine, she shot and mortally wounded him, his death ensuing the next day. "Pocahontas" disappeared and nothing further was known of her.

On June 12th Marcus Gredler killed Jacob Roeder southwest of Denver near the mouth of Bear Creek canon. They were from Leavenworth, and in the morning of that day had passed through Denver on their way to the South Park. A dispute arose between them during the afternoon, and in camp that night Gredler killed Roeder with an axe, cutting off his head. The murderer was captured and brought to Denver the next day and immediately tried by a People's Court which met in "Apollo Hall" and was presided over by William M. Slaughter, with John W. Kerr and Charles P. Marion sitting as associates. There was nothing in Gredler's favor on which he could make defense, and he was found guilty and sentenced to be hanged on the following day—June 15th. A scaffold was put up on the east bank of Cherry creek at the Curtis street crossing, and there, in the presence of between three thousand and four thousand people, Gredler paid the penalty.

On June 20th William T. Hadley, a wagon boss, killed one of his employees named J. B. Card, with a butcher knife. The murder, which was a brutal and atrocious one, occurred where the present stock yards are located, and was a consequence of a trifling altercation between the two men. Hadley was brought into town and tried on the 24th by a People's Court, presided over by William Person, with A. B. Babcock and George Wynkoop as associates. The trial attracted a great crowd, and was held outdoors below Wazee street between Fifteenth and Sixteenth. The case was prosecuted by H. R. Hunt and John H. Sherman, while the prisoner was defended by Judge G. W. Purkins, the jury consisting of the regular number of men. The proceedings were short, sharp and conclusive. The jury found him guilty, and the Judge asked the prisoner if he had any reasons to offer why sentence of death should not be passed upon him. To this Hadley replied: "I have nothing to say." Then the Judge addressed the four hundred or five hundred spectators, saying: "Gentlemen, you who believe this verdict is just will say 'Aye.'" There was an overwhelming roar of affirmatives. "Contrary minded will say 'No.'" One voice responded with the solitary negative in the great crowd. With immovable serenity the prisoner heard the question of his life or death submitted to the assemblage, like a point of order or a resolution, and with calmness received the all but unanimous decision. He was sentenced to be hanged on the 26th, having been given two days in which to arrange his affairs and write to his family; in the meantime being turned over to the custody of some men who volunteered to guard him. During the night of the 24th, through the collusion of a prominent man in town, and a physician at that, his guards were bribed and he got away, stealing a wagon and a pair of mules to facilitate his departure from Denver which never harbored him again. Some later incoming people reported having met him far down the Platte, and stated that he had boasted to them of his crime and of his escape. The citizens here were greatly exasperated over this case, and bitterly reproached themselves for not having hanged Hadley while they had him.

North side of Blake street between Fifteenth and Sixteenth in the early Sixties.

A conspicuous devil of those days in Denver was one Charles Harrison, who was a leader among his associate gambling desperadoes. On July 12th Harrison was playing cards in the "Cibola Hall" saloon and gambling house on the Auraria side. A negro named Stark entered the place and proposed to join Harrison in the game. This enraged the desperado who said he did not wish to be insulted by a "nigger," and told Stark he would give him about as much time to take back what he had said as it had taken him to say it. Stark, who was a big, burly fellow, replied that he would take nothing back, and that he was just as good as a white man; whereupon Harrison jerked out his revolver and shot the negro three times. Stark died of his wounds on the 21st. He had bought his freedom from his Missouri master, and after coming to Denver in 1859, had picked up the trade of blacksmith. Harrison afterward claimed that Stark first drew a weapon, and that his act was in self-defense. Strangely enough, no arrest of Harrison was made nor was there any attempt to bring him to trial. He figures still further in these bloody annals.

The next act in the fearful drama, after Harrison killed Stark, was one of the most thrilling, throughout its long stages, that is found in the early annals of Denver. James A. Gordon, a young man still "in his twenties," was one of the desperate scoundrels then infesting Denver. He had the heart and mind of a fiend when drunk, and his reputation as a desperado accredited him with having killed three or four men before he came here to enter upon his Denver career of crime. On Wednesday evening, July 18th, he "liquored up" and started out to make trouble for somebody. Entering a house of evil repute on Arapahoe street, he wantonly shot down its barkeeper, a young man named Frank O'Neill who, despite his occupation and environments, was not an offensive man. O'Neill afterward recovered from his severe wounds. On Friday evening, July 20th, Gordon again set out on a murderous foray. Entering "Denver Hall," which had become a vile drinking and gambling place, he encountered a low character and loafer commonly known as "Big Phil." A few words passed when Gordon drew his revolver and shot twice at the man. "Big Phil," being of no particular value, escaped injury and made off at the top of his speed.

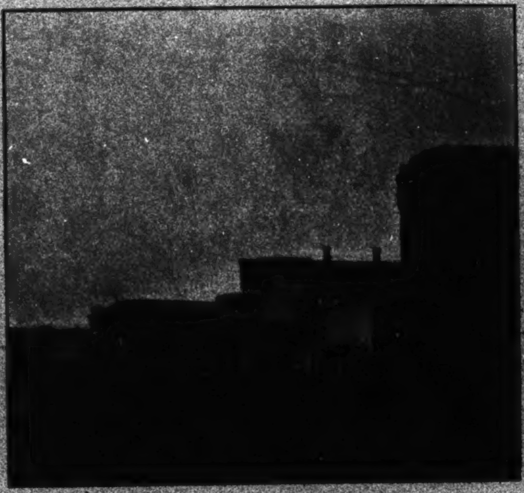
From "Denver Hall" Gordon, after a few rounds of drink, went with two companions named Fitzpatrick and Rookerbone, to the "Louisiana Saloon" which stood in the bed of Cherry creek at the Blake street crossing, and called for more liquor. Standing in the saloon was a young German named John Gantz, a stranger in Denver, who had recently come from Leavenworth where he was very well and popularly known. After drinking, Gordon and his companions broke their glasses on the floor and then, without warning or provocation, Gordon struck Gantz and knocked him down. Gantz jumped up and ran out of the place, but Gordon followed and caught him, dragged him back, again knocked him down, and then sitting on the prostrate man, held his head by the hair and shot him through the brain, after having four times ineffectively snapped the revolver. Gantz died instantly.

Gordon immediately fled and took refuge in Fort Lupton, some distance north of Denver, and then used by Blake and Williams as the headquarters of a large ranche. A party of pursuers, headed by a citizen named Babcock, followed him and surrounded Fort Lupton, when Gordon rode out on a fleet horse and dashed away. A shower of bullets whizzed about him but he made his escape to the eastward. Three of his pursuers, including Babcock, took after him on horseback and within ten miles came within shooting distance. They fired and disabled the murderer's horse, but Gordon escaped on foot, secreted himself, and afterward made his way toward the Indian Territory.

In the meantime public feeling in Denver was aroused to the highest pitch. A citizens' meeting was held and a large sum of money contributed to pay the expense of following and capturing Gordon wherever he might be. W. H. Middaugh volunteered to follow and capture the outlaw. Proceeding to Leavenworth he had himself appointed Deputy United States Marshal, obtained a warrant and in company with a Leavenworth Deputy named Armstrong, set out to find Gordon, whom they captured on the prairie, near Humbolt, Coffey county, Kansas Territory. Instead of bringing him direct to Denver they took him to Leavenworth. There the United States court set him at liberty upon a writ of habeas corpus sustained by technicalities. Leavenworth contained a considerable German population which, after learning the atrocious character of Gordon's crime and the identity and nationality of his victim, assembled in a mob, seized the murderer and three times had a rope around his neck, in frantic determination to hang him then and there. But his Denver pursuer assisted by the Leavenworth officers, rescued him each time. Every shred of clothing was torn from the miserable wretch, and his body covered with bruises from kicks and blows received in the scuffling. He begged his protectors to give him up or kill him at once.

The officers succeeded in getting him away from the mob and took him to a hotel, whence he was taken to a military prison by a detachment of United States troops. The authorities at Leavenworth refused to allow Middaugh the custody of Gordon, therefore he at once started for Denver by coach to obtain authority for bringing the outlaw here. Affidavits and other evidence of Gordon's atrocious crime were prepared, and Middaugh with several witnesses went back to Leavenworth where, after some delay, the prisoner was turned over to him. The party returned to Denver with the prisoner without noteworthy incident, arriving here at 2 o'clock in the morning of Friday, September 28th. Gordon's hands and feet were manacled and the shackles attached to a heavy chain fastened about his waist. Middaugh had traveled between two thousand and three thousand miles in his journeys, all the expenses of which were promptly and willingly defrayed by voluntary contributions by citizens.

Arrangements for trying Gordon were made on the day of his arrival, a preliminary meeting of citizens being held under a cottonwood tree near the corner of Wazee and Sixteenth streets, for that purpose. The People's Court assembled the next day with A. C. Hunt as Presiding Judge, and Charles Bartlett and William Person as Associates. Gordon's counsel were S. W. Wagoner, J. H. Sherman, H. R. Hunt, W. P. McClure and John C. Moore. The people were represented by Hiram P. Bennet, James T. Coleman and Jacob Downing. Judge Bennet and Major Downing are still living in Denver. The trial, which was held in the grove below Wazee street, between Fifteenth and Sixteenth streets, lasted until the following Tuesday afternoon, October 2nd; the Court adjourning over Sunday. The evidence was direct and conclusive, and the jury found Gordon guilty of willful murder. To hear the verdict a great crowd assembled in front of Nelson Sargent's Tremont House in Auraria. There was a balcony in front of the hotel, and on that the Judges stood, and after submitting the verdict to a vote of the assemblage, which was almost unanimously affirmative, Judge Hunt sentenced Gordon, who stood in the street



South side of Larimer street eastward from Fifteenth in the early Sixties.

below, to be hanged on the following Saturday afternoon.

The desperado was given more than the usual time in which to prepare for death, in the meantime being carefully watched by a strong guard of armed sentinels against rescue by his friends. On October 6th he was executed on a scaffold erected on the east bank of Cherry creek in the rear part of what later became Governor Evans' homestead lots at Fourteenth and Arapahoe streets, and not far from the spot occupied by the scaffold on which Gredler had been hung on the 15th of June; Middaugh acting as executioner at the prisoner's request.

Gordon was interested in the "Cibola Hall" drinking and gambling den in Auraria, which had been used for theatrical purposes in the previous year. He was only twenty-three years old, and when sober was intelligent and well-behaved, though naturally a desperado. In consequence of his youth and reputed kindness to his aged father and mother, some sympathy was aroused for him, but it availed nothing.

Considered in all its aspects Gordon's case was the more remarkable of these crimes and their punishment. The wantonness of his offenses, the determination and persistence of his pursuit, his rescue from the Leavenworth mob, his return to Denver for trial and execution, combined to make it one of unusual interest. No Court in the world could have acted with more fairness than the one which ended his career. No tribunal of the people ever bore itself more admirably, or executed its stern decree with greater firmness, notwithstanding the entreaties for mercy inspired by misplaced sympathy, and the many threats of rescue and vengeance by Gordon's criminal associates and desperado kindred.

Pending Gordon's execution his friends had made every effort to save him, and a petition to that end was circulated for signatures, but to no purpose. Thomas Warren, who had lost some of his standing as a citizen, was active in the outlaw's behalf. He quarrelled with R. E. Whitsitt who was always for maintaining order at any cost, and challenged him to fight a duel. Whitsitt at once accepted, but the affair was prevented by other citizens.

A tragic sequel came about three years later and brought death to the intrepid Middaugh. He was travelling on his way to the Missouri river and when near Julesburg was assassinated from an ambush. The deed was attributed to some one of Gordon's friends, several of whom had vowed to avenge his death, but who actually fired the shot was never known.

While Gordon's first pursuers were tracking that wretched man they incidentally transacted some effective business with three other but lesser scoundrels whom they encountered down on the South Platte. These were Jesse Ogden, Frank Milligan and Samuel K. Dunn, a trio of well-known horse-thieves, who broke and scattered as soon as they saw Babcock's party and comprehended what it was. Ogden escaped and was not seen again in this part of the country; Milligan was drowned as he attempted to escape by swimming the river; but Dunn was captured. This worthy promised to leave the country and never come back, if his captors would liberate him. They brought him to Denver, where he was tried, and sentenced to receive twenty-five lashes on the bare back, and be banished. Dunn collapsed under the first dozen lashes and the rest were not inflicted. He then eagerly left town and never more appeared in these parts.

The Rocky Mountain News in its issue of July 25th vigorously denounced the murderous deeds of that month, as it had the others which had preceded them. It denounced the vile "Criterion Saloon," in which the worst of the gamblers and desperadoes made their headquarters, as vigorously as it condemned the crimes. This notorious resort, started by Ned Jumps in 1859, stood on part of the ground now occupied by the Railroad Building, on the north side of Larimer street near Fifteenth, but Charles Harrison had, in the meantime, become the keeper of the place. The attitude taken by the News came near costing its fearless editor his life. After that issue of the paper Harrison and his associates at the "Criterion"—which was a criterion for everything bad—vowed vengeance on the newspaper and its editor. On Tuesday morning, July 31st, a horde of them were congregated there drinking and otherwise preparing themselves to execute their threats. About the middle of the forenoon a deputation of these scoundrels headed by Carroll Wood and including George Steele, both desperadoes, set out from the "Criterion" and boldly proceeded to the News office which was then located in a frame building in the westward side of the bed of Cherry creek, at the Market street crossing. Here they seized Mr. Byers and by force dragged him up to the "Criterion." When they entered the News office Captain George L. Sanborn, then working at one of the cases as a compositor, ran up stairs into the attic, got his gun which he aimed down between the joists threatening to shoot Steele if Mr. Byers would give the word. The editor told him not to shoot, and went with his captors.

When captors and captive arrived at the "Criterion" the crowd of drunken wretches declared that Byers should be killed. Harrison was there, and after roughly ordering Steele and Wood to stand aside, took Mr. Byers into a back room and thence to a back door, telling him to return to his office and shoot the first man who molested him. Harrison at that time regarded, or pretended to, the News' strictures good-naturedly, and to this day Mr. Byers considers that he owed his life to the desperado's action, whatever the motive may have been. Soon afterward, Harrison professed friendship and regard for the fearless editor, and in token thereof had made a large gold ring which he presented to Mr. Byers and which the latter still preserves. Harrison, though a thorough desperado, had kept a few good qualities in his blood-stained character.

As soon as Wood and his party learned that Harrison had let Mr. Byers out the back way they determined to make an attack on the News office. Mr. Byers in the meantime had returned there and he, with the others employed in the office, barricaded the doors and windows in preparation for an attack. Wood and his followers left the "Criterion" and went down on Market street where they took a position behind a log building about fifty yards from the News office and kept sharp watch for an opportunity for a shot at Mr. Byers or one of the other inmates. No chance presenting itself, Steele, growing impatient, mounted Wood's horse and rode past the building. After he had gotten fairly by he turned in the saddle and fired two shots into the office, which hit no one. Sanborn, and John L. Merrick who, also, was then one of the News' compositors, returned the fire. Merrick's shot caught Steele under the arm and passed through his body. The desperado reeled but did not fall. Crazed by drink and his wound, Steele rode rapidly down Thirteenth street, crossed the Platte river bridge, turned to the right to the other bridge which he crossed, and then galloped up Sixteenth street.

In the meantime tidings of what had happened spread quickly through the town and citizens were arming themselves for a reckoning with the desperate ruffians. One of these citizens was the brave and ready Thomas Pollock, the Auraria pioneer blacksmith. Pollock mounted a horse and started eastward on Blake street to intercept Steele, which he did at the corner of Sixteenth, and brought the desperado down with a charge of buckshot in the head. Steele tried to shoot Pollock, and both fired at nearly the same time, but Pollock made the better shot. Steele tumbled off his horse, and was later taken to the pioneer "City Hospital" where he died that afternoon. His body was buried in the old cemetery out on Capitol Hill, and after the "funeral" the usual untrue story about having been "a good, clever fellow when sober," was told of him.

When Wood and his confederates saw Steele shot from the News office, and a few minutes later learned that he had been brought down by Pollock, they fled into hiding from the wrath of the aroused and outraged people. All of them were captured that day and evening. Wood, having been regarded, next to Steele, as the worst of the party, the voice of the people was for instantly hanging him. But it was later decided to give him a trial. A court was organized with S. W. Beall as Presiding Judge, and a jury of twelve men. Judge G. W. Purkins rather lukewarmly prosecuted the case, and Wood was defended by John H. Sherman, J. C. Moore, and A. C. Ford. It was a tedious trial, and the jury after a long wrangle, reported that no agreement could be reached; eleven men being in favor of hanging and one opposed to it. Judge Beall then submitted the case to the crowd—whether the punishment should be hanging or banishment. Wood's friends had packed the room, and there was a majority vote for banishment. Wood had previously begged that he might be permitted to leave the city and country, and this decision of the majority was agreed to by the others. He was profuse in his thanks, declared that the whole affair and this leniency had taught him a lesson he would never forget, and that thenceforth he would be a changed and better man. So, he went away, but did not reform. He turned up early in the civil war as a Confederate guerrilla, and became a noted and cruel leader of bushwhackers in Missouri. He survived the war to be killed in 1865 by a comrade in a drunken brawl in Texas. Wood's associates in the attack on the News office were ordered out of the city and country by the People's Court and immediatey obeyed the command.

According to Richardson, who was sojourning here in 1860, and again in 1865, there was a thrilling sequel to the death of Steele. Richardson says Steele had a brother who resolved to take the life of the worthy man who tumbled the desperado from his horse near the corner of Blake and Sixteenth streets. The brother made no secret of his intention, and for two years he and his intended victim were on the outlook for each other. Once they met on a highway, each armed with a rifle, but before the would-be avenger recognized the other traveler the latter's weapon was leveled. With rare magnanimity the threatened man told his adversary to pass, but held the rifle on him for instant use until the retreating figure was out of range. Subsequently the two met face to face in New Mexico, but the brother was not quick enough, and then and there he met the same fate that befell his relative in Denver on that summer day in 1860. The survivor of this encounter was long a respected citizen here, esteemed for his sterling qualities and for his services to the community in these tragic affairs.

Between the time of the attack on the News office and the return of Gordon, there occurred a series of three executions that were, in many respects, more extraordinary than any of the others we are considering; and as the offenses charged against the men were parts of an organized system of robbery, if not of graver crimes, the cause and manner of their taking off may properly be considered in one account. In the summer of 1860 the thefts of horses, mules, and oxen in and near Denver, and along the routes of travel, rose to alarming proportions, and by August had become of wholesale character in and near the city. In the last week of that month, upon different nights, twenty-six horses and mules were taken from Bradley's ranche, thirty-three from Mallory's, and forty-seven from Kershaw's.

The despoiled owners arose in arms, and on Saturday, September 1st, near the headwaters of Cherry creek, captured a man with several stolen horses in his possession. This thief proved to be a white man who had for some time been in and around Denver, but was known only by the nick-name of "Black Hawk." We have heretofore mentioned him as possibly having been the person of that nick-name who was with Jackson and Golden in the winter of 1858-59. "Black Hawk" was brought to Denver and confined in the cellar of the Cherokee House, on the southwest corner of Fifteenth and Blake streets. On either that Saturday night or the next day his case was investigated by a secret tribunal or a secret meeting of a Committee of Safety, and he was condemned to be hanged. On Sunday night "Black Hawk" was taken up Cherry creek to a spot not far above the present location of the Chutes Park, and there hanged to a cottonwood tree. No one knew who participated in his trial or in his execution.

Northwest corner of Fifteenth and Larimer streets in the early Sixties.

In his terror after his capture, "Black Hawk" confessed that he was a member of a great organization of horse-thieves that operated through the country all the way across from southern Wisconsin to Denver; that the organization was divided into districts with a leader or Captain at the head of each; that Denver was the headquarters of the western district, with A. C. Ford in charge, and one John Shear as his lieutenant; that stock stolen in one district was passed along through the others until it could be safely disposed of; and that all taken here on the western end of the field of operations was usually run down into the Indian Territory and sold.

"Black Hawk's" confession was believed to have accounted for the retail and wholesale stealing of stock that summer. What evidence there was, other than his confession, to implicate Ford and Shear in the operations of the extended association, was never publicly known. As the reader will have learned, Ford was a rather prominent lawyer here. He came to Denver in 1859, was a man of decided ability, and by his acquaintances frequently called "Judge." Whatever of truth there may have been in "Black Hawk's" confession, it was certainly true that Ford had acted as the habitual professional defender of the thieves and scoundrels by which the community was beset in 1860. Without having openly committed any flagrant act himself, he had become regarded as the counsellor, guide and friend of those who did, and could usually produce evidence to extricate his clients in an emergency. Furthermore he had made himself an object of suspicion to many citizens who believed he regularly shared in the proceeds of much of the thieving that was going on in the town. Still, he was a man of agreeable manners and very pleasant address. Shear, who was a big, fat and rather dissipated man, had come to Denver in the spring of 1859, and in December of that year had been elected a member of the City Council under the "Jefferson Territory" "charter;" a position he still nominally held. He made his home at the Vasquez House on the Auraria side, gambled some, was usually well supplied with money, and was an associate—a sort of factotum—of Ford's.

The secret Tribunal that tried and condemned "Black Hawk," also decided that Ford and Shear should be executed. So, late on Monday night September 3rd—the night after "Black Hawk" had been disposed of—Shear was taken from his bed, hauled to the bank of the Platte river, just above the Larimer street crossing, and hanged to a leaning cottonwood tree. As in the other case, the public had no knowledge of the identity of those who condemned and executed him. When his body was found next morning, a note scrawled on a scrap of paper and fastened to a stump near by, was also discovered, and which read: "This man was hung. It was proved that he was a horse-thief."

On that Monday, when Ford heard of "Black Hawk's" execution, he at once began preparations for flight. He engaged passage to the Missouri river on the stage due to leave the next morning; but his intentions were soon known to that grim Committee, or Tribunal, whichever it may be termed, and Ford's willingness to leave town, and indicated desire to get away in haste, did not avail him. It had been decreed that he should not escape to become an enemy of society in another community, and that nothing he could do should avert the tragic death to which he had been doomed. Preparations to intercept him in his flight were promptly made; nine men being detailed to that duty, on Monday night. This party was divided into two mounted groups, one of four members and the other of five; and about two hours before dawn next morning they left town, a group on each of the two stage routes to the east. The smaller group went out the old "cut-off" road to a point not far beyond the eastern limits of the present suburban town of Montclair, and about seven miles from the Denver of those days. There they awaited the coming of the morning east-bound coach. It came on time, and when they halted it they found Ford among its passengers, the others of whom at once became greatly alarmed by the stoppage. Ford was cool, and quietly left the coach when he was told to do so; and the driver was then ordered to proceed on his journey, which he did without delay.

Ford was taken nearly a mile from the road, to a little slough or depression where the grass was high, and there summarily shot; his body being left where it fell. Ford died bravely, but without bravado. On September 8th the body was found by one of the parties which had been searching for some trace of the rather prominent lawyer who had so mysteriously disappeared. The breast was riddled with buck shot.

Those who found the body discovered that some one had preceded them, and had taken from it whatever of value there was upon it, including a fine gold watch Ford was known to have carried. The Denver Tribunal soon learned that an individual had left town the day after Ford's death, and suspected him of having first discovered the body. A member of the Committee was put on his trail and tracked him all the way to El Paso, Texas, eight hundred miles distant, hunted him down, found the watch in his possession and made him give it up. It was brought back to Denver and delivered to Ford's widow who had come here from Council Bluffs after his death. Ford had served as a delegate in one of the "Jefferson" conventions, and it was reported here at that time that he had been a "Free Will Baptist" preacher in Iowa before he came to Denver.

Who constituted that grim Tribunal that condemned and executed these three alleged members of the alleged great western association of horse thieves, no one undertook to inquire. Many could have closely guessed; while, of course, some certainly knew. However, it was then sharply understood to be a forbidden topic, and no one cared to disregard that understanding. These circumstantial details were related to the writer by a low-voiced, gentle-mannered pioneer, of those times, who is still a well-known and much esteemed citizen of Denver, and is the only one of Ford's four executioners now living.

Ruffianism, as the reader has seen in the case of the "claim-jumpers," was sometimes encountered in quarters where it might not have been expected. Richardson thus accounts the circumstances of another of these affairs:

> "The Denver people, tired of improvising a vigilance committee after every outrage, organised a city government and elected a full board of officers. The desperadoes—like most scoundrels, great sticklers for legality—refused to recognise its validity. The correspondent of the St. Louis Democrat excited the ire of one of Buchanan's shining appointees, the Denver postmaster, who was also Chief Justice of the embryo commonwealth, under a movement for a State government. One evening this functionary lured the journalist into the post office; then closing the doors, with a cocked revolver at the head of the luckless scribe, he compelled him to write and sign a statement that he knew his published allegations to be false and slanderous when he made them. Under that influence which knows no law, the correspondent made this 'voluntary' retraction. But the people took the matter in hand, and after a fierce struggle, the postmaster, who was a man of wealth, and sustained by all the leading desperadoes, as his only mode of escape from the gibbet, succumbed to the city government, and gave bonds to keep the peace. In the great war he turned up a quartermaster in the rebel service."

W. P. McClure was the Denver postmaster at that time, and O. J. Goldrick the intimidated journalist. However, Richardson was in error in making McClure "Chief Justice of the embryo commonwealth." McClure armed and intrenched himself in his postoffice with several of his equally armed friends, and defied the officers who went to arrest him on November 5, 1860, charged with assaulting Goldrick with intent to kill. He practically dictated terms for settling the matter. McClure was prominent and influential in the community in those times. His tragic fate in the Confederate service will presently be related.

On November 30th Patrick Waters shot and killed Thomas R. Freeman down on the South Platte, two miles below Fort Lupton. The two had gone there after a load of hay. Waters hid Freeman's body, and taking the horses escaped to Nebraska. He was followed by W. T. Shortridge who captured him and brought him back to Denver. He was tried by a People's Court which, with grim significance, assembled in "Criterion Hall" and was presided over by William Person, with E. H. Hart and General F. J. Marshall as associates. H. P. Bennet, L. L. Bowen and J. B. Smith were the prosecutors, and J. J. Hall and C. C. Carpenter counsel for defendant. Waters confessed his crime to have been a premeditated, cold-blooded murder, was found guilty and sentenced to be hanged on December 21st. A gallows was set up on the north bank of the South Platte river near the end of the present Fifteenth street bridge, and from it Waters was promptly swung into eternity on the day set for his departure. This was the last execution in Denver's history by mandate of a People's Court.

though there was a case or two in the interval before the organization of the Colorado Territorial government a few months later, that would seem to have afforded cause for further application of the extreme penalty by the people. The jury that rendered this last capital verdict consisted of J. B. Carter, George T. Clark, William Clayton, L. N. Greenleaf, John Herman, M. A. Hines, C. H. McLaughlin, E. McLaughlin, "Count" Murat, James Stewart, J. S. Travilla, and George Wakely.

On Sunday, December 2nd, Charles Harrison shot James Hill in the "Criterion Saloon." Hill, who was of Harrison's kind, died the next day. His slayer was arrested, tried on the charge of murder to which he pleaded not guilty, and was acquitted upon the proof of self-defense he succeeded in presenting. After this affair Harrison boasted that he intended making his record twelve white men so that he could have a jury of his peers in "hell," as he did not count the eleven Mexicans he claimed to have killed, nor the "nigger" who had died at his hands in the previous July. It was said of him that he had killed three or four men in Salt Lake City before he came to Denver.

South side of Larimer street from Fifteenth to Fourteenth in the early Sixties.

On December 14th Patrick Kelley killed Richard Doyle in the "Club House," an eating and drinking place at the corner of Fifteenth and Market streets, of which the two men were partner owners. A dispute about their business affairs brought on an affray which resulted in the homicide. Kelley was tried in the "Jefferson Territory" Appellate Court, charged with murder, and set up the plea that if he were guilty of any crime, it could not under the circumstances have been of greater degree than manslaughter. The Court construed the "law" under which it acted as conferring jurisdiction only in cases of first degree murder and so instructed the jury, which returned a verdict of not guilty as charged in the indictment. Kelley was released and that was the last of the case.

A short time after Harrison killed Hill in the "Criterion Saloon" he disappeared from Denver. The civil war had then become almost a certainty, and its prospective strife promised abundant satisfaction to his love for bloodshed. Harrison, W. P. McClure and several others from this city joined Sterling Price's army then organizing in Arkansas. In 1862 they persuaded Price that they could easily raise a Confederate regiment in Colorado. Therefore commissions were issued to enough men to make a full complement of regimental officers, and the party started for Colorado to recruit the regiment. The Federal authorities heard of the movement and sent a mounted detachment of enlisted Osage Indian scouts to capture or destroy the band of newly-fledged Confederate officers. The party was intercepted on the southeastern plains and in the fight that ensued its every man was killed, Harrison and McClure among the rest. The Osages cut off the heads of all and carried them back as evidence that orders had been executed to the very letter, and that Harrison had gone to meet his jury down below.

Of the people's methods during those trying times in 1860, Mr. W. N. Byers recently said:

> "We never hanged on circumstantial evidence. I have known a great many such executions, but I don't believe one of them was ever unjust. But when they were proved guilty, they were always hanged. There was no getting out of it. No, there were no appeals in those days; no writs of errors; no attorneys' fees; no pardon in six months. Punishment was swift, sure and certain. Murderers almost always confessed their crimes."

It may be incidentally remarked here that a peculiarly grim practice attended the executions by hanging. To the simple mechanism by which the trap was released a long rope was attached and of which all the jurymen in the case took hold. At a signal from the nominal executioner the jurymen pulled the rope and thus actually inflicted the penalty their verdict had warranted.

The majesty of aroused, outraged public sentiment; the quiet, awful determination of those Courts of the People; and the swift, terrible and unrelenting execution of their irrevocable decrees, appalled the more wanton ruffians and brought to their brutal minds a shivering conviction that they could not successfully defy the whole community. Though most of them oft-times boasted of their preference for dying with their boots on, the sight of yesterday's comrade in deeds of crime, hunted down and shot to death as a ferocious wild beast would have been, as had been the case with both Steele and Ford; or kicking and struggling in midair from the end of a rope as they had seen or known many others to perish, was more than they could bear; especially when each was conscious that it might justly be his turn to next present the same ghastly spectacle to his surviving associates.

These executions in 1860 were not the work of mobs, but that of organized tribunals the proceedings of which, with such exceptions as those of "Black Hawk," Shear, and Ford, who were secretly, and no doubt justly, condemned to death, and that of Steele who was killed in the progress of his murderous foray, were public. Aside from these cases there was not a single instance of execution in or near Denver in that period without public trial and without public knowledge. Later, in that decade, as related in succeeding chapters, there were some instances of what may be called lynching. Many and grossly exaggerated versions of the events we have here been considering and which, in themselves and strictly within the bounds of truth were tragic enough, have been spread over the first three or four years of Denver's history, and have created a belief that it was not unusual, during those years, when the Denver people went forth from their homes in the mornings for them to see the body of a man suspended from a limb of a tree. Such stories of pioneer times in Denver are, with the possible exception of Shears' body having been seen from some distance, pure fiction. But it was a tribute to the forbearance of the people of those times that the trees did not more frequntly bear in the mornings fruit that was not on their branches the night before; for the worthful citizens were daily tormented by thieves, exasperated by the carousals and brawls of drunken ruffians, and provoked by the conduct of the gamblers, swindlers, and other human riff-raff that beset them on every side.

It is not to be understood that the People's Courts of 1860 succeeded in permanently suppressing murder and other forms of crime in Denver. They did, however, have a powerful restraining influence in checking the impulses of those inclined to flagrant deeds of violence. With 1861 came the Territorial Government of Colorado with all its machinery and forms of established law, which theoretically removed necessity for further spontaneous action of the people as crystallized in the People's Courts.

CHAPTER XXXVI.

COMMERCE OF THE PLAINS—ITS MAGNITUDE—OVERLAND STAGE LINES—FIRST LINE TO DENVER—TROUBLE IN ESTABLISHING UNITED STATES MAIL TO AND FROM CHERRY CREEK—FIRST POSTMASTER—VOLUME OF EXPRESS MAIL MATTER—POST OFFICE ESTABLISHED ON "DENVER CITY" SIDE—TRAVELING BY STAGE—CENTRAL OVERLAND, CALIFORNIA AND PIKE'S PEAK EXPRESS COMPANY—FAMOUS PONY EXPRESS—FINANCIAL MISFORTUNES—OLD-TIME STAGE COACH MEN—HOLLADAY OVERLAND MAIL & EXPRESS COMPANY—OTHER OVERLAND LINES—LOCAL STAGE LINES.

The "commerce of the plains" began at an early day, originating in these parts in the operations of the fur companies. Until Denver was founded there was not much of it in the Pike's Peak region, the business passing to and from either the northwest or southwest. From Independence, Missouri, the southwestern traffic followed the old Santa Fe trail; while that destined for Utah, California and Oregon went to the northwest by way of the South Pass. Some from the southern trail passed this way to the northward, but that happened only occasionally. The acquisition of territory from Mexico was followed by a large increase in the traffic, and the California movement in and after 1849 swelled it tremendously; but, little of the increase passed through this locality.

The establishment of United States military posts, such as Forts Union, Laramie, Massachusetts, Bridger, and others farther west called for the transportation of great quantities of supplies, and by the time of the so-called "Mormon War" the government's freight made business for a large number of men.

The foremost of the freighting contractors west of the Missouri river in that period was the firm of Russell, Majors & Waddell. In 1858 these men employed in the regular operation of their business, twenty-five thousand oxen and two thousand wagons, transporting freight, chiefly on government account, to various posts and places between the Missouri and Salt Lake. Of their operations upon one special occasion Fossett gives these particulars:

"W. H. Russell of the leading trading and shipping firm of Russell, Majors & Waddell, received a contract to transport the supplies for the entire army destined for Salt Lake, as well as for intermediate posts. This required 60,000 head of cattle, 6,000 wagons and about 1,000 mules, which was subdivided into trains and let to Missouri farmers and freighters. Each of these trains consisted of twenty-six wagons, three mules and about thirty men, with six yokes of cattle to each wagon."

This firm figured in still more important enterprises in the west, as we will presently see. Concerning its operations Fossett further says:

"In 1860 one herd of 4,800 cattle belonging to Russell & Co., were frozen to death in three days in what is now [1876] known as Skull Valley, Utah. When informed of the loss * * Russell made no other remark than 'send the hides and horns east by return (wagon) trains.' These facts are given to show the character of the man and the magnitude of his operations."

But the aggregate of all previous traffic over the plains sunk into insignificance when compared with that which followed the discovery of gold in these mountains, and the founding of Denver. Hauling supplies overland by teams for a small army made a great deal of business, but it was a bagatelle in comparison with that of transporting material for the building and furnishing of a city, and supplies and provisions for not only the people who were building it, but for thousands who were after the golden cause that had called it into existence. Those were the times when the "commerce of the plains" of the old-time "prairie-schooner" variety reached the furthermost bounds of its expansion. The slow-gaited "prairie-schooner" was the contemporary of the overland stage, and they rose, flourished and passed away together. Occasionally, a lone white-topped wagon, the outfit of some restless adventurer, may still be seen creeping along a roadway of the plains, but such sights are now becoming few and far between. These vagrant vehicles bear slight resemblance to the huge, old-time "schooners," drawn by five or six yoke of oxen, or as many pairs of mules, and carrying four or five tons of freight.

They usually went in trains, sometimes as many as thirty-five or forty wagons in a caravan. As a rule there were ten head of animals to each of the large wagons in the trains of the regular freighting contractors, and extra cattle or mules were taken along to fill out the teams in case of death or disability among their members. Each wagon had a man to manage its motive power, and three or four additional train-men were employed in attending to the extra stock, and to miscellaneous duties, the whole outfit being in charge of a wagon-master, or conductor, who was its responsible head. Sometimes such a freight-laden caravan would stretch out for a mile or more in length.

The emigrant wagons, while usually traveling in company, moved more independently and with less system in their progress. Their aim was to get through the best way they could, and the ignorance or impatience, and often both, of their individual proprietors controlled their movements. But with the regular freighting people things went differently and very systematically. With the larger trains provisions were carried in one or two lighter wagons, which also served as ambulances in case of illness or accident, and often carried a passenger or two not in a special hurry to get through. The men of the train were divided into "messes," and each mess had its camp outfit. When camp was made in the evening the wagons were usually driven up together so as to form an enclosure or corrall. When there was no fear of the Indians, the wagons were placed so that the tongues or poles were turned to the outside, the right front wheel resting against the left hind wheel of the wagon next ahead. This left the stock all outside of the corrall for convenience in unhitching, and driving the animals to water and grass. When Indians were menacing, the wagons were assembled with the tongues inside the corrall which brought all the stock inside and prevented the animals from being stampeded in case of attack. The wagons also made good defensive protections, and the hostile Indians were cautious about coming near them.

The prairie freighters observed the old rule of early to bed and early to rise, getting a good morning start and usually halting for a few hours in mid-day, for the stock to water and grass. The usual rate of progress up the Platte Valley was between ten and fifteen miles a day. Notwithstanding the heavy expense, the wear and tear, and the danger and loss at times occasioned by the Indians, the business was a profitable one, for freight charges were high and there were no rate wars between rival transportation lines.

From necessity the trains returned to the Missouri river empty, or nearly so. All the traffic, it may be said, was westward and the charges upon it had to be made high enough to cover the round trip expenses of the trains. Some idea of the magnitude of the business may be formed when it is considered that provisions, clothing, mining machinery and supplies, building hardware and other material, merchandise of all sorts for the people of Denver and the thousands in the surrounding region of which it was the metropolis—and an extravagant, wasteful lot of people they were—all had to be wagoned from the Missouri river, until the railroads made their way westward. In the summer of 1860 the rates of freight from the Missouri river across the plains to Denver were from ten to twenty cents a pound—not a hundred weight, but a pound of sixteen ounces, and there was an enormous business going on. The outbreak of the civil war checked it as it did everything else, but after the war was over, it rose to greater proportions than ever. It was estimated that in 1865 five thousand men and forty thousand mules with a proportionate number of wagons were regularly employed in freighting on the plains, the government freight in consequence of having many new military posts in the west and because of troubles with the Indians, furnishing a large portion of the tonnage. As the railroads pushed themselves westward after the war, the "prairie schooners" plyed to and from the advancing termini of the roads, completing the unfinished transportation, until the railways came through and swept the wagon-master and his picturesque caravan into retirement from which they will come forth never again.

Freight caravan on the Plains.

The overland mail and stage line on the central route had its beginnings at the California end. As early as 1851 the mail had been carried on mules and afoot between Sacramento and Salt Lake by Woodard & Chorpenning. By 1858, Chorpenning & Company, through combination of different local lines in California had a local mail and passenger line of coaches running to Salt Lake from the coast, but its mail contract required the transportation of mail between Salt Lake and Sacramento only once a month each way.

At that time there was a line of coaches running from Independence, Missouri, to Salt Lake, by way of Fort Kearney, the Platte valley and Fort Laramie; and known as the "Hockaday Line," from the name of its principal owner, John Hockaday. It was not a robust establishment though it had been in operation several years. It had a contract to carry mails between Salt Lake and the Missouri river six times each way between the first of May and the first of November, and three times each way between the first of November and the first of May; a total of nine mail trips each way during the year.

As will be seen, these were, in their true character, local lines and their mail contracts were for local mails, none of which were for any point in Colorado, for the good reason that there was then no Colorado, nor was there any "point" here or anywhere near here until near the close of that year. These lines connected at Salt Lake, and California passengers went through by them, but having no through mails, and being separate local establishments they can not be said to have constituted a transcontinental line, in the sense that the southern, or Butterfield, line was such. At this time the greater part of the mails for California were carried by the Pacific Mail Steamship Company by way of the isthmus, from New York to San Francisco within limits of twenty-two days; though the Southern Overland Stage Company carried a considerable bulk of them.

That stage company operated the longest stage route in the world in the four years preceding the civil war; southwest across the plains, and through the arid regions of New Mexico to California. The route was from St. Louis to San Francisco, by way of El Paso, Texas, which was near the half-way point; the total distance along the great angle from St. Louis to El Paso and thence to San Francisco being 3,203 miles. The more direct and more practicable route would have been through this way, but the political influences dominating in Washington at that time decreed that the southern route, as it was called, be followed, through Arkansas, across the corner of the Indian Territory, through Texas and New Mexico to California. It was the first "fast line" between the Mississippi river and the Pacific ocean, and carried a limited quantity of mail twice a week each way for a compensation of $600,000 per annum. Of this first through overland mail contract and of those to whom it was awarded, the Second Assistant Postmaster General, at Washington, supplied us with the following information:

> "I have to inform you that Route Number 12,578, St. Louis, Mo., to San Francisco, Cal., 3,203 miles and back, twice a week, with a branch from Memphis, Tenn., to Fort Smith, Ark., was let by order of July 2, 1857, to John Butterfield of Utica, N. Y., William B. Dinsmore, of New York, N. Y., William G. Fargo, of Buffalo, N. Y., J. V. P. Gardner, of Utica, N. Y., M. L. Kingon, of Rome, N. Y., Alex. Holland, of New York, N. Y., and Hamilton Spencer, of Bloomington, Ill., at the rate of $600,000 per annum. By order of March 12, 1861, service of this route was discontinued."

The coaches ran with great regularity—except when interrupted by occasional Indian depredations—following a time table with such exactness that, it is related, in one season for a period of two months, the coach from St. Louis met the one from San Francisco every trip within a thousand feet of the same place midway on the long journey; and for an entire year there was not a failure to deliver the mails at either end of the line on schedule time. The through fare for passengers was only one hundred and fifty dollars, with an additional expense of from fifty cents to one dollar for each meal taken along the way. The coaches rolled on day and night, stopping only to change teams at stations from twelve to twenty miles apart—the drivers being relieved at longer intervals—and to give the passengers a chance to get something to eat. They made the trip usually in twenty-one days, although the mail contract allowed twenty-five.

The outbreak of the civil war stopped operations in 1861, and the outfit of stages and mules in Texas and other places down that way was confiscated by the Confederates. Early in March of that year, Congress by law had directed this company to change from the southern to the central route, and the transmission of mails over the southern was ordered discontinued. The further proceedings of the company will be narrated by and by.

Late in 1858 the persistent stories of gold discoveries in the Pike's Peak region and the excitement they occasioned along the Missouri river and to the eastward, had made it apparent that there would be a great movement of people to the new country in the following spring. Therefore, the plains freighting firms of Russell, Majors & Waddell, and Jones & Cartright joined forces in the winter of 1858-59, and under the firm name of Russell, Jones & Co., organized the Leavenworth & Pike's Peak Express, a line of stage-coaches to run between Denver, and Leavenworth, Kansas. It was finely equipped with fifty-two new "Concord coaches," and a full quota of the best draft mules money could buy in Missouri, Kentucky and Tennessee, and the best ever owned by any stage company. In this equipment and in stations along the way, and for the various incidentals, about a quarter of a millions of dollars were invested. It started and continued as a daily line each way, and in the summer of 1859 when the line was in good working order, the regular fare from Leavenworth to Denver was one hundred dollars including meals; and twenty-five cents per mile from and between intermediate points. We have elsewhere told of the arrival of its first coaches in Denver on May 7th, so it is unnecessary to repeat those details here. At the start the route was by way of the Republican river and north of that of the present Kansas division of the Union Pacific Railway eastward from Denver; but after running for about six weeks over that route, the line was transferred in the middle of June to the Platte valley route followed by the old Hockaday coaches on their way to the west.

The distance travelled on the earlier route from Leavenworth to Denver was six hundred and eighty-seven miles, and with four—and sometimes six—mules in the team, it was covered within seven days; usually about six hours less than seven days. In that spring of 1859, Junction City, near by Fort Riley, was the frontier post office and settlement of Kansas, and was a point on the stage line; but the company brought mail through from Leavenworth as express matter, or rather as a postal enterprise of its own. Its stations along the way were from fifteen to twenty miles apart, where teams were changed—the drivers being changed less frequently.

The first return coach of the Leavenworth & Pike's Peak Express reached Leavenworth from Denver on May 21, 1859. It carried three thousand, five hundred dollars' worth of Rocky Mountain gold dust, and its arrival there was celebrated with music, and the ponderous speeches of the time which were then always part of every public demonstration that commanded any public respect. The presence of actual gold from the new Dorado, though comparatively small in quantity, was heralded over the country from Leavenworth, and it convinced multitudes that there must be a great deal more where that had been found. As the news of this consignment spread it caused thousands to join the throng headed for Denver, and did much toward contradicting the stampeders' tales of deceit, delusions, disasters and demoralization in all the Pike's Peak region, some versions of which had already reached the Missouri that month.

William H. Russell, deceased.
(Photographed about 1870.)

The time across the plains was reduced in later years to within six days as a result of improvements made along the new routes. Richardson states that he came from the Missouri river to Denver in 1865 in four and one-half days—which was certainly not a regular schedule performance—and that the coaches were going through to a connection with the Placerville, California, railway inside of three weeks. By midsummer of 1867 the Union Pacific Railway was finished to North Platte, about halfway to Denver, and the journey from Omaha to this city was made in about three and one-half days, if the road were fair for the staging part of it.

The reason for transferring the Leavenworth & Pike's Peak line from the Republican river route to that of the Platte grew out of the purchase by Russell, Jones & Co., late in May, 1859, of the old Hockaday line running between Independence and Salt Lake, as a basis for some more extended operations they had in view, and in expectation of having its mail contract amplified to include regular mails to and from Denver. The transfer was practically a merging of the two lines, the one to Denver then being far the more important. After the change the two followed the same route between Fort Kearney and the original Julesburg, or "California crossing," where the Hockaday coaches diverged and proceeded on their way to Salt Lake by way of Fort Laramie.

We have heretofore mentioned the great satisfaction given the people here by the advent of the Leavenworth & Pike's Peak coaches early in May, 1859, carrying mail matter regularly to and from the previously isolated towns and mining camps, although a charge of twenty-five cents, in addition to the government postage on outgoing mail, was made for carrying letters either way. Within a couple of weeks the novelty of regularly receiving and dispatching mail wore off, and there suddenly broke out a tremendous clamor against Russell, Jones & Company's alleged extortionate charges. Meetings were held in the towns and mining camps, at which the stage company was denounced with all the freedom of invective possible on the frontier, and the columns of the Rocky Mountain News were burdened with complaints.

This resulted in the people here petitioning the Post Office Department to establish a Post Office in one of the two towns at the mouth of Cherry creek; and late in June, 1859, "Auraria City, K. T.," was made a Post Office town with Henry Allen as Postmaster. Allen had been Postmaster at Council Bluffs, Iowa, before coming hither. In previous historical accounts of our pioneer times, W. P. McClure has been represented as having been the first Postmaster here. This is an error; Allen preceded him by more than a year, and was appointed within eight months after Auraria had been founded.

In the midst of this clamor against them, Russell, Jones & Company had bought the old Hockaday stage line and its mail contract, with the expectation of extending its mail route by a branch from Julesburg to Denver. Negotiations to that end had previously been set on foot at Washington and were supposed to have been practically concluded, when a hitch suddenly occurred which resulted in the Post Office Department refusing to further consider the proposition. Russell, Jones & Company were so confident of securing the mail extension that they had given notice through the News that regular United States mails at regular postage rates would be inaugurated by their coaches within a few weeks.

The failure of these negotiations occurred about the time Allen was appointed Postmaster, yet no other provisions for conveying mail to and from Auraria received any attention at Washington. The propriety of establishing a Post Office and appointing a Postmaster without providing any mail facilities is not apparent at this time; but that was the way it was done. When news of the collapse of mail negotiations at Washington reached Denver, Postmaster Allen cast about for some way to get mails to and from his post office, which he had fitted up in Pollock's hotel building. Many of the people believed Russell, Jones & Company had been insincere in their endeavors to have regular mails established, and that they had preferred to retain their monopoly of carrying letters at twenty-five cents each. Under the postal regulations of that time a Postmaster was authorized to contract and pay for mail carriage to and from his office so far as the cash receipts of his office, less other expenses, would enable him to do so. Therefore, Postmaster Allen thought he had found a way to relieve the people of their cause of complaint against the stage company, as stated in the following that appeared in the Rocky Mountain News of July 9, 1859:

"Mail Notice"

> Messrs. Editors:—Please inform your readers that I have made arrangements with Mr. Willis, one of the employees of the United States Express Company, to carry the mail from Auraria to the Missouri river, the contract to commence on Monday next [July 11th], and continue to depart every Monday morning until further notice. Therefore, 3 cents postage will convey the letters to the States, and the same back, as soon as the agent gets through.
>
> July 8th, 1859. H. Allen, P. M.

At the time this arrangement was made the United States Express Company was operating as far west as Fort Kearney, over the line of the Western Stage Company between Omaha and that point. By the contract with Willis, Auraria was made the first duly established and operated United States Post Office in the entire Pike's Peak region. Commenting on these mail matters and troubles, the News in its issue of July 23, 1859, said:

> "We know of but one legally appointed Post Office with a duly commissioned Postmaster, which is in Auraria—Henry Allen."

However, the Auraria Post Office did not long survive. The Leavenworth & Pike's Peak stages had continued to carry a large amount of express mail, and at the close of July, after three weeks' service, Postmaster Allen's mail carrier abandoned his contract, and left the Auraria Post Office stranded. Concerning this and the remedy applied, we quote from the News of August 27, 1859:

> "We learn from Mr. Allen, the Postmaster, that Mr. Willis has failed to carry out the contract taken by him to carry the U. S. Mail from this office to Fort Kearney. The letter published in our last week's issue, written by Mr. Sydenham, had referred to the contract with Mr. W., and since his failure can have no reference to future mails.
>
> Mr. Allen has now entered into a contract with the Express Company [the L. & P. P.] by which the mails will be transported three times a week each way between Auraria and Fort Kearney, in U. S. Mail bags which will be opened only by the Postmasters at either end of the line. The charge will be twenty-five cents for each letter and ten cents for each paper, in addition to the U. S. postage—that being the compensation allowed the Express Company.
>
> We can now rely upon having our mails carried with promptness and dispatch, and the compensation is as little as any responsible company or individual will undertake to tranport it for.
>
> Since government has failed to extend to us the privileges and advantages of postal facilities, we are certainly fortunate in being able to secure tri-weekly service, even at a cost of twenty-five cents per letter, in the hands of so prompt a company as Russell, Jones & Company. The mail will leave hereafter, and until further notice, on Tuesday, Thursday and Saturday of each week, at 6½ o'clock, a. m.
>
> The Express Company will also carry letters and papers to and from their office in Denver, at the same rates as formerly, they paying the U. S. postage."

This terminated the career of the Auraria Post Office as an establishment of the United States, and reduced Postmaster Allen to the level of a mere agent in Auraria for the Leavenworth & Pike's Peak Express Company, in which position he continued until the appointment of W. P. McClure as Postmaster in Denver and the re-establishment of United States mails, a year later. The stage company's express mail matter was the source of an important income. On a fly-leaf of the Auraria Town Company's old record book, placed there by Allen who was an officer of the Town Company and who was probably short of account books, is the subjoined statement of account between him and the stage company, covering the first six weeks of his service as their agent in Auraria, and which serves to indicate the value and extent of the company's letter-carrying business; as it covers only that pertaining directly to Auraria. It also shows that Allen's commission of five cents on each letter handled during the six weeks amounted to nearly one hundred dollars; a larger sum than he would have been likely to have received had he continued as United States Postmaster at Auraria:

The stage company continued carrying mail both ways as express matter until past midsummer of 1860, and probably would have kept it up longer had not the shadow of a competing line appeared on the eastern horizon. Much popular discontent had again arisen over the heavy charges, and the company realized that if it did not change the methods its coming competitor probably would do so. After the inauguration of the government's new fiscal year, and with the active assistance and insistence of "Delegate" B. D. Williams, a contract was made to transport regular mails to and from Denver. By that time, as we will later see, the Leavenworth & Pike's Peak Express had been merged into the Central Overland, California & Pike's Peak Express Company.

Alexander Majors, deceased.
(Photographed about 1890.)

In preparation for re-establishing regular postal facilities to and from Denver, Postmaster Allen's commission was not revived, as it would seem it should have been, but W. P. McClure was appointed Postmaster at "Denver City." He fitted up an office in a little building on the southeast corner of Fourteenth and Larimer streets, so the Aurarians could conveniently reach it by crossing the Larimer street bridge, the only one then spanning Cherry creek. On August 10, 1860, the "Denver City" Post Office received its first installment of United States mails, and on that day the "express mail" system with its burdensome charges, finally came to an end. McClure's appointment and the location of the office on the Denver side were influenced by the C. O., C. & P. P. stage company and the Denver Town Company; the interests of individuals controlling both companies having been mutual in securing for "Denver City" all the public utilities that came along.

The competing stage line to which we have referred, was that of the Western Stage Company, an organization of which we will presently give some further account. In 1859 it had established a line of coaches between Omaha and Fort Kearney, and in the summer of 1860 prepared to extend that route to Denver. Notwithstanding the hostility of the older line and the influence of its owners at Washington, the Western Company secured a contract to carry local mails between Fort Kearney and Denver. Its first mail coach arrived here on September 21, 1860. However, this rival did not long remain a competitor of the older line. Late in 1861 it was bought out, or off, by the Overland Mail Company which had in the spring of that year, as we will presently relate, succeeded the C. O., C. & P. P. Company, and which also was then on the verge of bankruptcy; the Fort Kearney-Denver subordinate mail contract being assumed by the Overland Company. The Western Company then entered the Denver local field as will later appear.

The coaches used on the great overland lines, and nearly all that ever ran anywhere west of the Missouri River, were then known as "Concord wagons," deriving their name from Concord, New Hampshire, where they were built. The "Concord" was a perfect vehicle for the purpose. It was a compromise between the old-time heavy, lumbering, English stage-coach, itself a load for a fair team, and a good, big, covered spring-wagon; and was very light for its strength and carrying capacity. The body retained the general form of the old coach, and accommodated nine inside passengers, the driver sitting in front on the seat elevated above the passengers. There were seats with the driver for two or three people, a receptacle under his seat for packages and mail bags, and a "boot" behind for baggage, parcels, and other stuff. In durability and strength this smooth-running, easy-riding vehicle exceeded all others ever introduced in the west. Drawn by four good mules, the usual number, the ordinary average speed was from four to five miles an hour, though in emergencies double that speed was known to have been attained. The loads were always stowed to balance well, with the hand-baggage of the passengers on the roof where it was accessible to them when needed. With a fair cargo and a complement of people the coaches moved steadily; but when empty or nearly so, they pitched and plunged more than a solitary passenger would deem necessary to his comfort.

Traveling in the overland stages, especially over the plains, was a most wearisome business for the average passenger. No experience could be more trying and fatiguing than that of the first day and night in a lumbering coach. If the vehicle had a full load, as it usually did have, sitting in one position in the crowded, cramped quarters allotted to each passenger, the heat of the sun, and the dust of the trail if in summer, or the cold winds and driving snow of other seasons, combined to make a journey one long to be remembered. But the bones and muscles of the traveler seemed to become more resigned to their fate after the first twenty-four hours, and were less persistent in their protests against the unusual treatment they were receiving. It was usually the case that passengers would find the closing stages of their journey far more comfortable than the experience of the first day or two. When opportunity offered the travelers would vary the monotony of the trip by walking a mile or two; and the trip did become exceedingly monotonous. The novelty of the plains soon wore away, and their apparently endless stretches became most tiresome to the sight. One of the most confusing things to the novice was his conception of distances. Mile after mile would be traveled along the monotonous trail with some landmark in plain view ahead, and hours would pass, yet the object would appear no nearer than when first observed. The eye could not be trusted to estimate distances in the clear, pure atmosphere; nothing but actual knowledge derived in other ways enabled one to know how far one place was from another.

The drivers were, as a rule, reticent, intelligent men, attentive and courteous to their passengers; and from the necessities of their occupation, were brave and hardy. Furthermore, they were cautious in their driving, and remarkably skillful in handling their teams which were not always models of docility and tractability. Upon occasion, especially on the mountain lines, they drove along at a fine gait over and through places of apparent peril, but they knew what they were doing and how to do it. Stories of their wild recklessness, and foolhardy daring in managing the coaches loaded with people whose lives were entrusted to their care, were generally the products of luxuriant imaginations belonging to passing visitors, who wanted to recount adventures that would thrill the folks back home. These stories were usually built in between an Awful Peril the coach had just escaped, and an Appalling Danger just ahead, upon which its wild reinsman was furiously dashing with his helpless and terror-stricken passengers reviewing the misdeeds of their lives in the few moments presumably left them on earth.

As a matter of fact, the stage companies required their drivers to be careful and to avoid risks and dangers that were avoidable. They would no more entrust a coach and its load of passengers to an incompetent, reckless, foolhardy driver, if they thought him such, than the Superintendent of a railway would now put such a man in charge of the locomotive drawing one of his trains. Indeed, it is probable that those oldtime drivers had to exercise more caution, judgment, circumspection and skill, especially those employed in the mountain districts, than are demanded of the men in charge of the motive power at the head of one of our modern passenger trains; and his position, notably so in times of trouble with the Indians, was one of greater personal danger, and also one forbidding wanton recklessness.

The old freighting firm of Russell, Majors & Waddell which, with several associates, organized the Leavenworth & Pike's Peak Express, and later the Central Overland, California & Pike's Peak Express Company, and established the Pony Express, required each of their men to make the following pledge:

> "While in the employ of Russell, Majors & Waddell, I agree not to use profane language, not to get drunk, not to treat animals cruelly, and not to do anything incompatible with the conduct of a gentleman."

While it can not be truthfully said that this promise was always rigidly kept, the men who would very often violate it would have to look for some other employment. These employers in operating their stage lines required their men to follow the same general line of conduct.

Wagon Train Corrall.

Late in 1859 the owners of the Leavenworth & Pike's Peak stage and express line, and recent purchasers of the old Hockaday line to Salt Lake, formed an alliance with the Salt Lake & California Mail Company—otherwise Chorpenning & Company—which, as we have stated, was running a line of mail and passenger coaches between Salt Lake and the coast, and made arrangements with it which were the beginnings of their preparations for a transcontinental through stage line. Then, at the session of the Kansas Territorial Legislature in the winter of 1859-60 they obtained a charter for the "Central Overland, California & Pike's Peak Express Company"—a long name quite in harmony with the long-distance business the company was preparing to transact. In this movement the members of the firm of Russell, Majors & Waddell were joined by Luther R. Smoot, Ben McCullough, J. B. Simpson, F. A. Bee, and W. W. Finney, who, also, had been and were variously interested in the transportation business on the great plains. The Leavenworth & Pike's Peak line was merged into the new corporation and its separate identity by name disappeared. Jones & Cartright did not participate in this new organization, but withdrew from stagecoaching and continued in their other business of freighting and merchandising. At one time in the early days they had $150,000 worth of merchandise in Denver.

Transportation of the bulk of the California mails had long been in the hands of the Pacific Mail Steamship Company. Its then current contract would expire June 30, 1861, and a new one would be made with whoever could carry the mails quickest, best and cheapest—the matter of time being of the greater importance. Wells, Fargo & Company, the Pacific coast express organization, united with the Southern Overland Company—the Butterfield line, in which the express company was interested—in an effort to deprive the steamship company of its contract—worth a million dollars a year—get it for themselves, and thus have a monopoly of California mails transportation. They made a competitive trial trip for speed with the steamship company, as the railroads do among themselves nowadays, and beat the ocean route in delivering eastern mail at San Francisco by about a day and a half. This put the prize practically within the grasp of the Southern Overland, and its managers considered that all they had to do was to await the time for the contract to be awarded.

Neither the steamship company nor the Southern Overland Company gave any consideration to the then embryotic central line. They either did not know of the plans of the new corporation or did not regard them as of any importance. At that particular time the line west by way of Fort Laramie was not very conspicuous in the western country and was not making a brilliant record. The occasional mails it carried were so long between times that the establishment having them in charge had been nick-named the "Ox-Mail Line." The Denver line was the pride of the company, but the other was soon to be brought to a standard of equal efficiency. So matters stood early in the spring of 1860, at the time when the men constituting the Central Overland, California & Pike's Peak Express Company had about completed their preparations for showing the country what they could do in the way of rapid transit across the continent. They also anticipated securing for their contemplated through line of coaches the contract, which would be awarded the next year, for transporting the California mails, and taking that business from the steamship company and the Southern Overland line.

One day late in March, 1860, the following advertisement appeared in the New York Herald and in the Washington Star, the last-named paper having been owned by Russell:

"I will start an express across the continent from St. Joseph, Mo., to Sacramento, Cal., April 3rd, 1860, the schedule time of which will be nine days. Letters weighing two ounces or less, five dollars. Other mail matter especially contracted for at the office, corner of Fulton Street and Broadway, New York City." W. H. Russell.

Simultaneously the following advertisement appeared in several western newspapers:

"To San Francisco in 8 days by the C. O. C. & P. P. Ex. Co. The first courier of the Pony Express will leave the Missouri River on Tuesday, April 3rd, at ——— p. m., and will run regularly weekly hereafter, carrying a letter mail only. The point on the Mo. River will be in telegraphic connection with the east and will be announced in due time."

"Telegraphic messages from all parts of the United States and Canada in connection with the point of departure will be received up to 5:00 p. m. of the day of leaving and transmitted over the Placerville & St. Jo to San Francisco and intermediate points by the connecting express in 8 days. The letter mail will be delivered in San Francisco in 10 days from the departure of the express. The express passes through Forts Kearney, Laramie, Bridger, Great Salt Lake City, Camp Floyd, The Washoe Silver Mines, Placerville and Sacramento, and letters for Oregon, Washington Territory, British Columbia, The Pacific Mexican ports, Russian possessions, Sandwich Islands, China, Japan, and India will be mailed in San Francisco."

"Special messengers, bearers of letters to connect with the express of the 3rd of April, will receive communications for the courier of that day at 481 10th St., Washington City, up to 2:45 p. m. of Friday, March 30th, and in New York at the office of J. B. Simpson, Room No. 8 Continental Bank Building, Nassau St., up to 6:50 p. m. of 31st March."

"Full particulars can be obtained on application at the above places and from the agents of the company."

These were the first public announcements of the famous Pony Express, which was one of the great enterprises for which the Central Overland, California & Pike's Peak Express Company was organized. They were received with much incredulity and astonishment, and with derision, also, by the great steamship corporation and by the managers of the Southern Overland. It was ridiculous and it could not be done; it was a scheme, or a trick, or a humbug, or all three rolled together, and so on. But it was done at the appointed time, and on time.

In the afternoon of April 3, 1860, a special train arrived at St. Joseph, Missouri, over the Hannibal & St. Joseph railroad, then the pioneer railway to the Missouri river, with letters and other messages for the first westward trip of the Pony Express. At four o'clock in the afternoon of that day Henry Wallace, the first west-bound rider, started on his pony from the Patee House in St. Joseph, crossed the river on a steam ferry-boat and put out on his journey. The Express arrived at Salt Lake at 6:25 p. m. on April 9th; at Carson City, Nevada, at 2:30 p. m. on April 12th; at Sacramento at 5:30 p. m. on April 13th; and at San Francisco by river steamer "Antelope" from Sacramento, at 1:00 a. m. April 14th. Its arrival at Sacramento and San Francisco was greeted by great throngs of people. The time was scheduled from St. Joseph at one hundred and twenty-four hours to Salt Lake, two hundred and eighteen to Carson City, two hundred and thirty-two to Sacramento, and two hundred and forty to San Francisco. The first trip was made on time, and as a rule all the trips were likewise made. The first east-bound Express left San Francisco at the same time on the same day, going by the steamer "Senator" to Sacramento, and through from there to St. Joseph on time. Denver was also included in the service by means of a branch route down from Julesburg.

A large amount of money was required to equip the line, which called for four hundred and twenty horses, tough, enduring beasts strong of wind and limb; for when they went they had to go at the top of their speed. As high as two hundred and fifty and three hundred dollars were paid for suitable horses bought west of the mountains. In addition to the regular stage stations and their keepers and assistants, one hundred new stations had to be established on the route, with a keeper and helper at each. Finally sixty riders, picked young men of courage and physical endurance, were employed as couriers. The stations of the established stage line between the river and Salt Lake, with some additions and changes, were well adapted to the needs of the Express; but west of Salt Lake many new stations had to be provided, as the Chorpenning stage line to the coast was poorly equipped with such necessaries. In several places the route west of Salt Lake was shortened.

The operation of the Express, and of the stage lines as well, was attended by a relatively heavy expense in the maintenance of the long chain of stations clear across the continent. While most of these establishments were neither elaborate nor extensive, their recurrence at intervals averaging about ten miles, called for large expenditures of money. In addition to this nearly all the feed for the stock, all the supplies and provisions for the riders and the many other employees, as well as for the stage passengers in transit, had to be transported in wagons the whole length of the line and distributed to the stations, together with all the equipment and material for making good the losses by accident and by wear and tear. The payroll was a fairly heavy one, the pony riders receiving from seventy-five to one hundred dollars a month and the stage drivers from sixty-five to seventy-five. The station agents and attendants were paid much less amounts, but all of them were fed and lodged by the company.

Before the Express started, the stations were from fifteen to twenty miles apart, as they had been established for the stage-coaches. The distances were reduced, in some places in the rougher parts of the route to less than ten miles, to enable the ponies to go at their best gait from one to the other without checking their speed. The ponies were changed at every station, but the riders continued over courses of about seventy-five miles. In emergencies the latter made double that distance without resting, either by covering two courses or doubling back upon their own. The usual gait at first was from seven to nine miles an hour. One rider made a record of three hundred and eighty-four miles, on one emergency occasion, without stopping except to change horses and to hurriedly eat his meals. The original through schedule was arranged on an average speed of eight miles an hour, requiring ten days to cover the entire route. In the summer of 1860 this was reduced to eight days, which called for a continuous speed of about ten miles an hour.

The Pony Express grew out of a necessity for quicker communications between the Pacific coast and the rest of the Union, and that need had existed and steadily grown stronger for several years before Denver was founded. When the unmistakable mutterings of our tremendous civil war were heard the need for some better methods became a National necessity. The established routes had been that of the Pacific Mail Steamship Company requiring twenty-two days from New York to San Francisco; the Southern Overland only a few days better and sometimes not so good; and the disjointed local lines running the best they could on the central route. California contained many Confederate sympathisers and it was not their fault that the State stayed in the Union. It would be hard to measure the value of the services rendered to the Nation by the Pony Express in those critical times, or to estimate the benefits which accrued by reason of the relatively quick communications it established with the Pacific coast.

Pony Express Station.

The men who organized and operated the Express did not expect that it would prove profitable, nor did they anticipate that it would prove so disastrously unprofitable as it turned out to be. They believed that its public utility and its practical possibilities once proved, would be followed by results that would be profitable, in that it would demonstrate the superiority of the central route as a mail highway, and be influential in obtaining the overland mail contract for their stage line connecting through to the coast. Something like it had been discussed by its owners for several years, and the enterprise in the form in which it had been finally inaugurated had been for a much longer period a favorite project of B. F. Ficklin, who became the Superintendent of the company which established it, and who for years had been connected with the plains freighting firm of Russell, Majors & Waddell.

The great achievement of the Express was its transmission of President Lincoln's inaugural address to Denver and across the continent in March, 1861. It was a document that was awaited with the most intense anxiety and interest at that time. The distance of nineteen hundred and fifty miles from St. Joseph to Sacramento was covered in seven days and seventeen hours, an average of upward of ten and one-half miles an hour continuously throughout the journey. The fastest time was made between Smith's Creek and Fort Churchill, a distance of one hundred and twenty miles which was covered by one rider in eight hours and ten minutes at an average gait of more than fourteen and one-half miles an hour. The message was brought to Denver from St. Joseph, six hundred and sixty-five miles by the route travelled, in two days and twenty-one hours—sixty-nine hours, and an average of a little over nine and one-half miles an hour. The pony making the run into Denver actually galloped over his ten miles and eighteen rods in thirty-one minutes; the fastest time any of them ever made. Special preparations were made for that transcontinental feat—which stands unparalleled—by shortening the runs for each horse and reducing the time for the riders to change from one to another to the least possible number of seconds.

The issue of the Century Magazine for October, 1898, contained a valuable and interesting illustrated contribution to western history from Mr. W. F. Bailey, of Denver, one of the executive officers of the Colorado Midland Railway. His subject was "The Pony Express," and we are indebted to his narrative for some of the details presented here, among which are the following:

"All the riders were young men selected for their nerve, light weight, and general fitness. No effort was made to uniform them, and they dressed as their individual fancy dictated, the usual costume being a buckskin hunting-shirt, cloth trousers tucked into a pair of high boots, and a jockey-cap or slouch-hat. All rode armed. At first a Spencer rifle was carried strapped across the back, in addition to a pair of army (Colt's) revolvers in their holsters. The rifle, however, was found useless, and was abandoned. The equipment of the horses was a light riding saddle and bridle, with the saddle-bags, or mochila, of heavy leather. These had holes cut in them so that they would fit over the horn and tree of the saddle. The mochilas had four pockets called cantinas, one in each corner, so as to have one in front and one behind each leg of the rider; in these the mail was placed. * * * The same mochila was transferred from pony to pony and from rider to rider until it was carried from one terminus to the other."

The riders were not often caught by hostile Indians. The couriers rode horses of great speed and endurance, and unless surrounded, could run away from menacing savages. The instructions were not to fight, but to run. Of this, Mr. Bailey says:

"There is only one case on record where a rider was caught, and that was owing to his having been surrounded. This occurred in Nebraska, along the Platte river. He was shot, and several days later his body was found. His pony, still bridled and saddled, was also found, with the mail intact. * * In laying out the route through the Indian country, pains were taken to avoid everything that would afford cover for an ambushed foe. One of the greatest dangers encountered by the pony-express riders was from immigrants and others who mistook them for Indians. In those days it was shoot first and investigate afterward, provided the shooter survived to make an investigation. A number of riders met their death in this way, being mistaken for Indians, horse-thieves, or road-agents. It is a strange but notable fact that the Indians often stood and saw the daring riders fly past, without offering to molest them. There was a mystery about it that made it 'bad medicine' to interfere with them. Superstitious as they were, they seldom bothered with anything that they could not understand."

Financially the Pony Express was an unfortunate enterprise. The government gave it no direct assistance in public compensation as a mail route. Under later arrangements, it carried a limited amount of government mail free and the only return it got for that was the government's sanction of its carriage of private mail. Of its financial operations Mr. Bailey, in his account heretofore mentioned, says:

"The expenses of the line for the sixteen months during which it was operated * * * * was approximately:

Equipping the line	$100,000
Maintenance, $30,000 per month	480,000
Nevada Indian War	75,000
Miscellaneous	45,000
	$700,000

While it is true that the receipts did reach as high as $1,000 per trip, in all they did not exceed $500,000, leaving a net loss of $200,000."

The same writer adds the following details:

"It eventually required when the service got into perfect working order, 190 stations, 200 station-keepers and the same number of assistant station-keepers, 80 riders, and from 400 to 500 horses to cover the 1950 miles from St. Joseph to Sacramento. * * Located about every 200 miles were division agents to provide for emergencies, such as Indian raids, the stampeding of stock, etc., as well as to exercise general supervision over the service. One, and probably the most notorious, of them was Jack Slade, of unenviable reputation. For a long time he was located as division agent at the crossing of the Platte, near Fort Kearney."

The Pony Express delivered in San Francisco news and messages from the eastern States "only nine days old," an achievement that occasioned more wondering comment then than is now bestowed on the everyday fact that knowledge of events occurring near noon at Washington or New York is in San Francisco at nine o'clock a. m. of the same day. Twelve pounds of mail was about the usual amount carried by the Pony Express each trip, though upon occasion as much as twenty pounds was taken. In the beginning the charge for letters weighing up to a half-ounce was five dollars, but later that rate was cut down one-half. Some newspapers, as evidence of their enterprise, printed copies of their papers on tissue paper for transmission by the Pony Express. The mail was all wrapped in oiled silk to protect it from dampness, before being locked in the pockets of the mochila. The Express started with a weekly service, but in June, 1860, it was made twice a week. The rider kept his horse on the full run, and as he approached a station he disengaged the mail saddle-bags in readiness to changing to a fresh steed, which was done in a few seconds. At the end of this run, whatever the hour of day or night, another ready and waiting messenger snatched the mail, struck spurs to his horse and was off like the wind.

The Pony Express was regarded all over the country as a most remarkable enterprise, and its achievements excited wondering enthusiasm everywhere. From the standpoint and under the circumstances of those times it was a notable undertaking. Though the stage lines were making their regular trips over the same route, the Pony Express messenger was to them what a flying mail train is to an accommodation train on the railroads now. The coaches had shown that a railroad could follow their route, and the new express, which was held to be annihilating time and space, demonstrated the great popular utility and importance of quick communications between the eastern and western confines of the country. It was the final confirmation of the necessity and practicability of a trans-continental railroad. The old St. Joseph Gazette thus discoursed and rhapsodized upon the feats of the ponies and their riders:

"Take down your map and trace his foot-prints from St. Joseph on the Missouri, to San Francisco on the Golden Horn—from the last locomotive to the first steamship—more than half across our boundless continent. Through Kansas, through Nebraska, by Fort Kearney, along the Platte, by Fort Laramie, past the Buttes, over the Rocky Mountains, through the canyons, along the steep defiles—Utah, Fort Bridger, Salt Lake City—he witches Brigham with his swift ponyship. Through valleys, along grassy slopes, into the snow, into the sand, faster than Thor's Thialfi; away they go! rider and horse, did you see them! They are in California, leaping over its golden hills, treading its busy streets. The courser has unrolled the great American panorama, and allowed us to glance at the future home of a hundred millions of people. He has put a girdle round the earth in forty minutes. Verily, his riding is like the riding of the son of Nimshi, for he rideth furiously. Take out your watch. We are eight days from New York, eighteen days from London. The race is to the swift."

But the Pony Express did not long survive. Under an act of Congress providing for the construction of an overland telegraph line from Omaha to San Francisco, the wires reached Fort Kearney in April, 1861, and construction was pushed so rapidly that through connection was made in the following October. The Pony Express was continued over the fast diminishing gap between the advancing ends of the telegraph until the completion of the line ended its career on October 22, 1861.

The ominous political events of the winter of 1860-61 had alarmed the Southern Overland Stage Company and caused it to begin preparations for transferring its operations to a route north of the secession zone. In February, 1861, the Postmaster General was directed by Congressional enactment to contract for the transmission of through overland mails to California by the central route—that of the River Platte. The eight days' transit of Pony Express mail from the Missouri river to Sacramento had demonstrated that the central was by far the shorter and quicker route across the continent, and the outbreak of civil war was almost at hand. In the meantime the Southern Overland Company and the Central Overland, California & Pike's Peak Express Company had abandoned their previous attitude of rivalry for the overland mail contract, effected an union of interests and arranged for a consolidation of properties under the corporate name "Overland Mail Company," of which William B. Dinsmore of the Southern company, had been elected President.

Early in March, 1861, Congress had supplemented its action of the previous month by directing immediate discontinuance of mails over the southern route, and that the company having the contract therefor should arrange for carrying its mails, with large additions thereto, over the central route until the expiration of its contract term, June 30, 1861; the compensation therefor to be at the rate of $1,000,000 per annum. On March 12, 1861 in compliance with the action of Congress in the previous February. The Post Office Department contracted with the new Overland Mail Company for the transmission of mails each way every week day from St. Louis, Missouri, to Placerville, California, for $1,000,000 per annum; the contract to take effect July 1, 1861, and to continue three years. The Second Assistant Postmaster General supplied us with the following memoranda concerning this contract:

> "Under order of March 12, 1861, Route Number 10,773, St. Louis, Mo., to Placerville, Cal., six times a week and back, was established from July 1, 1861, to June 30, 1864, and service awarded to the Overland Mail Company, W. B. Dinsmore, President, and E. G. Alvord, Superintendent, at the rate of $1,000,000 per annum."

As already stated, conditions in the southern part of the country interrupted the operations of the Southern Overland Company in the spring of 1861, and its transmission of mails had ceased in March. The new Overland Mail Company then took over the former company's mail contract for the unexpired months of its term—to June 30, 1861—and the transmission of overland mails continued almost without any interruption in consequence of the change of route. Later in that spring the new Overland Mail Company added to its equipment what had been left of the Southern company's property after the Confederates had confiscated what they considered their share of the outfit.

It was in consequence of these proceedings that the Central Overland, California & Pike's Peak Express Company, as such, passed out of existence; but it was more a change of name than anything else, as its successor, the Overland Mail Company, was controlled and principally owned by the men who had established and owned the C. O., C. & P. P., the old Southern company's interests having been those of a minority. The C. O., C. & P. P. Company had, before this consolidation, become somewhat embarrassed financially by losses in operating the Pony Express. The new company assumed these obligations, and before long had many others added to them, the load within a short time causing its bankruptcy.

The new overland mail contract taking effect July 1, 1861, required that mails should be taken from each terminus every week-day and carried through in twenty days; enough second-class matter to be added to the letter mail to make an aggregate of 1,000 pounds transported each way daily. Provision was also made for utilizing the Pony Express to carry up to five pounds of government matter, and private mail at one dollar for each half-ounce or less. The contract also provided for daily (except Sunday) mails each way between Denver and the Missouri river, and for a tri-weekly service each way between Denver and Salt Lake City.

On July 1, 1861, the first of the great through mails to California under this contract, was started and went through within the specified time, having been transmitted to St. Joseph from St. Louis by way of the Mississippi river and the Hannibal & St. Joseph railroad. So, the old Hockaday "ox-mail line" had finally become part of the great overland line for mails and passengers. The Overland Mail Company's line, as such, still terminated at Salt Lake City; a connection being made there with the old Chorpenning line thence to Placerville. So, there was not, strictly speaking, a through stage-line under one ownership and management, though practically it was such. In preparation for expediting the mails under the new contract, the route of the Chorpenning stages had been changed to pass around the south end of Salt Lake and thence due west to Virginia City, Nevada.

As already mentioned, the Pony Express was continued in operation between the advancing ends of the telegraph wires until their union at Salt Lake City in October, 1861, finally threw it out of existence. Losses entailed by the Pony Express, and reduced income from passenger travel in consequence of war-time conditions, brought the affairs of the proprietary stage company into bad shape in the autumn of 1861. They quickly went from bad to worse when the distressed government failed to promptly pay the large sums due for the first quarter's transportation of the California mails under the new contract, reaching a crisis at the close of that year and forcing the Overland Mail Company into bankruptcy.

Ben. Holladay, deceased.
(Photographed about 1870.)

Early in 1862 all the property and business of the bankrupt company passed to Benjamin Holladay at an enormous sacrifice to the former owners. The entire property had been appraised by agreement between sellers and buyers, and Holladay took it at the valuation of $700,000, though that sum represented but a part of the company's indebtedness. Mr. David Street, now a citizen of Denver, and to whom we are indebted for many of these details relative to the old local stage lines, was one of the appraisers. He had been Paymaster of the C. O., C. & P. P. Company, and had also been associated with Russell, Majors & Waddell in many of their other enterprises. Notwithstanding their large interests in stage-coach lines, that firm had continued their plains-freighting business, and in it, also, had met heavy losses.

Holladay, before he purchased the stage company's property, had been engaged in many large undertakings in the west and on the Pacific coast. He had at times been associated with William H. Russell in various western enterprises and had accumulated a fortune—to a large extent through Russell's ability to conceive great undertakings and his own to carry them successfully forward. He had advanced large sums of money to the C. O., C. & P. P. and its successor company, and to the men who had established them, with the result that he became their heaviest creditor.

William H. Russell, projector of the Leavenworth & Pike's Peak Express Company, of the Pony Express, of the Central Overland line, and interested in scores of other western enterprises, was a man of remarkable energy, but of somewhat visionary temperament. He always had more business on his hands than he could properly attend to, and while he was making money in one direction he was losing it in another. He personally became a large shareholder in the Denver Town Company, and later was extensively engaged in mining in the Clear Creek Districts, his interests being looked after by agents and employees. He died September 20, 1872 at the home of his son, John W. Russell, a banker at Palmyra, Missouri.

Alexander Majors, the second member of that famous plains transportation firm, outlived his two associates by a number of years. He died in Chicago in January, 1900, aged eighty-six. For about seven years immediately prior to his death he had resided in Denver, and his erect, commanding figure was a familiar one on our streets during his sojourn here. William B. Waddell never became personally identified with Denver or this part of the country to the extent that Russell and Majors did, and was not generally known here. He died in Missouri some twenty or twenty-five years ago.

After Holladay purchased the Overland Mail Company's property he obtained from the Colorado Territorial Legislature a most liberal charter for the "Holladay Overland Mail & Express Company," of which he was the principal owner. General Bela M. Hughes, then of St. Joseph, but now and for many years past an honored citizen of Denver, was largely interested in it, and became and for several years remained its President. Atchison, Kansas was made the eastern terminus of the line, and Holladay soon became nationally known through his able management which practically dominated through to the coast as well as over the Denver division. In November, 1866, he sold the entire establishment to Wells, Fargo & Company for a consideration of $1,500,000 in money and $300,000 in that company's stock. Soon afterward there was a supplemental story afloat that Holladay had agreed to hold the stock as an investment, but instead of doing so, prudently converted it into cash for investment in another direction.

Holladay's Overland Mail Stage line, including the division from Julesburg to Denver, was probably the best equipped and most efficiently managed ever operated in this or any other country. It passed under a discipline as prompt and methodical as the present management of a successful railroad. To the surprise of all eastern people, who still believed the Rocky Mountain to be the "impassable barrier," mails and passengers were transported across the great plains, through the mountain recesses and on to California a week sooner than by the ocean route by way of the isthmus, and several days quicker than the best that had ever been done by way of the southern overland route. The service in and out of Denver was exceptionally good and its traffic the most profitable of any part of the system. Over the long routes the coaches moved with almost the regularity of railway trains.

The regular and systematic operations of these central stage lines over the plains and mountains removed the last doubt of the feasibility and necessity of a central railroad across the continent, and their successful performances were among the immediate causes that led to the construction of such a road. In the midst of the civil war the work was authorized by Congress and preparations were made for beginning construction at each end of the great iron highway.

In the summer of 1862 Holladay changed the route of the overland line west from Julesburg, abandoning that part of it by way of Fort Laramie, and following up the South Platte to the mouth of the Cache-a-la-Poudre, going thence north westward across the mountains by way of Virginia Dale. This new route having brought the main line within about fifty miles of Denver, a local demand arose for a further change that would place the city directly on it. This was done early in 1863, the through stages coming from Julesburg and going hence northwest by way of Virginia Dale.

The C. O., C. & P. P. stage company was not, as we have seen, without opposition on the route between Denver and the Missouri river; nor did its successor organization escape the same competition. The Western Stage Company, which we have already mentioned as having made its appearance in Denver early in the autumn of 1860, was an ancient establishment. It had its beginning as a corporation in Ohio, early in the century now just closed. It operated many lines of stages in that State, and was successively driven by the advancing railroads into Indiana, Illinois, Iowa and Nebraska. At the time it extended its Fort Kearney line to Denver its coaches were traversing the larger part of Iowa. Its career as a competing through line to Denver was, as we have seen, a brief one; but it was long enough and troublesome enough to impose on the rival company the necessity of getting rid of its competition. This transaction was one of several immediate causes that brought bankruptcy upon that company. The Western then established several local lines out of Denver; to the Clear creek towns, to Boulder, a second one into the South Park, and to other mining points, and remained in the business in Colorado until the railroad era.

Holladay stage-coach office, southwest corner Fifteenth and Market streets.

In the autumn of 1865 a stage line in competition with the Holladay establishment was inaugurated by D. A. Butterfield & Company between Atchison, Kansas, and Denver, by way of the old Smoky Hill route; the first coach arriving here on September 23rd. The new line was well equipped, made a little better time than the other and soon had a good share of the patronage. D. A. Butterfield came with his first coach and was banquetted at the old Planter's House. Butterfield afterward contemplated extending his line to Salt Lake, and in January, 1866, the Colorado Territorial Legislature incorporated for him the "Butterfield Overland Dispatch Company," of which E. P. Bray, William R. Brewster, Charles A. Cook, George E. Cook, William H. Fogg, William H. Gale, George A. Hinsdale, W. A. H. Loveland, and J. H. Messinger were chosen Directors. These elected William R. Brewster, President; W. A. H. Loveland, Vice President; George E. Cook, Treasurer; and Frank Hall, Secretary. It was the purpose of the company to open a stage route across the mountains by way of Berthoud Pass and to construct a telegraph line from the Kansas border through to Denver and on to Central City. Their telegraph line was never built nor were their stage operations extended across the mountains. Later in 1866 this line was bought by Ben Holladay a short time before he sold all his stage properties to Wells, Fargo & Company.

At the period of its greatest extent the Holladay system embraced the main line from Atchison by way of Kearney to Salt Lake, with a division to Denver; the D. A. Butterfield line from Atchison by way of Topeka and the Smoky Hill to Denver, with a branch to Central City; a line from Omaha to Kearney; one from Nebraska City to Kearney; one from Salt Lake City to Helena, Montana; and one from Salt Lake City by way of Fort Hall, to Dalles, Oregon; in all about 3,600 miles of routes over which one or more stages passed each way daily.

The completion of the Union Pacific and Central Pacific railroads in May, 1869, terminated the career of the Overland Stage Line. The Wells-Fargo company had earlier begun disposing of its various branch lines including the one from Cheyenne to Denver, and sold the latter together with their line from Denver to Central City, to John Hughes & Company, of Denver. These purchasers later sold the two lines to Robert J. Spotswood, William F. McClelland and their associates, who were then also operating a South Park stage line, and who continued running the stages between Denver and Cheyenne until the completion of the Denver Pacific railroad. This left the Denver and Pueblo stage-line the only important prairie line of stages out of Denver, and it was soon thereafter driven into retirement by the remorseless locomotive.

As the Union Pacific and Central Pacific railroads had advanced, the stage-coach business had become unprofitable to Wells, Fargo & Company and had brought them to financial grief which resulted in a reorganization under the slight change of name borne by the present successor company. The Wells-Fargo Express Company is, we believe, operating under the charter granted Ben Holladay by the Colorado Territorial Legislature.

Immediately after the discovery of gold in the Clear creek districts a relatively large tide of travel set in between the Cherry creek towns and the mining camps. The freight business in that summer was not so heavy as might have been expected to arise from the needs of the large numbers of people over there. The principal reason for this was that most of them had brought enough supplies with them to last through the season. It was well that they did so, for the lack of roads in the districts made it a hard job to get much dead weight into the camps that summer.

In July of that year D. B. Castro, in company with a man named Shephard, established an express line between the Cherry creek towns and Gregory Gulch, carrying passengers and light freight up the almost impassable mountain way. This was the first regular public transportation line between Denver and the mining camps. In some places the trails were as steep as a stairway and not much better than mere unimproved goat-paths. Toward autumn they were improved somewhat, but they were still hard roads to travel. Most people went on horses or mules and had experiences they remembered as long as they lived.

Denver and South Park stage-coach.

Through the following winter some successful attempts at road-making and bridging were completed, as the need for better regular public facilities for traveling had become a necessity. On March 4, 1860, Kehler & Montgomery started a daily express stage between Denver and the mining districts in the mountains, which was the first of the local lines that was efficiently equipped for its business. As the season advanced and the people were coming in in greater numbers, the fast increasing business demanded still further facilities, and Sowers & Company put on another line. These lines were soon unable to accommodate the travel, and by midsummer several others entered the field, but were later supplanted by those of the Western Stage Company. In that year a line was established by the Denver & South Park Stage Company between Denver and Fairplay, Buckskin Joe, and Breckenridge, and to California Gulch (site of the present Leadville); and another, by A. Jacobs and his associates, south by way of Pueblo to a connection with stages on the old Santa Fe trail to Santa Fe. In the summer of that year Hinckley's Express began operating between Denver and Central City and other mining towns and camps, with later connections to the Missouri river by the Western Stage Company while that line was running. Among so many rival transportation lines competition became very keen, and to some of them, very disastrous.

Throughout that decade—1860-70—Denver was thoroughly a stage-coach town. As we have stated, the California Overland Mail coaches were routed through the city, and after the Union Pacific road was opened to North Platte the travel to and from Denver became so heavy that three, and often four, coaches were required each way daily to accommodate the local business. When that road reached Cheyenne a half-dozen coaches each way daily were often required. We associate the term "stage-coach town" with lethargy and sleepiness, but conditions here in that decade were far the other way. The coaches of the various local and through lines in company with all the other business by teaming made busy places of the highways in and out of Denver, and crowded the streets of the young city with a noisy congestion of traffic, a large part of the uproar coming from drivers bawling at their ox-teams or swearing at their mules as they made their way along the ofttimes wretchedly bad streets of those days.

CHAPTER XXXVII.

DEPRESSING INFLUENCES—EFFECT OF IMPENDING WAR—PROPERTY VALUES—PIONEER PUGILISTS—POPULATION OF CITY AND TERRITORY IN 1861—TELEGRAPH LINES AND RATES—PEST OF GAMBLERS—DEPRESSED CONDITIONS—DENVER'S APPEARANCE—GREAT FIRE—CITY'S EXTENT—CHERRY CREEK FLOOD—HENRY C. BROWN'S LAND ENTRY—REYNOLDS GANG OF OUTLAWS—DENVER'S DREARY ASPECTS—WINDSTORM OF CHRISTMAS, 1864—RAILROAD ANTICIPATIONS.

The history of Denver is not an account of regular, uniform advancement from one stage of development to a greater and better as the years went along. The city has had the extremes of ups and downs, and its experience suggests that of some of its builders on whom fortune alternately smiled and frowned. Perhaps its career is in some degree a reflex of certain characteristics of the great and fascinating industry which brought it into existence. There have been the flowing and ebbing of prosperity's tide; the rising to lofty heights, the sinking to depths that revealed low beaches strewn with the broken hopes of many men; like the tides of the ocean that encounter configurations of coasts which cause the imprisoned waters to lave the lofty slopes and then rush out again leaving the bed-rock bare.

With the beginning that had been made in 1859 and 1860, and with the apparent bright prospects for the future, a sudden interruption of development and growth was hardly to be expected. But it came, nevertheless. Late in the autumn of 1860 there was a consciousness of reverses to come, and with it a feeling of depression. This situation resulted partly from the then impending civil war; partly from the grievous disappointment of thousands who had come into the country anticipating the acquisition of sudden riches; and partly by the increasing difficulties of treating the ore from mines otherwise capable of yielding great values. The imminence of war had induced many to go back to their former homes; the disillusioned went back in droves, war or no war; and the prospects for those who remained began to lose their more alluring aspects.

The departing hosts, only a small percentage of which had come here with the intention of permanently remaining, had proclaimed their loss of confidence in the country and in the prospects for Denver ever becoming a town of much consequence. When the year closed about half of the town's previous maximum population had disappeared over the plains and in other homeward directions.

The creation of Colorado Territory by Congress early in 1861 had a beneficial effect, in that it gave the country for the first time a government of unquestionable authority; but it also inaugurated the long era of political feuds and turmoil. Though some material progress was made that year and the next, it was not great. The outbreak of the civil war added grave dangers to the situation here, with the result that the strifes of war and politics engaged the attention of the people for a couple of years to the subordination of nearly everything else; and war mixed with the old-time Territorial politics made a combination not well calculated to promote the development of a new country's resources or the growth of a far isolated frontier city.

In 1861 town lots had become cheap, even in what were considered the "built-up" sections of the young city; and absurdly cheaper on the outside. The lots on the east side were twenty-five feet front by one hundred and twenty-five deep, and some of those in the neighborhood of the present Equitable Building changed hands in those times at prices ranging from a dollar or two to ten dollars; the latter being for corner lots, and which was considered by some critics in that period to be an extravagant price. In a few exceptional instances lots but little farther away were sold by indifferent owners for less than a dollar. In other outlying sections lot values were no greater. On the other side of the Platte they were even less. There was a great abundance of land around the town, and but few of the people then here cared to invest at any price in small patches of it which were still overgrown with wild herbage and in the possession of prairie dogs.

While town lots were cheap enough at this time, they had been far cheaper early in the spring of 1859 before the mountain discoveries of gold were made. The apparent hopelessness of the situation at that period in the city's career was emphasized by the "values" of "real estate" in the Cherry creek towns. General Frank Hall in his "History of Colorado," (1888) relates the following:

"Mr. A. C. Wright informs me that in March, 1859, he was the owner of 124 lots in Auraria, 80 in Denver, and 136 in Highlands; also the ranch subsequently known as McNassar's, near the present Argo, which he "took up" in September, 1858. Desiring to visit Salt Lake, but having no animal for the journey, he offered all this property without reserve to a Mexican named Joe Merrival for a horse, saddle and bridle, but it was rejected with scorn. Joe felt that his horse and equipments were worth something, while the land was valueless. It is now worth millions. Mr. Wright finally sold the ranch to a Frenchman for a horse and $25 in cash."

On April 6, 1861, the so-called "sport-loving" part of Denver's population was treated to the first prize-fight fought in Denver or anywhere near it. Bruiser "Con." Orem and a nameless antagonist known only as "Texas," battled for a purse of fifty dollars. "Texas" failed to revive on time after the second round and Orem took the money. On August 24th, of the same year, "champion" Orem and a new victim named Davis fought for five hundred dollars a side in a large corral about two miles north of the city, in the presence of some two thousand spectators. The two creatures fought one hundred and nine rounds in one hour and forty minutes, and both were badly wrecked, but Orem was again the victor. On April 16, 1863, a locally famous combat between bruisers William M. McDonough and James Raffle, occurred in a huge pavilion near Parkinson's ranche about one and one-half miles northeast of the city. They battled before a large crowd for a prize of five hundred dollars, through eleven rounds and for about a half hour, when Raffle hauled down his flag. Annals of many later achievements in this line might be added, but it would hardly be worth while.

The town of Golden in 1861 was an active and ambitious rival of Denver, and did not hesitate about declaring its superiority as a metropolis, in consequence of its proximity to the Clear creek minings districts. In population it was nearly as large as Denver, but it was not anywhere near being the metropolis of the region. Denver's possession of that distinction was not at any time seriously menaced. Later, when the Territorial Legislature met there and made it for the time being the capital of the Territory, Golden had many golden visions in its dreams.

Nevertheless the population of the metropolis was habitually and persistently over-estimated through 1860 and into 1861. A special election was held on January 28th, 1861, at which twelve hundred and ninety-one votes were cast. This was the largest vote that had been cast up to that time, yet it was a disappointment to the partisans of the united Cherry creek towns, who made no proper account of the large number of people who had left the country the previous autumn. Of the total, the old Denver City precinct cast seven hundred and forty-four votes; Auraria, five hundred and sixteen; and Highland forty-two. These figures show how far the Denver side of the creek had outgrown the Auraria side, and they also demonstrated how little headway the growth of Highland had made up to that time. It was still a mere hamlet and remained so for several years longer.

The extent to which the population of the country had been depleted was further revealed in the summer of 1861. Estimates of the inflow of people in 1859 had made the aggregate number entering what is now within the domain of Colorado as high as one hundred and fifty thousand. It was known that most of this vast army of fortune-seekers had gone whence they came, before that year closed. In 1860 a number almost, if not quite, as great, was believed to have come into the country on the same mission that had beguiled their predecessors. It was known, also, that most of these had gone away again. Still, it was believed that a large number out of the influx the two years had brought, had found lodgment in the vast region it had overflowed.

The first important act of the regularly established Territorial government was to have a census made of the inhabitants, which was done soon after Governor Gilpin entered upon his duties. The result of this was that the Territory was shown to have had in that summer a population, other than Indians, of only twenty-five thousand, three hundred and thirty-one, according to the census returns which, it was assumed, presented none of the fantastic statistics that had arisen from the "Jefferson Territory" elections. Of that total, twenty thousand, seven hundred and ninety-eight were white males; four thousand, four hundred and eighty-four white females; and eighty-nine negroes.

The people of Denver in these times thought they were having an interminable delay in securing telegraphic communication with the outside world, though it was only relatively a long wait; for, within five years after the town had been founded it was in direct telegraphic connection with the entire inhabited part of the country outside of the Southern Confederacy. The Pacific Overland Telegraph Company had been organized in 1860 to build a line from Omaha to San Francisco as quickly as possible, because of the then threatened civil war. Construction began in the winter of 1860-61, and as the line advanced messages for Denver were forwarded from its end by Pony Express. It was completed through to the coast on October 22, 1861, but Denver was left without a branch line; messages being carried between this city and Julesburg, the nearest telegraph station, by stage coaches or special messenger.

Denver remained without a wire for two years longer. As we later enter into some details of pioneer telegraph construction into the city, we will not consider them here. In the summer of 1863 the construction of a branch line from Julesburg to Denver was begun, and completed about the first of October, affording intense relief from the feeling of isolation that had been one of the trying hard-ships from the days of the city's settlement. The expense of building the line was almost wholly defrayed by subscriptions from Denver citizens. The rates for messages were necessarily very high, in the beginning. Ten words to New York cost nine dollars and ten cents; to Boston nine dollars and twenty-five cents; to St. Louis seven dollars and fifty cents; and proportionately to other places. The cost of constructing the pioneer overland line was excessive; everything had to be hauled out by teams from the Missouri river; and in the building of the line to Denver the conditions were but little more favorable.

View on Larimer street, looking westward, the day after the flood of 1864. This picture suggests the character and extent of "West Denver" at that time.

The work of Vigilance Committees had not dismayed the men who made a livelihood out of gambling, for it had not extended to them as a class. Some of the executed desperadoes had been gamblers, but not all of the gamblers had been murderers; therefore, it was as murderers and not as gamblers that some of the fraternity had suffered. Though the population of the town and region had declined in 1862, the mixed character of what was left still afforded profitable pickings for these gentry, who had become politically influential. In the spring of that year they secured the passage of an ordinance by the City Council that, while pretending to restrict and regulate the vicious business, actually legalized some of the worst practices. One of the Council members, the late George W. Clayton, a pioneer citizen, felt so indignant at the passage of the ordinance that he immediately resigned from the body guilty of the shameful act.

The general situation from a material point of view improved but little through 1862, though some building was done and a considerable number of new enterprises were undertaken, as we will have elsewhere narrated. Denver was by no means a dull town in appearance. The exigencies of war and politics would have kept it animated had there been nothing else going on. But its position as the metropolis of a large region caused its streets to be thronged, though three-fourths of the people might be denouncing their "hard luck" or bitterly complaining of "hard times." It has been characteristic of the city that in every period of depression its general appearance gave the uninformed stranger but little hint of adverse circumstances.

Of the conditions and prospects toward the close of 1862, Wooton, who left here at that time, says in his narrative:

"When I left the place at the end of a four-years' stay, with about twenty times the population it had when I went there, the chances seemed to me to be that it would get smaller rather than larger. The population had fluctuated continually during the four years I remained there, first going up and then down, until I made up mind that it was a good place to get away from. That's where I lacked what you call foresight; but such things all go in a lifetime, and as I have already said, I suppose I am just as well off where I am."

At this period in Denver's career the town in itself and by itself was not a pretty place. Its natural surroundings were magnificent, but no amount of local pride and patriotism, no stretch of partisan and partial enthusiasm, could make the town appear a thing of beauty. Its treeless, grassless, bushless condition gave it an exceedingly uninviting appearance; its motley, irregular, ugly structures of brick, frame, or log were calculated to cause nightmare in the brain of an unseasoned visitor. It is probable that nowhere else in the world were ever seen such architectural horrors, and combinations of architectural freaks and wretchedness, as those presented in the American frontier towns of a generation ago. It would seem that human ingenuity would be incapable of producing results so uniformly frightful—that the law of chance, if it may so be called, ought to and would have brought in an occasional something to vary the dreary monotony and relieve the ferocity of ugliness. But it never did so.

Denver in this stage of her development had her full share of this sort of thing. To be frank about it, she did not have much of anything that was not of that sort; and the consequences of unwatered streets and door-yards added greatly to the general dreariness and forlornness of aspect presented by the noisy, uncouth town. We do not realize how much of the present beauty of the city and of our pleasure in seeing and enjoying it, are due to the combined efforts of the architects, the water company and the humble but potent sprinkling hose.

In Denver in the early "Sixties" a large majority of the buildings were but one-story high—or, to make the best of them, one and one-half stories. The rest were of two stories—none more than that. The higher ones were worse than the lower, in that their loftiness made their frightful ugliness more conspicuous. The accompanying illustrations give the reader an accurate record of the architectural conditions of these times. Should the reader prefer to otherwise verify this narrative, that can be done to a limited extent by visiting the old Auraria quarter which is reached by turning to the right at the first corner after crossing the Larimer or Market street bridges over Cherry creek, or to the left after crossing either of the fine new ones connecting Wazee and Blake streets with the Fourteenth street viaduct across the Platte. In that general locality will be seen some of the buildings of the period we are now considering, which are unchanged, save for the wear and tear of nearly forty years' exposure to the elements, and to the greater wear and tear occasioned by the thousands of their restless, worthy, hopeful, despairing, reckless, or worthless human occupants through past years. On the eastward or "East Denver" side of Cherry creek, and near to it, the stroller along Wazee, Blake and Market streets, outside the old burnt district, and on Fifteenth, too, may see a small number of business buildings that date from this era, and occasionally one that has survived from 1859. In this old section the earlier structures are of a better character than those on the Auraria side. They are easily recognized, as their appearance proclaims the period of their origin.

In the "old" times which we have taken the liberty to call the "early Sixties," these and many other blocks of buildings were fronted sometimes by "sidewalks" of uneven boards that would spring up and down in the most unexpected way, and sometimes by intervening gaps where the foot would take to the native earth. If the wayfarer had been inconsiderate for himself in his encounters with the blandishments held forth by the divers resorts that frequented his path—and there were many such wayfarers—he felt grateful when he left the tripping planks and got upon a stretch of solid earth again.

Up to midsummer of 1862 the town had no organized method of extinguishing fires, and everything had been left to the chances of circumstances. On July 15th, of that year, the City Council by resolution provided for the organization of a hook and ladder company and two bucket companies. This was a beginning, but in the great emergency of the next year the original Denver fire department realized and demonstrated its impotency, for it existed chiefly on paper.

The spring of 1863 was a dry one in this region and high winds were almost daily visitors. On the 19th of April, under such favoring conditions, a fire which became known in the city's annals as "the Great Fire," broke out. It started between two and three o'clock in the morning in the rear of the Cherokee House which stood on the southwest corner of Blake and Fifteenth streets, on which, after the fire, J. H. Fillmore built the building now standing there. A strong but fitful wind was blowing and in two or three hours the heart of the city was a blackened waste, the flames having leaped the streets as they consumed the dry wooden structures that were rich in rosin and burned like tinder. The course of the fire was in all directions from the starting point, and to arrest its progress many small buildings were torn away, but to little purpose. The entire population was alarmed and every able-bodied man was employed in fighting the fire and in endeavoring to save the contents of the buildings.

The burnt-over district was principally within the area bounded by Sixteenth, Market and Wazee streets and Cherry Creek, though in several places the flames spread beyond those boundaries. Auraria was unharmed, yet at one time it seemed that the whole of both towns was doomed. The only buildings within the area mentioned, that escaped destruction were those of Laflin, Smith & Company, Jones & Cartwright, Ford & McClintock, A. E. & C. H. Tilton, P. S. Pfouts, and part of H. J. Brendlinger's. Fear of the fire reaching the large quantity of powder stored in Laflin, Smith & Company's magazine building had caused the greatest apprehension, and the inability of the "fire department" to cope with the spreading flames had intensified the terrors of the situation. So great was the destruction of provisions that prices almost doubled within a few days.

The total loss was estimated to have been three hundred and fifty thousand dollars, against which there was comparatively little insurance, as rates were excessively high. Many men were ruined by that fire. A list made soon afterward, of those who suffered by it, was as follows, the losses ranging from two hundred to twenty thousand dollars:

Arbour, Clark & Fitchie,
Baldwin, Pegram & Co.,
Belden & Co.,
Brannan & Mittnacht,
Brendlinger, H. J.,
Broadwell & Cook,
Campbell & Jones,
Cherokee House,
Cheesman, W. S.,
City Bakery,
Cole, —,
Cook, C. A., & Co.,
Cook, J. A.,
Crawford, —,
Daniels & Brown,
Dixon & Durant,
Dougherty, D.,
Douglass, J.,
Elephant Corrall,
Fillmore, J. S.,
Fink, J. P.,
Ford, B. L.,
Frederickerson & Jackson,
Gottlieb, J.,
Gurnhart, J. H.,
Heatley & Chase,
Hiney, H.,
Hodges, J. H.,
Honore, B. L.,
Jacobs, A.
Kiskadden J.,
Lancaster & Co.,
Lavin, T. W.,
Madison, —,
Mason, B. F.,
McGee & Co.,
Merfield, M.,
Mickley, H. J.,
Moore, —,
Newman, A.,
Nye & Co.,
Palmer, T.,
Pickett & Lincoln,
Poznanski, H., & Co.
Pyles, —,
Rice, S. O.,
Richau, J.,
Riethmann, J. J.,
Roath, W. T.,
Rohlfing & Co.,
Ruffner, J.,
Sanders, —,
Sherwood & Brother,
Smith, —,
Stebbins & Porter,
Towne, A. D.,
Tritch, George,
Ullman, D.,
Voorhees & Hawkins,
Walker, M.,
Whitsitt, R. E.,
Wilhelm, D. O.,
Wilson, —,
Wood, B.

A majority of these men resumed business and nearly all of them who owned the property they had occupied, rebuilt, the work of reconstruction having been started all over the burnt district immediately. The new structures were of brick and gave the town a far more presentable aspect than it had before "the Great Fire." Most of those now standing in that district date from that fire.

Devastating fires would appear to be misfortunes common to Colorado cities, and to mark the line between the first and second eras of their architectural progress. In May, 1874, Central City was almost entirely burned away; in April, 1896, Cripple Creek had a similar experience; and in August, 1899, Victor had a like visitation. While in each instance the flames brought ruinous losses to individuals, they were followed by vastly improved appearances and conditions.

In these times the young city had not extended much beyond the area bounded by the line of Curtis street, Twentieth street and the Platte river, on the eastward side of Cherry creek. On the west side about two-thirds of the area between Curtis street and the Platte were occupied by buildings, but a majority of them were not very imposing structures. The "West Denver," or old Auraria portion of the city territory still contained the larger part of the business and population, though it was not holding its own against the eastern side; and in 1863 its prestige was fast waning.

Larimer street on both sides of the creek was a business thoroughfare, with the larger share of its business importance in the west side; it having been on the east more generally given over to dwellings. Blake was the principal business street on the east side, and the same so far as it extended beyond the creek; with McGaa, (now Market), the present Fifteenth, Larimer, and Wazee streets next in rank about in the order in which they are named. In a general way the business section on the west side was embraced within the limits of the present Lawrence, Tenth and Wynkoop streets; and on the east within those of Larimer, Seventeenth and Wazee streets. On the west the intermediate cross streets were lined with small business houses; but on the east they were less so. It is to be remembered that in these years the "business" carried on in many of these "business houses" was transacted over saloon counters.

Our present stately Sixteenth and Seventeenth streets were then considered as mere by-streets leading to Larimer and its adjacent parallels. They retained this humble place in the public esteem for a long time afterward. Fifteenth fared better, and later became a rival of Larimer as a business thoroughfare; and nothing but subsequent freaks of Fortune kept it from becoming what Sixteenth and Seventeenth now are.

The definitions of the business sections stated in the foregoing are only general. Within the areas specified were many dwellings, so that these districts, as divided by the creek, were not wholly occupied by business structures, by a good deal.

Cherry creek had to be reckoned with, but its broad bed had been farther and farther encroached upon.

On the other side of the Platte there was but little evidence of progress toward making that quarter a built-up part of the city. A few houses had been erected, but the people generally were averse to putting the river between themselves and the town. Considerable and profitable small farming, and gardening, were done over there, but there were no indications that it would become the large and beautiful section of the city that it now is.

In February, 1864, a young man named James D. Clarke contributed a sensation that stirred the community from center to circumference. He was pay clerk at the Denver "Mint" and had charge of a large amount of money. On the 13th of the month he helped himself to between $10,000 and $11,000 worth of gold bullion and decamped. He was a highly respected young man and had led an exemplary life; being prominent and popular in social affairs and a favorite among the business men. He left town on horseback, and was soon vigorously hunted for, as a reward of $1,000 was promptly offered for his arrest. Within a few days he was captured on the plains, of which he was entirely ignorant and destitute of experience, while apparently heading for the Indian Territory. Nearly all of the bullion was found in his possession. Clarke was put in jail and remained there several weeks awaiting trial. One night he succeeded in escaping and in getting far away, for efforts to recapture him were fruitless, and he was never again seen or heard of in this city. It was surmised that through the intervention of influential relatives and friends in the east a way for Clarke's escape had been opened after the slight loss had been made good. Before entering the mint, Clarke had been bookkeeper for the Rocky Mountain News, and was highly esteemed by his employers.

Cherry creek between Larimer street and the Platte the day after the flood.

From the beginning of things here in 1858 until May, 1864, historic Cherry creek had been an inoffensive little stream in certain seasons of the years, and an invisible one in the other seasons with its broad sandy bed hot and dry. The shallow trough in which its waters occasionally flowed was a physical inconvenience through the middle of the town, but the stream was not supposed to be capable of mischief at any time. As building went on up to 1864, dwellings and business houses became thicker along its banks from Lawrence street to Wazee and many had presumed to occupy part of the channel-way. However, nobody thought much about that, and the possibility of danger did not present itself, at all.

For several days prior to May 19, 1864, heavy rains had prevailed in the mountains and over the region of the headwaters of Cherry creek on the Arkansas-Platte "divide;" and the country between that ridge and Denver also had a full share of the down-pour. The old plainsmen and mountaineers had told of having seen the rivers and creeks of this region suddenly become dangerous, flooding torrents, but as they were assumed to be romancers of rare ability, little heed was given their stories, in Denver. Through May 19th the river and creek were observed to be rising here, and toward evening their condition caused some comment, but no one thought of serious consequences. After midnight the creek suddenly became an angry, roaring torrent that exercised its long-reserved powers of devastation without warning. It swept down upon and through the town like a besom of destruction; through the collection of dwellings, saloons and business establishments that stood directly in its course, it tore its way, and daylight on the morning of the 20th revealed the extent of the mischief it had wrought.

The little old "City Hall" that had stood in the creek bed at the Blake street crossing, was gone, and with it the iron safe in which were the town records and various municipal documents; among these were supposed to have been certain papers pertaining to real estate titles in that period, and their disappearance at that time figured in the historic controversy over what became the "City Lot Question," of which we present an outline in a succeeding chapter.

Away had gone the office of the Rocky Mountain News and all its outfit of presses, type and miscellaneous belongings—scattered along and buried in the sandy bed of the creek or in that of the River Platte. The News' establishment then had been in a frame structure on stilts or posts in the Auraria side of the creek bed at the Market street crossing and on the northward side of that street. Its real and personal property was worth between ten thousand and twelve thousand dollars; and every vestige of it was swept away. John L. Dailey, one of the proprietors, and four of the office employees, were sleeping in the building and had barely enough time to gather up some of their personal belongings and escape. Dailey stopped to take the books and money out of the safe, but had to leave the task unfinished as the building began to sway over into the torrent.

The frame building standing on the south side of Larimer street and partly in the creek's bed, on the Auraria side, used by the pioneer Trinity Methodist Episcopal congregation, was wrecked and swept away. It was owned by Henry C. Brown who had built and used it a few years before for a carpentering shop, the church society having later rented and fitted it up for church purposes.

Wreckage piling against the creek bridges, low, wooden affairs, had early in the proceedings loosened them from their bearings and away they had gone. The South Platte had risen to an unprecedented stage, flooding far beyond its nominal limits, and had quickly demolished the bridge at the foot of Eleventh street and another at the foot of Fifteenth.

Auraria lying generally on lower ground was flooded to the depth of several feet and in many instances people in endangered houses were rescued in boats. Nearly all of them were surprised in their sleep by the raging torrent. Houses not carried away were in many cases shifted from their foundations, and in a few instances moved into the streets.

Large areas of land up Cherry creek and up and down the South Platte were covered with water, causing great losses to ranchmen in stock and buildings swept away. From Captain James Reed's ranche on Plum creek four thousand sheep were carried off and drowned.

But the worst of the misfortune was the loss of human life. How many persons perished in the full extent of the flood was not definitely known. In Denver and its immediate vicinity there were eight victims: C. Bruce Haynes who was sleeping in one of the wrecked buildings; Gumble Rosebaum, a clothier; Otto Fisher, a boy four years old; Henry Williams, a ranche-hand; and I. R. Tyson, wife and two children. A woman and two children were drowned in Cherry creek some distance above the town, and another woman with the same number of children lost their lives in Plum creek; August Mertz, of Denver, was carried eighteen miles down the Platte river on some wreckage, before he could get ashore.

The financial loss of this second great physical misfortune to the young city, was principally the value of the destroyed buildings and their contents. The Indian troubles which broke out that summer, greatly augmented normal values by reason of the extraordinary expense they entailed upon the transportation of supplies and materials across the plains to replace what had been swept away; so, it is probable that the estimate of a quarter of a million dollars' worth of loss, direct and indirect, by the Cherry creek flood of 1864 was not far out of the way of accuracy. The bank building of O. D. Cass & Co., was wrecked, and A. E. and C. E. Tilton lost their building, stock of merchandise, and their lot to boot. They had about six thousand dollars' worth of goods. F. A. Clark, General Bowen, August Mertz, J. Q. Charles, and several others lost their buildings with all their contents, and the sandy sites on which they had stood. The minor losses were distributed over a considerable part of both towns.

Large quantities of merchandise were damaged by water in the business districts below Larimer street, on both sides of the creek, where the flood was several feet deep. The streets were left covered with a foot or so of sand and mud which was also left in the buildings to almost as great a depth.

The flood washed away about all that remained of the old sectional feeling between the towns, that had survived the consolidation. In the presence of the common misfortune it disappeared and was never heard of again. Another consequence was somewhat detrimental to the west side, as the flood had shown that its lower situation in its extent of that time made it subject to greater damage by high water than would come to the east side. Therefore, some of the west side residents moved across the creek to higher ground, and in a few instances moved their frame dwellings, also.

Years afterward when Colonel James Archer was sinking the well at the foot of Fifteenth street for the first waterworks, his workmen struck part of the News' old hand press twelve feet below the surface. About the same time parts of the large cylinder power-press were found in a bar in the Platte opposite the foot of Twentieth street, and are still there, and visible in low-water times. In the autumn of 1898 the lever of the old hand-press, with some type, and other printing office appliances were uncovered by workmen digging for foundations in the creek bed for one of the approaches to the new over-the-river viaduct from Fourteenth street. The hand-press relics are now in the Historical Society's collection, and they, with the rusted remains of the cylinder press in the river bar are all that were ever seen of that mechanical outfit of the Rocky Mountain News after the 19th of May, 1864. Within a month after the misfortune Byers and Dailey bought the "Commonwealth" printing establishment and, discarding that paper's name, resumed publication of the News.

Far across the open country to the eastward, on the brow of what is now our Capitol Hill, Henry C. Brown built a little frame house early in the spring of 1864, as evidence of his homestead right to a quarter-section of land on part of which it stood. He entered a claim for the one hundred and sixty acres, consisting of four "forties," on April 15th of that year, as a homestead, at the nominal government price of two dollars and fifty cents per acre. He had previously utilized in eastern Nebraska his pre-emption privilege, and to acquire this land had to take it as a homestead, under the laws and regulations then in force, which forbade more than one pre emption of government land by the same person. But, after six months' residence on the land, a "homesteader," under a provision of the land law, could "prove up," and by making the entire payment at once get the land at one dollar and a quarter an acre. Brown did this on December 1, 1865, paying $200 for the quarter section. Part of the site of the Brown Palace Hotel and ten acres of the fine park of three entire blocks in which the State Capitol stands, are portions of that quarter section. Mr. Brown's donation included the ground occupied by the two streets through the park, and for the remainder, that lying between Lincoln Avenue and Broadway, the State paid other parties one hundred thousand dollars. Not a great while after Mr. Brown entered that land he had an offer of five hundred dollars for the entire tract. After some consideration he declined it, and the man who made it said he was glad to get out of the proposed deal, as he had concluded that the "sand hill" was not worth five hundred dollars and never would be. It later became "Brown's Addition" to the city of Denver, and made its owner a very wealthy man.

View over part of "West Denver," from Fourteenth and Lawrence streets, the day after the flood of 1864.

The little homestead house first stood at or near the present intersection of Sherman and Twelfth Avenues, but later in 1864 Mr. Brown moved it down on the block on which the Broadway Theater now stands, and located it in what is now the side-yard of the Augusta W. Tabor residence there, on the south end of the block, where it continued to serve as his dwelling for several years.

The Denver Town Company had claimed that part of Capitol Hill and had included it in the original plat of Denver City, as shown by our engraving of the first map of the three Cherry creek towns. When Mr. Brown began building the preemption house, R. E. Whitsitt, of the Denver Town Company, put in an appearance and demanded to know what he was doing there. "I seem to be building a little house," replied Mr. Brown. "Well," exclaimed Mr. Whitsitt, "you've no business to be building houses here; you get right out!" Mr. Brown, hatchet in hand, stepped forward as he answered: "Dick, this is my land. I'm not going to get out, and you can't make me." Mr. Whitsitt, with some profane but altogether inconsistent remarks about the wickedness of "land-jumpers," turned around and strode down the hill; and that was the last of the Town Company's protest against Brown's right to his quarter-section.

In June, 1864, Alfred H. Clements pre-empted the quarter-section next to Brown's, on the north, and paid Mr. Brown one hundred dollars for building on it a small frame pre-emption house which was put up on the ground now occupied by St. John's Cathedral. Late in 1864 Dr. Cunningham built a frame house near the Ebert school, in Clements' addition. These two houses and that of Brown's were far outside the very liberal nominal limits of the city, and were not considered as having anything to do with it. In these times there was little or nothing between Curtis street and Capitol Hill, and that section of the city seemed far less promising than the old Highland district on the northward side of the Platte; though the latter was still, in 1864, hardly worthy the name of a town if it had stood off by itself.

In the summer of 1864 while the Indian situation appeared extremely menacing to Denver a new danger arose and was thought to threaten the city. Late in July a band of mounted outlaws, or guerilla "road-agents," numbering twenty-two men, under "Jim" Reynolds, came out of Texas into southern Colorado. They claimed to be Confederates, but were mere land-pirates of whom the Confederacy knew nothing and for whom it was in no way responsible. Reynolds had been in 1859-60 a miner in the South Park country, but had gone south at the outbreak of the war, and turned desperado. The band came up the Arkansas valley, capturing wagon trains and committing other depredations. Fort Lyon was avoided, and Pueblo and Canon City left unmolested as the party made its way into the South Park. There the work of robbing ranchmen, miners, stage coaches and mails, and of destroying property was begun in earnest. Reynolds boasted that he would raid Denver and sack and burn it as Lawrence, Kansas, had been treated; and was actually heading this way. The South Park country was soon up in arms, and several parties were organized to hunt down the outlaws. One of these, under Dick Sparks, of Gold Run camp, came upon the band in camp on Deer creek in a remote part of the Park. Approaching stealthily to within range, Sparks' men fired on the party, killed one man named Singleterry, and wounded Reynolds, who escaped; the others also taking flight, leaving much of their plunder in camp behind them, where Sparks recovered a large amount of valuable property. Another party of pursuers later captured one of the scattered band, named Holiman, and took him to Fairplay where, by threats of instant lynching, he was persuaded to reveal the locality of appointed rendezvous, and agree to act as guide to it. On the following day a party set out from Fairplay taking Holiman along, with death hanging over him as the penalty for treachery. The party proceeded in the direction of Canon City, and on the way fell in with a company of the First Colorado Cavalry, under Captain George L. Shoup who was also hunting the outlaws. With Shoup were Judge Wilbur F. Stone, now of Denver; United States Marshal A. C. Hunt, and several other civilians. Holiman led the united parties to a point near Canon City where Reynolds and part of his men were found. In the fight that ensued Reynolds and four others were captured, the rest managing to escape. The prisoners were brought to Denver and after an alleged trial by the military authorities, the proceedings being kept secret, the outlaws were ordered taken to Fort Lyon.

Much mystery surrounded the subsequent proceedings and the fate of the prisoners. A company of the Third Colorado Cavalry, under Captain F. G. Cree, started south with them, and that was the last definite public knowledge of the outlaws. It was stated that Cree had orders to shoot them if they made trouble or attempted to escape. In Douglas county the journey to Fort Lyons came to an end. There were contradictory accounts of the disposition made of the men. One was that Cree had orders to dispatch them somewhere on the route and that it was never intended that they should be taken to Fort Lyons; another, and with a color of authority, was that part of the command, with the prisoners, stopped for water, when the prisoners made a break for liberty, in a bunch, were fired on and all killed; still another, that the outlaws by abusive language and threatening movements, notwithstanding Captain Cree's warning that such conduct would probably result in their death, provoked a melee in which all the desperadoes were killed; yet another was to the effect that in camp the first night the prisoners were tied to trees for better security, and in their struggles to get loose strangled themselves—a round-about way of saying they were lynched. Wooton, in his entertaining, if not always accurate, narrative, states that while traveling the old road between Denver and Pueblo several months afterward, he camped in a timber-growth about twenty-five miles south of Denver and there saw the skeletons of three men standing upright in their boots, lashed to trees, the tattered clothing hanging in shreds, and bullet-holes in the skulls. These, he says, were what were left of three of the Reynolds gang.

Nobody outside of those present at the disposition of the prisoners appeared to have ever learned the straight of the story. Considering that an entire military company must have known more or less about it, the secret was remarkably well kept. The story of the prisoners' death while trying to escape was never regarded as a probable one, for it would seem singular that so large a guard-escort could not securely keep so small a number of prisoners. Though Reynolds and his associates probably deserved death, the manner of their taking off was, as it should have been, severely condemned for the evident treachery and cowardice associated with it. Captain Cree and his men came back to Denver from Douglas county and, as would be said nowadays, "declined to be interviewed." However, the dispersion of the Reynolds band of guerrillas was a conspicuous fact apparent to every one.

During the first six years of Denver's existence the town was almost barren of every kind of verdure, besides being beset by dust-laden breezes. In the built-up parts, excepting in a few places on the Auraria side, there were no trees, no grass, no flowers. Without irrigation they could not survive, and water for such purposes was a scarce element in those years. For other purposes it was obtained from wells, or hauled by cart or wagon from the river. These sources of supply and the methods of delivery precluded use of water on the streets or for any kind of irrigation. Therefore the town presented aspects of extreme dreariness. With 1865 a change greatly for the better, was inaugurated. What we now know as the "old City Ditch," winding its long course from far up the Platte and along and around the ridges of which our "Capitol Hill" is a part, was completed early that year, and immediately followed by tree-planting and lawn-making in all that there was of the residence districts, and which brought a great and welcome change in the appearance of the town. Streams of clear, cold water flowed at the sides of the streets to which it could descend from the hill, including some of the business streets—a practice that was continued many years. Its presence was a charm and delight to many people, but in later times the iconoclastic physicians said it produced conditions antagonistic to the public health. This, with the still later introduction of asphalt street-paving, led to abandonment of the general practice, though it is continued in some localities, especially in "West Denver." In the summer of 1898 the gutters of Grant and Logan Avenues north from Eleventh Avenue bore such streams until street improvements made them inexpedient.

The wind-storm which won and keeps the first place in wind-storm rank in Denver annals, was that of Christmas, 1864. It began in the morning of December 23d and continued a terrific gale without much interruption until the 26th when it terminated in a stormy period of heavy snowfall. The gale was so powerful as it rushed through town that people were taken off their feet; the belittered streets were swept bare, and the air was clouded with flying rubbish of every sort. Many people believed their lives to be in danger. On the first day of the storm, Major J. H. Fillmore, a man of much prominence and usefulness in the community, was prostrated by excitement and his death ensued from the consequences. The material damage in the city was not of any serious importance. Major Fillmore at that time lived in a dwelling built and for a couple of years occupied by J. H. Kehler, who was a son of the church pioneer, "Father" Kehler.

By the close of 1864 most of the damage done by the fire of 1863, and by the flood in Cherry creek, had been made good. The new and uniformly good buildings that succeeded the destroyed ones had given the central portion of the east side what was thought to be a metropolitan appearance, and placed "East Denver" still further in advance of the old Auraria district, which did not begin to recover its prestige until after the advent of the railways.

The action of Congress in passing the Pacific Railroad bill in 1862 had caused the people of Denver to entertain the most sanguine expectations of soon being in possession of railway communications both east and west, for it was not questioned by any one here that the proposed transcontinental road could or would be built on any route not passing through the young city far out here at the base of the mountains. On the strength of confidence in the coming of the Pacific railway, property began to advance in assumed values and the future prospects of the town took on a brighter hue. But there were yet to be years of delay, deferred hopes, and grievous disappointment before the iron trail supplanted the tedious and dreary pioneer ways over the plains, and ended the pioneer era in Denver.

CHAPTER XXXVIII.

Denver in the Civil War Period—Conditions in Winter of 1860-61—Divided Sentiment of the People—First Flag-Pole Raising—Confederate Flag in Denver—Trials of the Situation—Activity of Southern Element—Military Preparations—First Colorado Regiment—Governor Gilpin's Drafts—Difficulties Growing Out of Isolation—Sibley's Confederate Army of Invasion—Its Advance and Defeat—Colonel Chivington's Services—Subsequent History and Operations of Colorado Military Organizations—Their Gallant Services Through the War.

While a majority of the men in and around Denver in the winter of 1860-61 were from the northern states, and enthusiastically sincere in their devotion to the Union cause, a relatively large minority, of other antecedents, included many of strong character and influence, and of outspoken loyalty to the course and purposes of the seceding States.

So active was that minority that political sentiments heard expressed on the streets and in other public places made it appear that Denver as a community was prepared to join the southern cause. Hiram P. Bennet, then as now a sincere lover of his country, knowing that Union sentiment was strong in the town, determined about the middle of February that there should be an occasion for its public manifestation. At his own expense he procured from the mountains a flagpole about thirty feet long. Being unable to find in Denver an American flag of suitable size, he obtained one in Golden by trading for it a lot in that town. On the morning of Washington's birthday he invited his friends and all other Union men to meet at his home, then on Ninth street between Lawrence and Curtis streets, in the afternoon. A large crowd was present and the pole was raised in the street nearly in front of Judge Bennet's house. With some spliced lariats the flag was run up, Judge Bennet made an address, and the enthusiasm of the assemblage demonstrated the existence of a broad and deep-seated Union sentiment in Denver. That was the first public pole-raising and flag-flying in this region under what may be termed political circumstances, and the general effect of the demonstration was immediate and influential. Judge Bennet remarked to the writer that he could not say that the enthusiasm manifested by every individual present was wholly due to patriotism, for in addition to the pole and flag he had provided four and one-half gallons of other stimulation.

But here, as elsewhere all over the land through that memorable winter, most of the people still hoped that the Nation would not be plunged into the horrors of civil war over the issues which were then crystallizing the deep-seated sentiments and convictions which had long been portending a division of the country on sectional lines. Notwithstanding that a large number of men had left Denver and the mountain country the previous autumn for their former homes in the States, impelled to do so by their sense of duty in what they thought was a fast-approaching conflict at arms, a majority of those who remained here tried to believe that some means of peaceful settlement of the difficulties would yet be found.

These hopeful feelings prevailed in Denver through that winter and far into the following spring; and it was not until news of the attack on Fort Sumter reached the little city that they gave way to the realization that war was inevitable. The first physical evidence in Denver of a divided allegiance then promptly appeared. On April 24th an emblem of the new government that had arisen in the southern States was run up over the general store of Wallingford & Murphy. This building, erected in 1859, was a log structure which stood on the north side of Larimer street a short distance west of the corner of Sixteenth street. Almost instantly the vicinity was crowded by excited and angry men, who declared that the flag of disunion should not float in Denver. There were some who thought it should and would; and a riot seemed not far away. But the Union men far outnumbered the others and demanded the flag's quick removal. Without standing upon ceremony, Samuel M. Logan, who soon afterward became a Captain in the First Regiment of Colorado Volunteers, got on top of the building and hauled the flag down before it had fluttered long enough to smooth out its creases and wrinkles. That was its first and only public appearance in all the country that is now Colorado, though several such flags were privately exhibited in Denver. With something akin to retributive justice the Wallingford & Murphy building later became a military prison.

The circumstances of those times placed Denver in a peculiar and trying situation; one calling for prompt and decisive voluntary action by courageous and steadfast men. The region was still without effective government, for, notwithstanding that Congress had in the previous February created the Territory of Colorado, the officers appointed to institute and maintain lawful government in and for it had not yet arrived to enter upon the discharge of their duties. Isolated by six hundred miles of rolling plains that lay between it and the borderland of the settled portions of the country to the eastward; menaced by southern influences that were already plotting and conspiring to drag New Mexico and even Colorado into the domain of the Confederacy; and surrounded by hordes of Indians to whose nostrils the scent of civil war among the people they regarded as their common enemies was as a sweet incense, the condition of the little community here was gloomy and disheartening.

Up to that time Denver's organized military strength had not been awe-inspiring. At the beginning of 1861 it consisted of two militia companies which had been organized under the "act" of the "Jefferson Territory" "Legislature" authorizing a military establishment for "Governor" Steele, and to which we have heretofore referred. One of these was the Auraria "Jefferson Rangers," commanded by Captain H. H. C. Harrison, and which had seen some "service" in the "Turkey War" of the previous year. The other was Denver City's "Denver Guards," a mounted company under command of W. P. McClure, who was an ardent and outspoken adherent of the southern cause. These companies would seem to have had things wrong end foremost, for the "guards" should have been on foot and let the "rangers" have the horses if there were much ranging to be done. However, that was of little consequence, for both companies disbanded late in that winter, and, therefore, as organizations were not known of men in the events of the civil war; though a large proportion of their members enlisted in the regiments organized later.

The extraordinary activity and enthusiasm of the southern people in preparing for and entering upon the great conflict were manifested in the southwest with the same sanguine zeal that attended them in other parts of the seceding section. It was anticipated by them that the whole country up this way and through to the Pacific would, or could be made to, pass under their new government. The Confederate authorities in Texas, and their sympathizers in New Mexico and Denver, believed and expected that a force sufficient to take possession of New Mexico and then of Denver could be readily and easily sent forward from that State; and that the task to be assigned it would present few difficulties. At Fort Union, New Mexico, there was an arsenal that Buchanan's Secretary of War, Floyd, a southern man of extreme views, had caused to be well supplied with arms and other munitions of war; and in addition thereto large quantites of miscellaneous stores and army supplies had been collected there. In possession of all this material—for the post was occupied by but a small force of Federal soldiers—the Confederates argued that they could speedily make themselves masters of the situation in the distant and then isolated Colorado-New Mexico region.

The Texan Confederates early had a demonstration of the advantages afforded by possession of United States military supplies. In the spring of 1861 General Twiggs, of the old army, but a southern man and sympathizer, was in command of the military Department of which Texas was the most important portion. He immediately surrendered to his friends all the troops, military posts, munitions of war, supplies and stores under his charge. With such a windfall as all this to begin with, the Texans had no doubt but that they could march up into this region and capture and hold every place and thing which lay in their way.

At that time United States military affairs in New Mexico were under command of Colonel Loring, a North Carolina man and a southern sympathizer, also. He and other officers of like proclivities endeavored to induce the troops under them to join the Confederate forces that were being organized in Texas, but failed. Soon afterward, Colonel Loring resigned and entered the Confederate army. After much and, as events proved, costly delay, Federal army affairs in that Territory were placed under the command of General Edward R. S. Canby, with Colonel B. S. Roberts next him in rank.

Governor Gilpin reached Denver on May 29th, and without delay proceeded to organize his government of the Territory, the first lawful one which the pioneers of the city may be said to have had. He was, fortunately, a man of decision and action, and of unwavering fealty to the government he had served so long and well. An old army officer who passed several years of his useful life in service on the frontier, he arose to the emergency, as he had to many lesser ones in his long career, with a promptness and determination that gave neither side any reason to doubt or question the attitude of the Territory's chief executive toward the southern uprising against the Nation's authority.

In June Governor Gilpin organized his military staff, with Richard E. Whitsitt as Adjutant General; John S. Fillmore, Paymaster; Samuel Moer, Quartermaster General; and Morton C. Fisher, Purchasing Agent. His government then took on more of the character of a military than a civil establishment, and he became far more a military officer than a civil Governor. He was absorbed in his devotion to the Union cause, and appreciated the gravity of the situation. His sincerity and zeal excused, if they did not justify, many of his impetuous acts.

In July John P. Slough, one of the pioneer Denver lawyers, was commissioned from Washington upon Governor Gilpin's approval to recruit two companies of infantry to relieve the regulars then garrisoning Fort Garland so that they might be sent east. Samuel F. Tappan, who soon became Lieutenant-Colonel of the First Colorado, also enlisted a company in the Central City districts, and the war spirit began to glow and flame. There were neither arms, munitions, nor supplies for soldiers in Denver at that time, and the Territorial treasury was like the bed of Cherry creek in drouthy midsummer. But Governor Gilpin announced his purpose to immediately recruit and organize a full regiment of Colorado volunteers, for which he claimed to have authority. To arm his soldiers the Governor directed his military staff to go forth among the people and buy up all the guns they could find. Nearly every man here at that time had a rifle or a shot-gun, and there soon was collected a motley assortment of weapons, for which, under the circumstances, high prices had to be paid—or, rather, promised to be paid—and of which few were alike.

Colonel John P. Slough.
(From a war-time photograph.)

In the meantime, however, the Confederate sympathizers in Denver were quiet but not inactive. Its leaders were resolute men firmly believing in the righteousness of their cause. They were apprised of the contemplated campaign from Texas against New Mexico and Colorado, and as best they could without making their purposes conspicuous, they began organizing, or trying to, a local force to co-operate with the anticipated invasion from the south, preparations for which were then actively going forward in the Lone Star State. The Denver insurgents found it easier to enroll themselves than it was to find a way to procure suitable arms, and all the things needed to make them effective. Equipping a military force surreptitiously in a community generally hostile to its purposes is a most difficult thing to do. They could not bring in arms and munitions from the outside in any numbers or quantities, for there were no available sources from which to draw them; and if there had been the chances were that any such shipments made would be discovered and seized by the vigilant Union men. So, Denver's embryo Confederate military chieftains decided they would modestly advertise for the things they needed to equip themselves for war. Small hand-bills containing an announcement that good prices would be paid for serviceable rifles of almost any kind not wholly out of date, and for ammunition to make them useful; and naming certain places where the guns and so forth would be received and paid for, were posted here and there through town, in the adjacent mining camps, and all along the roads and trails between. But this availed them not. Governor Gilpin had not been long in Denver before these misguided citizens discovered that if they succeeded in co-operating with their expected friends from Texas they would have to get outside of Colorado to make their preparations. Therefore, the Confederate movement in Denver abruptly terminated and those engaged in it who were determined to take up arms in behalf of the southern cause had to leave the city quietly as individuals, and not as an organized military force marching forth with the pomp and circumstance of alleged glorious war. Many of them did leave and enter the Confederate army, and in it served manfully throughout the struggle. They had the courage of their convictions. Of a later attempted movement to recruit a Confederate regiment in Colorado, and which brought an awful fate on two men conspicuously, if not worthily, identified with Denver's pioneer history, we have already given some account.

Governor Gilpin hastened his preparations for organizing his regiment, and in August commissioned the officers of the First Regiment Colorado Volunteer Infantry. John P. Slough, whom we have mentioned as having been commissioned from Washington to recruit two companies, was appointed Colonel. Slough was a talented member of the Denver bar and an unflinching War Democrat. Samuel F. Tappan, who had almost completed his company, was named as Lieutenant Colonel; and John M. Chivington, Major. Chivington, who was destined to become a conspicuous military figure, had arrived in Denver on May 19, 1860; coming as the first Presiding Elder of the Methodist Episcopal church in the Rocky Mountain District. He was first tendered the Chaplaincy of the regiment, which he declined, and asked that he be assigned to a fighting position. The Captains as originally appointed were as follows, though several changes among them were soon made: Company A—E. W. Wynkoop; B—S. M. Logan; C—Richard Sopris; D—Jacob Downing; E—Scott J. Anthony; F—S. H. Cook; G—J. W.

Hambleton; H—George L. Sanborn; I—Charles Mailie; K—C. P. Marion. Recruiting offices were opened in Denver, the mining towns, Canon City, Colorado City, Golden City and Boulder City. Before the close of September the quota was filled, and it is doubtful if there were ever organized into a regiment the material for a thousand better soldiers than these who responded to Governor Gilpin's call and constituted the First Colorado.

The two companies of men first authorized to be recruited in Colorado had been at Canon City, but at this juncture were moved to Fort Garland where they were mustered into service under command of Captains T. H. Dodd and James H. Ford. They were sent to Santa Fe to be uniformed and equipped, after which they remained unattached until the next year. After taking part in the military operations in New Mexico in the spring of 1862, they became the nucleus of the Second Colorado regiment.

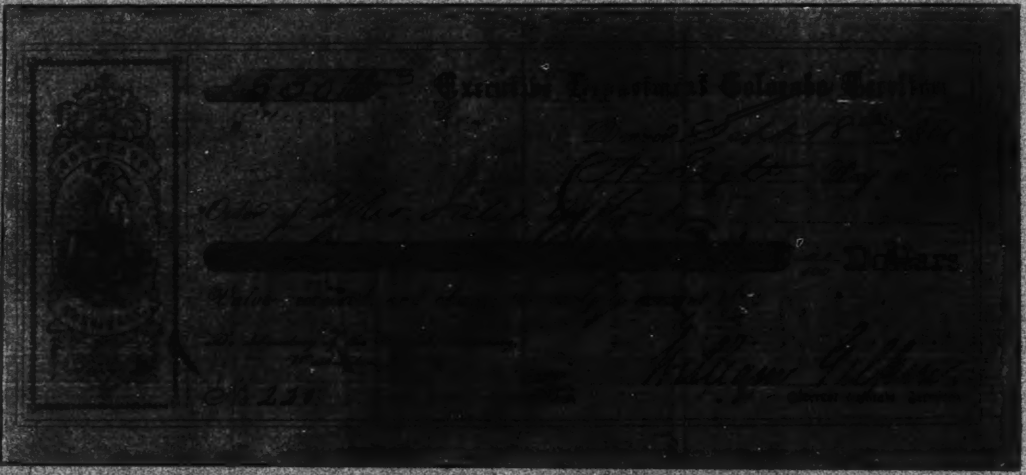
Lieutenant Colonel Samuel F. Tappan. (From a war-time photograph.)

A military camp had been established on the Platte river about two miles above what there then was of Denver, and named Camp Weld in honor of Territorial Secretary Lewis L. Weld. Its locality is just west of the present Lake Archer, and was A. C. Hunt's old home ranche. The First Regiment rendezvoused there and was kept pretty steadily at drill, discipline and camp duty through the autumn and until the new year came in. It had been expected that the regiment would have entered active service that autum, and the long delay with the irksomeness of camp life caused much dissatisfaction and muttering among the men. Their first equipments were poor, and the delays in getting better arms, uniforms, and all the war paraphernalia of a regiment, coupled with certain circumstances we are about to relate, produced a most unpleasant condition of affairs.

The business of organizing even one regiment involves the expenditure of a large sum of money. The men must be armed, clothed, fed and supplied, and all the incidental expenses of doing so must be provided for. The Territory had no funds, nor had the Governor authority to use them for military purposes, if the treasury had contained them. The government at Washington had placed no military funds at his disposal, nor had it conferred on him the power to create indebtedness on government account. But the Governor met the emergency with a method that he believed to be proper and justified. In payment for military supplies and expenses he issued negotiable drafts directly upon the Treasury at Washington, for which he had not the shadow of legal authority. These drafts were willingly accepted by those to whom money was due on military account, and many of them passed from hand to hand in Denver as currency, upon the presumption that they were valid documents that would be paid without question when they finally reached Washington. The aggregate of such drafts issued in that year was near $375,000.

As fast as these drafts got to Washington they were repudiated by the Treasury Department and went to protest. The effect was disastrous upon merchants and many others in Denver who had made great sacrifices to assist in organizing and maintaining the troops. Governor Gilpin's situation may be imagined. Public feeling against him here became of extreme bitterness and he was assailed upon every hand by the exasperated and impoverished holders of his drafts. As an old army officer he was held to have known the government's rigid financial methods, and it was principally because of his assumed knowledge of such matters and of his supposed authority that the people had unquestioningly accepted his irregular and unauthorized drafts. Then there was a storm at Washington over them, which the Governor endeavored to allay, and obtain payment of the drafts, by a personal visit; but unsuccessfully. The question finally became one for Cabinet consideration, and early in 1862 resulted in a decision to remove Governor Gilpin as soon as his successor could be determined in those times of strain and turmoil for the Washington government. In May, 1862, John Evans came as Gilpin's successor.

After Governor Evans' inauguration a large portion of the indebtedness was paid by the Washington government. Original holders of the drafts who could prepare itemized and verified accounts of their claims for which the drafts had been issued, succeeded after some delay in getting their money. John S. Fillmore had been appointed Paymaster in the volunteer service, from Washington, and these accounts were placed in his hands and through his efforts at Washington they were recognized, audited and paid. But the drafts themselves were not recognized in any way by the Treasury Department, and every one of them that had passed from original hands and could not be successfully thrown back upon those to whom they had been issued, became a total loss to the holders. In the nature of things these losses were heavy. The payees had become scattered, some were impecunious, and therefore much of the paper was worthless.



Face of one of Govenor Gilpin's Drafts. (Near exact size.)

Back of the Draft, showing indorsements.

But, through all the trouble no one questioned Governor Gilpin's integrity, the purity of his purpose, the loftiness of his patriotism, or the sincerity of his zeal to protect the people from invasion, and to serve them to the best of his ability. He was in many ways a visionary man whose mind and thoughts were often far above the practical affairs of every-day life; and when that emergency came his enthusiasm for the Union overshadowed all other things. Notwithstanding the unfortunate results that grew out of his methods of financing his military preparations, the people of Denver and of Colorado were immeasurably indebted to him for the promptness, vigor and earnestness with which he prepared for war.

The First Regiment remained at Camp Weld until early in January, 1862, performing routine duties, and becoming more and more anxious for active service. On January 6th news reached Denver that the Confederate General Sibley was marching northward through Texas along the Rio Grande, had captured Forts Fillmore and Bliss down there, was approaching Fort Craig with the expectation of taking it and then marching upon Santa Fe, with the ultimate object of invading Colorado and possibly capturing Denver. With this startling intelligence came a call upon Denver for all the assistance she could give toward repelling the prospective invaders.

At that time a majority of the Americans in New Mexico, as was the case in Colorado, were from the Union States and were Union men. The movements in Texas in the summer of 1861 preparatory to starting the Confederate army of invasion and presumably of victory on its march northwest, caused great apprehension at Santa Fe and other places down that way. When General Canby assumed command of that Department he found but one thousand soldiers—all regulars—available for service in New Mexico. But that Territory, in which the Union sentiment strongly predominated among the American part of the population, had quickly organized two regiments of volunteers, one of which was commanded by Colonel Ceran St. Vrain, with Kit Carson as Lieutenant-Colonel.

But these additions to General Canby's available forces were not enough to remove apprehension of great and immediate danger from the expected Confederates whose numbers were vastly exaggerated in the current reports. The appeal for assistance was made to Colorado, and as Denver in those days constituted the larger part of tangible Colorado from a military standpoint, the appeal was, therefore, practically to this city.

In those dark days in the Nation's history the people in these then remote regions had to depend on themselves. It was quite useless to pass the New Mexico call for help along to Washington. The threatened invasion of New Mexico and Colorado was a thing of little relative importance at the National capital in the presence of the grim fact that the legions of the south might be marching down Pennsylvania Avenue almost any day. Beside that, what difference would it make if the southerners did invade those remote Territories of awful mountains and dreary deserts peopled by Indians, Mexicans and a few thousands of American adventurers. Indeed, if all the Confederates could be persuaded to go out there and do their marching and fighting it would be much better for everybody.

The absence at that time of quick communications with the States, and the government at Washington, added to the difficulties of the situation here, and to the embarrassments of the Territorial and military authorities of Colorado and New Mexico; for, be it remembered, a Territorial government is one of limited powers, and in those days here in the west, was of still more limited resources. Arming, equipping, and providing for soldiers consumes money rapidly; and when cash is lacking and the public credit must take its place, there must be some authority for creating the indebtedness; although our Governor acted upon a different theory. There were no railroads nearer Denver than the Missouri river, and the nearest telegraph wire was more than a hundred miles away. The transmission of orders, communications, and general news across the plains consumed a week, unless telegraphed to Julesburg, and no one could tell how much the situation had changed or would do so in such tedious intervals of anxious waiting.

Let us now turn to affairs in Texas and see what cause there was for this alarm in New Mexico that prompted the call on Denver for assistance. The New Mexico-Colorado campaign on the part of the Confederates had been determined upon as one of their primary military operations. General H. H. Sibley, a distinguished officer of the old regular army, had been charged with the duty of organizing the army of invasion and with that of commanding it in the field. He established his headquarters at San Antonio, Texas, early in the summer of 1861, and there began recruiting and organizing his regiments. But he, also, encountered delays, and his expectation that he would be in motion and well up into New Mexico by autumn gave way to disappointment. It was late in the autumn before he had his little army of about two thousand five hundred men, mostly Texans, compacted, drilled, and otherwise in shape for active campaign work; and notwithstanding the reports from day to day at Santa Fe that it had started on its invading march, the year drew toward the close before the campaign could be actually begun.

In preparation for meeting the invading Confederates under General Sibley, General Canby late in the autumn assembled his available forces at Fort Craig, far down on the Rio Grande, in New Mexico. His little army consisted of a thousand regular troops from several different regiments, the two regiments of New Mexico volunteers, and Dodd's company of Colorado volunteers that had been hurried forward, and a small body of the New Mexico Territorial militia—in all about twenty-five hundred men.

As we have stated General Sibley had been seriously delayed in 1861 in his preparations for the campaign; but early in January, 1862, he set forth to conquer New Mexico and Colorado. On his way, Sibley captured Forts Filmore and Bliss which were occupied by small garrisons, making prisoners of the soldiers, and getting all the supplies, stores and stock at the two posts, without fighting. A few of the prisoners were prevailed upon to join the Texan ranks and the others were paroled. He then advanced up the Rio Grande and on February 19th crossed that river a short distance below Fort Craig, seeking to avoid Canby until a favorable position could be occupied. The latter, to keep Sibley from reaching high ground overlooking and to some extent commanding the Fort, placed part of his force where such a movement could be prevented. Nothing further of importance happened that day, but on the next, the 20th, a collision occurred between part of Sibley's troops and those which had been stationed to intercept his occupation of the commanding elevation, which resulted in Canby withdrawing the Union forces to the Fort.

By this time Sibley's men were sorely troubled by the lack of water, and his animals were suffering from the same cause. The abrupt, high banks of the Rio Grande prevented him obtaining an adequate supply from the river at or near where his army lay awaiting further events, and the nearest point where the water of the river was readily accessible was about seven miles above Fort Craig. Early in the morning of the 21st, General Canby sent a portion of his troops, under command of Colonel Roberts, to keep the Texans away from the river at that place. The Confederates, just as anxious to get there as the gallant Roberts was to head them off, were also early birds that morning on their way to the watering place.

Roberts was a little ahead of the Texans in reaching it, and when they came up the trouble began and the battle of Valverde was fought. Compared with the great battles of the civil war, it was but a skirmish. However, it was an important victory for Sibley, for he succeeded in not only watering his famishing men and beasts from the currents of the Rio Grande, but he took a battery of guns from Roberts and added them to the equipment of his exultant Texans.

This battery was under command of Captain McRae. When he was ordered to take it across the river to the side on which the Confederates were approaching he pointed out to Canby that such a move meant its loss and the death of his men. But he obeyed orders, and in the fight over the guns he and most of his men were killed. Captain Dodd's company of Colorado men bravely supported the battery and nearly half of them were killed or wounded.

Encouraged by the success that had attended his encounters with the Union forces from Fort Craig, and feeling better after having quenched his thirst, General Sibley struck out northward, leaving General Canby and Fort Craig in his rear. Albuquerque offered no resistance to the invaders and contributed largely to their already burdensome supply of stores and munitions. From Albuquerque Sibley pushed forward to Santa Fe which he also occupied without resistance and with the approval of the more prominent Mexican citizens. By this time it seemed that General Sibley might march through to British Columbia if he wanted to, and that Denver was almost certain to receive a visit from him.

The American residents of Santa Fe and the humbler part of the Mexican population were almost unanimously for the Union cause, while the influential higher class of Mexicans were about as solidly arrayed, in their sentiments at least, on the other side. General Sibley had anticipated that as soon as he was in possession of Santa Fe volunteers in droves would join his victorious army; but in this he was bitterly disappointed. The friends he found there among the Mexicans were hospitable and agreeable, but shouldering a gun and taking places in the Texan ranks were not to their liking, nor did they do it. A large proportion of the fighting men of the town were already in the two regiments of New Mexico volunteers with General Canby, and General Sibley began to realize that he would have to get along with the men he had brought from Texas.

But, if the Mexicans had disappointed General Sibley, there was still much worth living for, even if it involved some fighting to get it; a condition precedent which was never very alarming to Texans. There was Fort Union a little way off to the northeast, where the forehanded War Secretary Floyd, of the Buchanan period, had, in one of his many instances of taking time by the forelock, accumulated many small arms and large arms, and great quantities of quartermaster's and commissary's stores, against the close-coming day when the Confederacy would have need for all such things on which it could lay its ready and combative hands. Therefore, and regardless of the fact that General Canby was after him from the South, General Sibley concluded that he would march over to Fort Union and receipt for the abundant supplies which he considered as merely stored there awaiting him.

Captain S. M. Logan.
(From a war-time photograph.)

The old trail from Santa Fe to Fort Union passes through a wild, deep gorge, the rocky walls of which in many places stand almost vertical to a height of from one thousand to fifteen hundred feet. The Atchison, Topeka & Santa Fe railway now passes through this natural gateway—the Apache Canon. It is one of the most picturesque and impressively grand canons in all that region. At the eastward opening of this rocky gulf was, in the war time, Pigeon's Rancho; and here terminated General Sibley's excursion toward Fort Union, and ended his hopes of marching his triumphant legions—or legion, for he had barely enough men to make a single one—to Denver, taking possession of Colorado and lining it up with the then sanguine and enthusiastic Confederate States. An explanation of the causes which brought disaster upon him, and of the circumstances leading up to them, requires us to now consider things that had happened here at Denver, and later in New Mexico. Of the military operations that ended General Sibley's northward march we quote the following circumstantial account from Hall's History of Colorado. After referring to the intelligence received here on January 6th, General Hall goes on to say:

"Immediately upon receipt of this intelligence, efforts were made to obtain the consent of, or orders from, General Hunter, commanding the department at Fort Leavenworth, Kansas, for the regiment to go to the relief of General Canby, then in command of the department of New Mexico. On the 20th of February, orders came from General Hunter, directing Colonel Slough and the First Regiment of Colorado Volunteers to proceed with all possible dispatch to Fort Union, or Santa Fe, New Mexico, and report to General Canby for service."

"Two days thereafter the command marched out of Camp Weld two miles up the Platte River, and in due time encamped at Pueblo, on the Arkansas River. At this point further advices were received from Canby, stating that he had encountered the enemy at Valverde, ten miles north of Fort Craig, but, owing to the inefficiency of the newly-raised New Mexican volunteers, was compelled to retire. The Texans under Sibley marched up the Rio Grande, levying tribute upon the inhabitants for their support. The Colorado troops were urged to the greatest possible haste in reaching Fort Union, where they were to unite with such regular troops as could be concentrated at that post, and thus aid in saving the fort and its supplies from falling into Confederate hands. Early on the following morning the order was given to proceed to Union by forced marches, and it is doubtful if the same number of men ever marched a like distance in the same length of time."

"When the summit of Raton Pass was reached, another courier from Canby met the command, who informed Colonel Slough that the Texans had already captured Albuquerque and Santa Fe, with all the troops stationed at those places, together with the supplies stored there, and that they were then marching on Fort Union."

"Arriving at Red River about sundown, the regiment was drawn up in line and this information imparted to the men. The request was then made for all who were willing to undertake a forced march at night to step two paces to the front, when every man advanced to the new alignment. After a hasty supper the march was resumed, and at sunrise the next morning they reached Maxwell's Ranch on the Cimarron, having made sixty-four miles in less than twenty-four hours. At ten o'clock on the second night thereafter, the command entered Fort Union. It was there discovered that Colonel Paul, in charge of the post, had mined the fort, giving orders for the removal of the women and children, and was preparing to blow up all the supplies and march to Fort Garland or some other post to the northward, on the first approach of the Confederates."

"The troops remained at Union from the 13th to the 22d of March, when by order of Colonel Slough they proceeded in the direction of Santa Fe. The command consisted of the First Colorado Volunteers; two light Batteries, one commanded by Captain Ritter and the other by Captain Claflin; Ford's Company of Colorado Volunteers unattached; two companies of the Fifth Regular Infantry; and two companies of the Seventh United States Cavalry."

"This force encamped at Bernal Springs, where Colonel Slough determined to organize a detachment to enter Santa Fe by night with the view of surprising the enemy, spiking his guns, and after doing what other damage could be accomplished without bringing on a general action, falling back on the main body. The detachment chosen comprised sixty men each from Companies A, D, and E of the Colorado regiment, with Company F of the same mounted, and thirty-seven men each from the companies of Captains Ford and Howland, and of the Seventh Cavalry, the whole commanded by Major Chivington."

"At sundown on the 25th of March it reached Kosloskie's Ranch, where Major Chivington was informed that the enemy's pickets were in the vicinity. He went into camp at once, and about nine o'clock of the same evening sent out Lieutenant Nelson of the First Colorado with thirty men of Company F, who captured the Texan pickets while they were engaged in a game of cards at Pigeon's Ranch, and before daylight on the morning of the 26th, reported at camp with his prisoners! After breakfast, the Major, being apprised of the enemy's whereabouts, proceeded cautiously, keeping his advance well to the front. While passing near the summit of the hill, the officer in command of the advance met the Confederate advance consisting of a first lieutenant and thirty men, captured them without firing a gun, and returning met the main body and turned them over to the commanding officer. The Confederate lieutenant said that they had received no intimation of the advance from Fort Union, but themselves expected to be there four days later."

"Descending the Apache Canon for the distance of half a mile, Chivington's force observed the approaching Texans, about six hundred strong, with three pieces of artillery, who on discovering the Federals, halted, formed line and battery, and opened fire."

"Chivington drew up his cavalry as a reserve under cover, deployed Company D under Captain Downing to the right, and Companies A and E under Captains Wynkoop and Anthony to the left, directing them to ascend the mountain-side until they were above the elevation of the enemy's artillery and thus flank him, at the same time directing Captain Howland, he being the ranking cavalry officer, to closely observe the enemy, and when he retreated, without further orders to charge with the cavalry. This disposition of the troops proved wise and successful. The Texans soon broke battery and retreated down the canon a mile or more, but from some cause Captain Howland failed to charge as ordered, which enabled the Confederates to take up a new and strong position, where they formed battery, threw their supports well up the sides of the mountain, and again opened fire."

"Chivington dismounted Captains Howland and Lord with their regulars, leaving their horses in charge of every fourth man, and ordered them to join Captain Downing on the left, taking orders from him. Our skirmishers advanced, and, flanking the enemy's supports, drove them pell-mell down the mountain-side, when Captain Samuel Cook, with Company F, First Colorado, having been signalled by the Major, made as gallant and successful a charge through the canon, through the ranks of the Confederates and back, as was ever performed. Meanwhile, our infantry advanced rapidly; when the enemy commenced his retreat a second time, they were well ahead of him on the mountain-sides, and poured a galling fire into him, which thoroughly demoralized and broke him up, compelling the entire body to seek shelter among the rocks down the canon and in some cabins that stood by the wayside."

"After an hour spent in collecting the prisoners, and caring for the wounded, both Federal and Confederate, the latter having left in killed, wounded and prisoners a number equal to our whole force in the field, the first baptism by fire of our volunteers terminated. The victory was decided and complete. Night intervening, and there being no water in the canon, the little command fell back to Pigeon's Ranch, where a courier was dispatched to Colonel Slough, advising him of the engagement and its result and requesting him to bring forward the main command as rapidly as possible, as the enemy with all his forces had moved from Santa Fe toward Fort Union."

"After interring the dead and making a comfortable hospital for the wounded, on the afternoon of the 27th Chivington fell back to the Pecos River at Kosloskie's Ranch and encamped. On receiving the news from Apache Canon, Colonel Slough put his forces in motion, and at eleven o'clock at night of the 27th, joined Chivington at Kosloskie's."

"At daybreak on the 28th, the assembly was sounded, and the entire command resumed its march. Five miles out from their encampment Major Chivington, in command of a detachment composed of Companies A, B, H, and E of the First Colorado, and Captain Ford's Company unattached, with Captain Lewis' Company of the Fifth Regular Infantry, was ordered to take the Galisteo road, and by a detour through the mountains to gain the enemy's rear, if possible, at the west end of Apache Canon, while Slough advanced slowly with the main body to gain his front about the same time; thus devising an attack in front and rear."

"About ten o'clock, while making his way through the scrub pine and cedar brush in the mountains, Major Chivington and his command heard cannonading to their right, and were thereby apprised that Colonel Slough and his men had met the enemy. About twelve o'clock he arrived with his men on the summit of the mountain which overlooked the enemy's supply wagons, which had been left in the charge of a strong guard with one piece of artillery mounted on an elevation commanding the camp and the mouth of the canon. With great difficulty Chivington descended the precipitous mountains, charged, took, and spiked the gun, ran together the enemy's supply wagons of commissary, quartermaster, and ordnance stores, set them on fire, blew and burnt them up, bayonetted his mules in corral, took the guard prisoners and re-ascended the mountain, where about dark he was met by Lieutenant Cobb, aide-de-camp on Colonel Slough's staff, with the information that Slough and his men had been defeated and had fallen back to Kosloskie's. Upon the supposition that this information was correct, Chivington, under the guidance of a French Catholic Priest, in the intense darkness, with great difficulty made his way with his command through the mountains without a road or trail, and joined Colonel Slough about midnight."

"Meanwhile, after Chivington and his detachment had left in the morning, Colonel Slough with the main body proceeded up the canon, and arriving at Pigeon's Ranch, gave orders for the troops to stack arms in the road and to supply their canteens with water, as that would be the last opportunity before reaching the further end of Apache Canon. While thus supplying themselves with water and visiting the wounded in the hospital at Pigeon's Ranch, being entirely off their guard, they were suddenly startled by a courier from the advance column dashing down the road at full speed and informing them that the enemy was close at hand. Orders were immediately given to fall in and take arms, but before the order could be obeyed the enemy had formed battery and commenced shelling them. They formed as quickly as possible, the Colonel ordering Captain Downing with Company D, First Colorado Volunteers, to advance on the left, and Captain Kerber with Company I, First Colorado, to advance on the right. In the meantime Ritter and Claflin opened a return fire on the enemy with their batteries. Captain Downing advanced and fought desperately, meeting a largely superior force in point of numbers, until he was almost overpowered and surrounded; when, happily, Captain Wilder of Company G of the First Colorado, with a detachment of his command, came to his relief, and extricated him and that portion of his Company not already slaughtered. While on the opposite side, the right, Company I had advanced into an open space, feeling the enemy, and ambitious of capturing his battery, when they were surprised by a detachment which was concealed in an arroya, and which, when Kerber and his men were within forty feet of it, opened a galling fire upon them. Kerber lost heavily; Lieutenant Baker being wounded, fell back. In the meantime the enemy massed, and made five successive charges on our batteries, determined to capture them as they had captured Canby's at Valverde. At one time they were within forty yards of Slough's batteries, their slouch hats drawn down over their faces, and rushing on with deafening yells. It seemed inevitable that they would make the capture, when Captain Claflin gave the order to cease firing, and Captain Samuel Robbins with his Company K of the First Colorado, arose from the ground like ghosts, delivered a galling fire, charged bayonets, and on the double-quick put the rebels to flight."

'During the whole of this time the cavalry, under Captain Howland, were held in reserve, never moving except to fall back and keep out of danger, with the exception of Captain Cook's men, who dismounted and fought as infantry. From the opening of the battle to its close the odds were against Colonel Slough and his forces; the enemy being greatly superior in numbers, with a better armament of artillery, and equally well armed otherwise. But every inch of ground was stubbornly contested. In no instance did Slough's forces fall back until they were in danger of being flanked and surrounded, and for nine hours, without rest or refreshment, the battle raged incessantly. At one time Claflin gave orders to double-shot his guns, they being nothing but little brass howitzers, and he counted 'One, two, three, four,' until one of his own carriages capsized and fell down into the gulch; from which place Captain Samuel Robbins and his company, K, extricated it and saved it from falling into the enemy's hands."

"Having been compelled to give ground all day, Colonel Slough, between five and six o'clock in the afternoon, issued orders to retreat. About the same time General Sibley received information from the rear of the destruction of his supply trains, and ordered a flag of truce to be sent to Colonel Slough, which did not reach him, however, until he arrived at Koslowskie's. A truce was entered into until nine o'clock the next morning, which was afterward extended to twenty-four hours, and under which Sibley with his demoralized forces fell back to Santa Fe, laying that town under tribute to supply his forces."

"The 29th was spent in burying the dead, as well as those of the Confederates which they left on the field, and caring for the wounded. Orders were received from General Canby directing Colonel Slough to fall back to Fort Union, which so incensed him that while obeying the order he forwarded his resignation, and soon after left the command."

Captain E. D. Boyd.
(From a war-time photograph.)

Colonel Slough remained with the regiment until it reached Carnuel Pass on April 13th where his resignation was accepted. All the commissioned officers of the First Colorado, including Lieutenant Colonel Tappan, joined in asking General Canby to appoint Major Chivington to succeed Slough, which he did. Colonel Slough later went to Washington where he was made a Brigadier-General and Military Governor of the district of Alexandria. Slough was not, for some reason, popular with the men of his regiment. There are stories which say some of them had tried to shoot him during the fighting at Apache Canon. But their admiration for and devotion to Chivington were unbounded; he was their ideal of a dashing, fearless, fighting regimental leader.

This conflict, or series of conflicts, for there were several different engagements, which ended the Confederate invasion that actually occupied New Mexico and so seriously threatened Denver and Colorado, and which made General Sibley as anxious to get out of the country as he had theretofore been eager to get into it, is variously known in southwestern history as the battle of Apache Canon, of Pigeon's Ranche, and of La Glorieta. At this late day there is nothing to deter the reader from choosing either, as befits the fancy. It would seem, everything else being equal, that the latter, by reason of its euphony and its association with the locality rather than with people, is, of the three, best suited to the preservation by name of the historic and, in its consequences, most important, engagement between the Union and Confederate forces in the far southwest region during that tragic period of civil war.

Under orders from General Canby all available troops at Fort Union, including the Colorado men, left that post on the evening of April 5th and after eight days of rather trying marching came up with Canby's forces at Carnuel Pass, on the 13th. On the 14th Canby with his reinforced command started down the Rio Grande in pursuit of the retreating Confederates, who had previously evacuated Santa Fe and were trying to get back to Texas. Late at night on the 14th Canby overtook them at a place called Peralta where, on the 15th, there was some more fighting, but not of a serious character. However, while it was in progress, a detachment of the First Colorado was sent to capture a small force of Confederates that had become separated from the main command and had one piece of artillery with them. The Colorado men quickly made prisoners of every one of them, capturing their gun and everything else they had with them.

In the darkness of the night of the 15th Sibley slipped away, crossed to the opposite side of the Rio Grande and continued his retreat. Canby pursued without crossing the river with the expectation of being able to get ahead of the Confederates, and then cross and intercept them. So, in that fashion, the two bodies moved down the river most of the time in sight of each other. Sibley was so hard pressed that he had to burn his wagons and much other property, and load his supplies on pack-mules to make better time; and finally struck off into the mountains to evade his pursuers, with his forces much scattered.

Sibley had with him several small pieces of artillery—little brass howitzers about four feet long, that he had used at Apache Canon. In his retreat he found these were retarding him. So, when he was in the vicinity of Albuquerque he destroyed their carriages and buried the guns. In 1890, twenty-eight years afterward, with the aid of one of his surviving men, the burial-place of those little guns was located, the guns dug up, and now four of them are in the war relic museum here in our Capitol building; having been given to the State of Colorado by the United States, in 1898.

Canby proceeded on his way down the river and arrived at Fort Craig on April 22nd. There his men were given a rest, although they ran very short of provisions before the slow-moving trains came with fresh supplies. Leaving Chivington in command, at Fort Craig, of the district of southern New Mexico, General Canby and his staff soon afterward returned to Santa Fe. Early in July Chivington obtained relief from this duty and an order from Canby to proceed with his regiment to Fort Union. The march to that post was a long one, but the regiment was glad enough to get back there after that most active and extraordinary campaign which utterly destroyed Confederate hope for securing and maintaining a permanent foot-hold in New Mexico or Colorado. That first attempt of the southern forces to carry the war into the Rocky Mountain country was their last one, also.

In the military operations of General Canby and in those of his subordinate officers great embarrassment was entailed by their distant isolation, by the extreme difficulty and great delay in transmitting communications, and by the neglect, whether intentional or not, of the authorities at Washington. Of the latter, in the report of the Congressional Committee on the Conduct of the War, Colonel Roberts is recorded as having testified on July 15, 1862:

> "It appears to me to be the determination of General Thomas [Lorenzo Thomas, then Adjutant-General of the United States] not to acknowledge the services of the officers who saved the Territory of New Mexico; and the utter neglect of the Adjutant General's department for the last year to communicate in any way with the commanding officer of the Department of New Mexico, or to answer his urgent appeals for reinforcements, for money, and for other supplies, in connection with his repudiation of the services of all the army there, convinces me that he is not gratified at their loyalty, and their success in saving that Territory to the Union."

After the arrangements had been made for the First Colorado to proceed to Fort Union, Colonel Chivington, under leave of absence, came to Denver and then went to Washington to ask that he and his regiment be transferred to the Army of the Potomac. But, to his great disappointment, and that of his men, also, this change was denied him. Under date of October 11th orders came from the War Department that either the First Colorado, or the new Second Colorado, should be made a cavalry organization, the choice to rest with Governor Evans. The Governor decided that it should be the First, and on November 1, 1862, an order was issued for it to rendesvous in Colorado, with headquarters at Denver, preparatory to the reorganization.

After the regiment had reached Fort Union it had been broken into detachments which had been stationed at several places in New Mexico and southern Colorado. After much delay all of the companies were concentrated at Colorado City early in January, 1863, and marched thence to Denver where they arrived on the 13th of that month and received an enthusiastic welcome after their year's absence and hard and gallant service.

The change from infantry to cavalry was soon completed, and after that the regiment was again broken into several detachments which were stationed at different points here in the west, and as a unit it lost the identity that had won for it such renown. In this condition the regiment served until it was mustered out at the close of the war, its scattered detachments rendering in the meantime gallant and important services during the troubles with the Indians that began in Colorado in the summer of 1864.

Colonel Chivington developed extraordinary military ability. The victory at Apache Canon which sent General Sibley on his running retreat to Texas was Chivington's victory. He had no military training before he stepped from the pulpit to the battlefield. In action he was the incarnation of war. The bravest of the brave, a giant in stature, and a whirlwind in strife, he had that other faculty that makes soldiers personally love such a leader and eager to follow him into the jaws of death. Such a regiment as the First Colorado inspired by such a man as its leader, would have still further glorified itself could its field of action have been widened after the New Mexico campaign, as Colonel Chivington had hoped it might be.

In 1862 Colorado had been made a separate military district of this Department, and after Chivington returned from his failure to have his regiment transferred to the east, he was placed in command of the district. In this capacity he served until the close of 1864, taking charge in that year of the operations against the Indians that culminated in the "battle" of Sand Creek which, however justly or unjustly, clouded his fame and dimmed the lustre that his courage, ability and services had placed upon his name.

In the spring of 1862 two companies of Colorado Infantry had been organized independently at Denver, and intended for home defense rather than for general service in the field. The first one was officered by Joseph Ziegelmuller, Captain; Jacob Garres, First Lieutenant; William Wise, Second Lieutenant; August Kalishewsky, ensign. The second company by James M. Iddings, Captain; John A. Latta, First Lieutenant; Adamson T. Dayton, Second Lieutenant. When the Second Colorado was organized later in that year most of the men and some of the officers of these companies were included in that regiment.

The Second Regiment of Colorado Infantry was organized at Denver late in the summer of 1862. Its nucleus was the two companies recruited under Governor Gilpin's administration nearly a year before, and which were the first volunteer organizations authorized in Colorado. As we have stated, they had served gallantly under Captains T. H. Dodd and James H. Ford in the New Mexico campaign against Sibley, without having been permanently attached to any regiment. These companies were recruited principally in the Park, Lake, Summit, and Fremont counties of that time, and had returned to Fort Union after the New Mexico campaign. They remained on duty down there until the spring of 1863, when they joined the rest of the Second Colorado which by that time had been put into shape and transferred from Denver to Fort Lyon.

On February 12, 1862, Colonel Jesse H. Leavenworth, a son of Colonel Henry Leavenworth of the old army, for whom Fort Leavenworth, Kansas, was named, had been commissioned by the Secretary of War to organize in Colorado a regiment of infantry, to include the two companies above-mentioned and the other two that had been organized here. To these, six companies were to be recruited and added to form the Second Regiment of Colorado Volunteer Infantry. Leavenworth was delayed on duty at St. Louis and did not reach Denver until May 12th. He brought with him, manned by Wisconsin men, a six-gun battery captured at Fort Donelson, which gave his arrival a grimly military aspect.

Brigadier General James H. Ford.
(From a war-time photograph.)

In June additional officers for the proposed organization were appointed. They were T. H. Dodd, of one of the veteran companies above-mentioned, Lieutenant-Colonel; and Captains J. Nelson Smith, L. D. Rowell, William H. Green, George West, E. D. Boyd, and S. W. Wagoner for Companies E, F, G, H, I, and K, respectively. Later, James H. Ford, Captain of the other veteran company, was made Major. Headquarters were established at Camp Weld, but recruiting proceeded slowly. Large numbers of miners and other idle men left Colorado that summer for the new gold-fields in Montana and Idaho, and other large numbers had gone back to the States in that and the previous year. During that summer there were several bands of predatory Indians roaming the country, confining their operations to stealing, and several parties of the Second's recruits were sent after them before the companies were fully organized.

About the middle of August Leavenworth was ordered to move his men to Fort Lyon. The regiment left Camp Weld on August 22nd and made the march in seven days, arriving at Lyon on the 29th, a distance of two hundred and forty miles. The regiment remained at Fort Lyon until April 6, 1863, in the meantime being joined by the two companies from Fort Union, and having added to its numbers some men enlisted in southern Colorado for a New Mexico regiment. On April 6th six companies of the regiment left Fort Lyon, under Lieutenant-Colonel Dodd, to march to Fort Leavenworth; the rest of the regiment remaining at Fort Lyon for such duty in that region as might arise. When the six companies reached Fort Riley, Kansas, they were ordered to Fort Scott, Colonel Leavenworth and his staff having in the meantime gone to Fort Leavenworth. Colonel Leavenworth was placed in command at Fort Larned in July, 1863, of the troops on the Santa Fe trail, but charges were soon preferred against him, and he was dismissed from the service. He secured a re-instatement, and then immediately resigned; Lieutenant-Colonel Dodd succeeding him in command of the regiment, and the somewhat theatrical martinet, Leavenworth, passing out of view. The Second Colorado, or that part of it with Colonel Dodd, saw hard fighting service in the Indian Territory and Arkansas under General Blunt, in July and August of that year, participating in the battles of Cabin Creek, Honey Springs, and the recapture of Fort Smith, where we will leave them while we take up the initial history of the next Colorado regiment.

Early in the autumn of 1862 Governor Evans was authorized to recruit another regiment, of which General William Larimer was to be Colonel under instructions from Washington, and which was to be the Third Colorado Volunteer Infantry. The difficulties in filling the Second should have suggested those which attended and, to a great extent, negatived the Third. But the effort to complete the Third was undertaken in earnest. Recruiting offices were opened in Denver and elsewhere in the Territory. By December enough men had been enlisted to establish a camp at old Camp Weld which, for this occasion, was re-named Camp Elbert, in honor of S. H. Elbert, then Territorial Secretary; but through force of habit the old name persisted in sticking. S. S. Curtis had been appointed Lieutenant-Colonel and was placed in command of the camp. General Larimer, realizing the improbability of completing the regimental organization, had withdrawn his connection with it, and it was then understood that if the regiment should be filled, James H. Ford, then Major of the Second Regiment, at Fort Lyon, would be Colonel, with Jesse L. Pritchard as Major. But the regiment was not filled. By the 1st of February, 1863, enough men had been enlisted to complete five companies, which were mustered in on that day; Company A under Captain R. R. Harbour; B, under Captain E. W. Kingsbury; C, Captain E. P. Elmer; D, Captain G. W. Morton; E, Captain Thomas Moses, Jr. Company A came mostly from Summit county; B from Arapahoe and Boulder counties; C from Park and Lake; D from Gilpin; and E from Clear Creek. Orders had been received in January for the regiment, or such part of it as had been organized, to proceed to Fort Leavenworth without delay; but there was delay in several directions, principally in the matter of transportation for supplies and equipage. It was not until March 3rd that the five companies left camp and started on their long tramp to Fort Leavenworth, which they reached on April 23rd. On the 26th they embarked on a steamboat for St. Louis and went thence by rail to Sulphur Springs, a point twenty miles south of that city, where they went into camp for instruction. On May 21st they were ordered to Pilot Knob, Missouri, where they became part of the Army of the Frontier, although they had come from six hundred miles beyond the frontier. In June they were under orders to go to Vicksburg, but orders were changed, and the Third Colorado remained on post duty at Pilot Knob under General Clinton B. Fisk. Through that summer and autumn the Third did post and provost duty at Pilot Knob, Springfield and Rolla, Missouri, and continued it until December 7th, when it was ordered to Benton Barracks, St. Louis, to be consolidated with the Second Colorado, the two to be re-organized as a cavalry regiment. The several companies reached Benton Barracks on December 9th, later becoming Companies H, I, K, L, and M, of the Second Colorado Cavalry, the incomplete Third Colorado Infantry then passing out of existence.

Lieutenant Colonel Samuel S. Curtis.
(From a war-time photograph.)

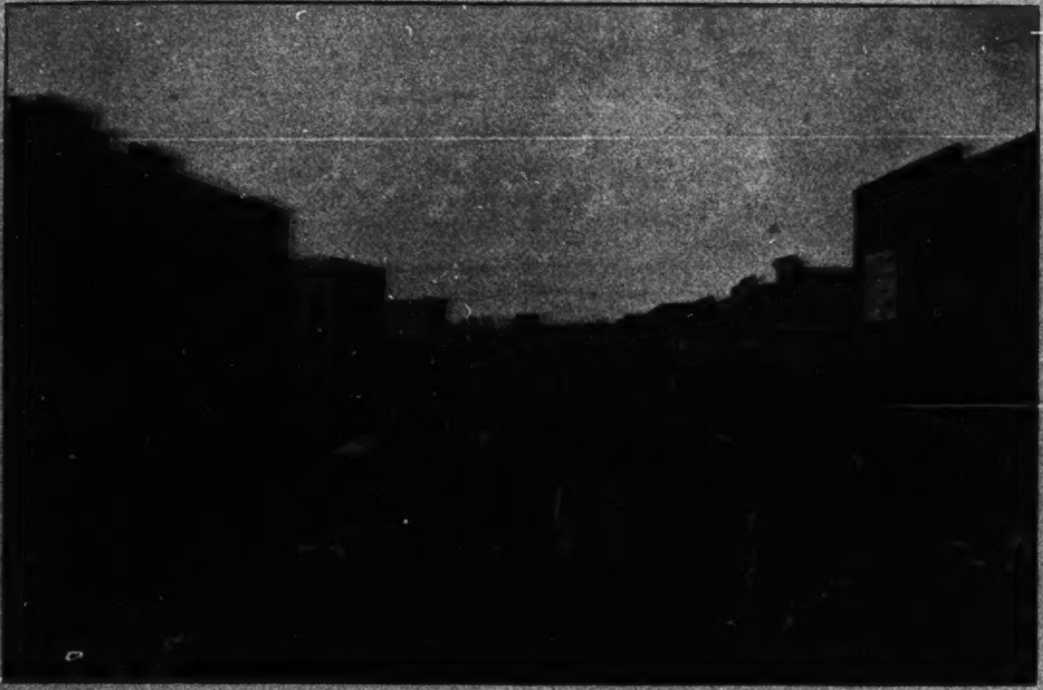
Of the circumstances leading up to his appointment as Lieutenant-Colonel of the Third Regiment, which he thinks unfortunately for himself terminated his citizenship in Colorado, Colonel Curtis has given us the following particulars:

"Governor Gilpin came as Governor of the Territory in May, 1861, and found me the only Federal official in the Territory; and being one of the oldest residents, I was consulted about almost everything he did, at first. I took the poll-books to Fairplay, Buckskin Joe, California Gulch and Spanish Bar for the first Territorial election. Governor Gilpin promised me a field officer's commission in the First Colorado Regiment, but having gone to Fort Laramie to get arms for the regiment, in which I was, after a great deal of delay, successful, I was not on hand when the regiment was organized, and so did not get the commission. Shortly after my return the Governor wanted me to go to Washington to get the 'Gilpin drafts' paid. I told him I had lost the field officer's position in the First Regiment by being absent, and that I thought I had better stay at home and look after my interests in a Second, if there should be one. He immediately offered and made me an appointment as Major of the Second Colorado, which appointment I held until I resigned it to Colonel Leavenworth on condition that he make Jim Ford Major in my place, which was done later. I went to Washington and splurged in the uniform of a Major of a regiment which had no existence except in the Governor's mind. In the fall of 1862 I gave it up, as stated, and went to the States where I secured an appointment as Lieutenant-Colonel and Aide-de-Camp of Missouri State Militia, which position I had held but a few weeks when I received notice from Governor Evans that he had authority to raise the Third Regiment, of which he offered me the Lieutenant-Colonelcy, which I gladly accepted, and of which Jim Ford was to be Colonel. I immediately returned to Colorado, took command of Camp Weld and of the recruits as they came in, organized and drilled them, and on March 3, 1863, started for the States with five companies who footed it to Leavenworth, with small-pox in the camp all the way, with a loss of but a single man. This ended my connection with Colorado, as a resident, and I am free to say that my going into the army and leaving Colorado was the mistake of my life."

The order for the consolidation of the two regiments was issued by Major General J. M. Schofield, commanding the Department of the Missouri, on October 11, 1863. Beside ordering the Third to Benton Barracks, it directed that part of the Second which we left with General Blunt, to proceed thither, also; and ordered the detachments of the Second that had been left behind in Colorado to go to Kansas City, together with about one hundred and fifty new men that had been recruited here. Later these detachments were sent to Benton Barracks where the new regiment was organized as the Second Colorado Cavalry.

James H. Ford who had become Major of the Second Infantry, had been appointed Colonel of the new regiment; T. H. Dodd, Lieutenant-Colonel; and S. S. Curtis, J. Nelson Smith, and Jesse L. Pritchard, Majors. The regiment consisted of twelve companies, and with the recruits above-mentioned, numbered 1,240 effective men. Late in January, 1864, it was ordered to Kansas City where it was finely mounted and equipped.

Colonel Ford, with headquarters at Kansas City, was placed in command of a district embracing several counties in western Missouri literally infested with Quantrell's, Hickman's, and Todd's guerrillas, two or three other regiments being added to his own, and all distributed in detachments over the district. Through that spring and summer Ford and his men were actively, sleeplessly engaged in that most fearful of all forms of warfare. In one of these engagements with bushwhackers on July 4th, Captain Wagoner with forty of his men were ambushed near Independence, he and nine of the men killed outright, and half of



View on Blake street, eastward from near Fourteenth, in 1865.
(From one of the Matthews sketches.)

the others wounded. His name as a pioneer citizen of Denver and a most popular man, is familiar to the reader who has followed us in our story. He and his men were buried in the cemetery at Independence, Missouri, where a monument bearing their names and marking their graves was in after years erected by Wagoner Post, G. A. R., of Independence. Captain Wagoner, or, as he was better known by the people of Denver in the pioneer days, Judge Wagoner, was only thirty-three years old when his life went out. In another and similar encounter Corporal Baer and eight men were surrounded and all killed, not one surrendering, nor asking for quarter, a thing neither given nor received in that kind of warfare. Of it, Captain E. L. Berthoud, of Colonel Ford's staff, from whose historical account of the Second Cavalry given in an address at the regiment's re-union at Golden in 1877, we have derived much of the data embodied in our account, said:

"Words can not do justice to the horrors of such warfare; nor can the tragedies which cruelty, violence, rapine, and the worst passions of civil war evoked in partisan warfare, ever be fully known. The worst passions had their full, unlicensed range, and in the lawless careers of the leaders of guerrilla bands, such as Todd, Quantrell, Anderson, and Vaughan, pity and humanity were unknown; slaughter, plunder, arson and murder followed ever in their van."

The Second Colorado Cavalry continued in that trying service through the summer of 1864, meeting with much, and constantly, of the hardest kind of guerrilla fighting, and suffering heavy losses. In the autumn, when General Sterling Price at the head of sixteen thousand Confederate veterans came into Missouri from Arkansas with the intention of sweeping all of the Union forces out of that State and of either occupying it or laying waste its towns and cities, including St. Louis, the Second Colorado Cavalry and McLain's First Colorado Battery were among the forces assembled to meet him. These Colorado organizations were in the thickest of the engagements that resulted in driving Price out of Missouri after having lost one-third of his army. The details of that memorable campaign, so important to the Union cause, belong to histories of broader scope than this one. In the battle on the Little Blue river near Independence the Second Colorado lost heavily and among its dead was Major Smith, shot through the heart. In all the subsequent engagements and until Price was pursued into Arkansas these Colorado organizations were in the worst of the fighting. At Newtonia, where Price made his last stand, the Second Colorado had forty-two men killed outright.

Befo[illegible] campaign was ended the plains were on fire by Indian warfare. In December, 1864, the Second Colorado was ordered to Fort Riley, and prepared for service against the Indians along the Arkansas up to Fort Lyon, as part of a large force that was to be organized and put in the field. The regiment was shifted from one point to another while these preparations were in progress in the spring of 1865, and had several minor engagements with Indians in which seven men were killed. But the proposed movement in force was ordered abandoned just when all preparations had been completed. Colonel Ford had been made a Brigadier General and placed in command of the Arkansas river district, and was to have had command of the contemplated army of five thousand or six thousand men against the Indians. When the movement was ordered abandoned he became so incensed that he resigned his command and left the service in which he had served so long and so efficiently. The Second Regiment continued in service until the autumn of 1865, but without any serious engagements with the Indians, though it was employed in hunting and chasing them all through that summer. In September it was ordered to Fort Leavenworth to be mustered out, and in October of that year the six hundred and seventy-three men—all that were left of the twelve hundred and forty of January, 1864—were mustered out, and became private citizens again. Nearly one half its members had disappeared; killed, dead by disease or disabled by wounds, in twenty-one months. These figures are far more eloquent than mere words in what they tell of the character and fighting quality of the Second Colorado Volunteer Cavalry.

In the autumn of 1862 William D. McLain, who had been prominent in the pioneer affairs of Denver, was commissioned a captain, to recruit and organize a four-gun independent battery of Colorado Artillery, which became commonly and proudly known as "McLain's Battery." At that time there were four guns at Camp Weld that had been sent here by General Canby from New Mexico for emergency use in Colorado; but no men to man them had been provided. McLain's battery was well equipped, was ordered to Missouri and participated in the military operations in that State. It was with the Second Colorado Cavalry in the engagements that almost destroyed the army of General Sterling Price, and in the reports of those battles are found such references to it as these: "well seconded by the First Colorado Battery;" "the rapid work of the First Colorado Battery compelled the retreat of Price's men;" "McLain's Colorado Battery hammered away;" "the First Colorado Battery was placed near the key of the whole position; the main brunt of the whole battle was here;" "The First Colorado pitched in regardless of numbers and of its cost." The battery was to have been in General Ford's expected movement against the Indians on the Arkansas in the spring of 1865, but soon after that enterprise was abandoned the battery was mustered out of service.

The Colorado volunteers were exceptionally able and willing fighting men. Most of them, by personal experience on the frontier and in the mining operations, had become inured to hardships and privations more severe than the usual accompaniments of army life; were familiar with the use of arms, and accustomed to the presence of personal danger in various forms. The percentage of men sent into the Union armies by the Territory was exceptionally high—between thirty and forty per cent more than the population's mere quota would have been under the several calls for troops. The percentage of losses by the Colorado organizations was also exceptionally high; the deaths in action and by disease, the wounded, missing, and prisoners, aggregating forty per cent of the total enlistments—a ratio not exceeded, and probably not equalled, by the losses of any other Territory, or State, that sent its citizen soldiers into the Union armies.

To their memory, and to that of their valorous deeds, there exists in Colorado not a monument; not a public memorial of any kind; not even an adequate record of their personalities and achievements. The State and the cities of the State are destitute of fitting evidences of public appreciation of the services they so freely gave and of the sacrifices they so nobly made: there is not one thing worthy of consideration.

CHAPTER XXXIX.

Period of Depression in Mining—Changed Character of the Work—Hegira of Autumn of 1860—1861 an Unsatisfactory Period—Adverse Conditions Through Several Ensuing Years—Era of "Speculative Mining"—Frauds and Abuses Attending It—Menacing Legislation Threatened in Congress—Continuation of "Speculative Mining," Its Consequences and Collapse—Conditions in Central City and Other Camps—Effect of Speculative Mania on Colorado and Denver—Solution of the Refractory Ore Problem.

In preceding pages we have, somewhat at length, recounted the circumstances attending what it would seem proper to term pioneer mining in the Denver region—the mining of the pan, the rocker, and the small sluice—and have mentioned the indications that appeared before the close of 1860, that mining of that kind could not and would not last very long. Those indications proved true ones, and the transition from the comparatively easy former conditions to difficulties and obstacles that seemed for a long while to be insurmountable, was made in much less time than the more conservative of the pioneers of 1859 had ever anticipated.

It is to consideration of these adverse circumstances and conditions which so soon beset the mining people, and which troubled and retarded them through most of the decade that followed 1860, that we will here invite the attention of our readers; leaving further accounts of mining progress and results to be embodied in the chapter devoted to statistical and other records of mining and its kindred interests that finds appropriate place nearer the closing pages of this volume. We feel warranted in taking up this part of the subject here for two reasons: one is that a history of Denver must include a great deal of the history of mining in these mountains near us, for it was that which brought the city into being; the other is that the obstacles and difficulties soon encountered by the miners, were chiefly responsible for checking the growth and development of the city to such an extent that the census of 1870 recorded only ten more inhabitants than the slovenly one of 1860 enumerated here.

While the spring of 1860 brought with it a renewal and an expansion of the enthusiasm that had prevailed among the gold-frantic inhabitants of "Jefferson Territory" the previous year, it also brought feelings and emotions of another kind to thousands of those who came into the country in droves in the second year of profitable gold-digging in the general region of Denver. The richness and probable great extent of the gold-fields were indisputable, but in their then ascertained limits there was not room for everybody in the multitude that was seeking working-places.

But the most sanguine expectations were nursed, and not without reason, for astonishing results had been attained the previous year when mining had been done under troublesome physical drawbacks. Now they were to have the benefit of experience, of new and improved appliances, cheaper provisions, regular communications, law and order, and many of the other advantages and facilities that come with established civilization. To a large portion of the people these hopeful anticipations of 1860 were fulfilled; to another and larger portion they were denied.

Early in the spring the old miners began coming in again and resuming work upon their claims, and the fresh recruits trooped after them. Of the conditions confronting these last-mentioned people, and of the experiences they encountered, Hollister says:

> "It is hardly necessary to say that the general aspect of affairs appeared gloomy and forbidding to them. All the known claims were of course occupied; and there was such an almost universal willingness to sell at good figures as to justly raise suspicions. There was but little else to do but to work by the day in the poorly secured lodes, or the deep, wet gulches, and wages were not much higher than in the States in proportion to the nature of the labor, and the expenses of living. It does not seem very strange, either, that the old settlers—who had been in the mines a year!—were somewhat cold toward the immigrants. They felt that they had earned what they had got, and that there was chance enough for others to do likewise. Surely, they said, all these strangers can not expect employment here on our ground; let them branch out and find mines for themselves, or if not, go back. So the dwellers in wagons, in tents, in booths, prospected—which is a discouraging business except to the prospector by nature, who must have the faith of a martyr—made continual purchases of claims which they knew not how to

work, gold washing being a nice business, and were obliged to throw up; cut saw-logs or cord-wood, or engage in such other work incident to mining, as the case admitted; or finally, laid around and consumed the grub they had brought with them. The whole district was full of tents and camp-wagons; it was over-run with people. A heavy snow storm about the first of May was also well calculated to dampen the spirits of the new men. The Consolidated Ditch had not been finished and water was scarce. Buildings, it is true, were springing up as if by magic, and operations were extending; 'big things' there were, too, in old and new discoveries;—one man in Russell Gulch rocked out ninety pennyweights in a day;—but wages were quite low; it seemed there were no more big things to strike; it was hard to get letters from home; and is it wonderful they felt discouraged! Still they poured in."

Placer mining had been a comparatively simple avocation the previous year, but now it was being conducted in many places on a scale relatively much larger, and requiring more capital. For the extensive operations inaugurated this year a series of long, trough-like boxes overlapping one another and from one to two feet in height and width, with quicksilver riffles on the bottom to catch the gold, with hose or some other hydraulic arrangement for washing down the gold-bearing dirt, constituted the material outfit for working in a large gulch. Plenty of water was necessary, and a large stream of it was kept flowing through the sluice-boxes, while the dirt or sand was washed or shoveled into them. The gold sunk to the riffles and was retained by the quicksilver lodged against them—and that is about all there was of it. The miners could "clean up" every evening if they chose, and know each night just what their rewards were. The bar and creek diggings were operated about the same way, except that the course of the stream was turned, and excavations made in its bed down to "bed rock." These had to be kept free of seepage water by constant pumping, and timbered and braced against caving, as they frequently went to considerable depths before bottom was reached where most of the gold was found. The bulk of it was as fine as powder, and in the course of ages had worked down through the gravel and sand. Some was in scales and nuggets, the latter ranging in size from that of a pea, to the very unusual dimensions of a hen's egg—a rare discovery in the miner's career.

Central City, looking up Spring Gulch, in 1865.

But the lode mining, after they got through with the disintegrated matter near the surface and struck into the hard rock in which the metal was so finely distributed as to be invisible to the unaided eye, was work of quite a different kind. Following the vein down into the bowels of the mountain, through granite and other rock that could only be penetrated by tedious hand-drilling, and blasting; solidly timbering the shafts and levels against accidents; keeping down with miserable appliances the water that would soon flood the workings; hoisting out the spoil, first by hand windlass, then as the hole went deeper, by horsepower, and finally by steam when the horse failed; crushing and otherwise treating the ore to recover the metal, constituted a complicated business evidently unsuited to amateur miners such as most of those were who dug for gold in this region in 1859 and 1860. As the ore came from increasing depths it became harder and harder to manage with the knowledge and means at hand; and this kept on until ultimately they found themselves pounding much of it without getting anything for their trouble.

1860 was the year of mushroom quartz mills. They literally crowded each other in the mining districts. For a considerable portion of them the trouble began that year, and some did not do a day's profitable work, for they could do nothing with the mineral; but their owners kept them thumping away through that summer for the sake of appearances and in cheerful disregard for adverse financial consequences. Others were more successful, and the one good thing that could be said about all of them was that they required a great deal of labor to keep them going, and in this season gave employment to many men who otherwise would have been idle.

There was a great plenty of stamp-mills and more coming. It is stated that up to the last of June, 1860, one hundred and sixty of these mills had left the Missouri river for the Pike's Peak country. Six arrived out here on the same day. On July 1st sixty of them were in operation, or thought they were, in the vicinity of the Gregory Diggings, alone; besides about thirty arastras, the latter doing by far the more successful work. Of the operations of the stamp-mills at this time a writer of the period says:

> "Somehow the mills as a general thing do not save the gold; why, it is hard to tell. There must be some difficulty beyond the mills—doubtless the want of experience in the men who run them. Crushing quartz is a new business to them; and it is a very nice one, requiring skill, and as all of us yet lack this skill, we fail in almost every attempt, just as any one does in a new vocation about which he knows nothing. Some of the mills have tried quartz from the Bates, and pronounced it worthless, while the arastras got two hundred dollars a cord from the same stuff."

Central City in 1865—looking up Gregory and Eureka Gulches.

But they were not all so bad. One mill in Nevada in its first run of eight hours produced three hundred and twenty-one dollars. In Eureka a ten-stamp mill in ten days produced four thousand, four hundred dollars. Another in Nevada took out nearly four thousand dollars in five and one-half days. An eighteen-stamp mill in four weeks had five thousand, two hundred and fifty dollars. These were notable exceptions, however.

When they struck pyrites their troubles began in earnest. The mills, or the processes used in connection with them, failed most dismally. Of the experience of one mill that had been theretofore recovering from fifteen hundred to two thousand dollars a week, Hollister relates:

> "A run of eighteen hours gave but one dollar and forty cents. They commenced experimenting. A pan of "tailings" (crushed ore as it came from the mill) was boiled in quicksilver. The amalgam therefrom yielded $9.70. The same material was exposed to the frost two nights, and boiled again in quicksilver, yielding this time, $4.80. The process was repeated with the following results: $3.67, $6.34, $2.78, $1.04, $1.06, $0.33, making a total of $29.67. Then it was seen that the stamp-mills were very deficient."

The Boulder News, in a historical sketch published more than a quarter of a century ago, relates the following which fairly illustrates the lack of technical knowledge among the miners who were blunderingly trying to get lode gold out of the stubborn rock in which it was concealed:

> "The crudeness of the art of saving gold in those days is well set out in the story yet told of D. D. White's experience. When he came in from the Missouri river, according to the custom of those days, he loaded with a stamp-mill and bacon, and to economize space filled the batteries of the mill with the fat bacon sides, utterly ignorant that grease and amalgamation do not agree. He started the mill with the batteries full of the fat, and after a run on rich ore, the clean-up, of course, showed not a trace of gold!"

But it is not to be understood that the ordinary placer mining of the previous year, that of the pan and small rocker, had ended. On the contrary it reached its greater proportions in 1860, and men were working in hundreds of places. Nevertheless its end was plainly in sight, and in the next year its decline set in, and it kept on fast declining, until now it is an almost unimportant occupation in Colorado. A few men here and there still do a little at it along Clear creek and its tributaries, and in Summit, Park, and Lake counties, but as a general mining proposition it is practically obsolete. In 1860 not more than one man out of a half-dozen who were on the ground could find a place to work, and by early autumn many of the stamp-mill owners and operators were so discouraged with the results, that instead of retaining their full forces of men they were reducing them, and a number of mills stopped work altogether before the season closed, adding their quota to the army of the unemployed.

These pioneer stamp-mills were crude, imperfect affairs, and even when handling the partly disintegrated quartz were not brilliantly successful, and some of them missed as much as they saved. But, as has been stated, when they got to dealing with material carrying pyrites, their previous troubles appeared small in comparison with the new ones that came upon them. Few of them could do anything with it, and most of them failed entirely. The gold was in the stuff they were working but the mills could not get hold of it.

Those which did get some had difficulty in obtaining from the greater bulk of the quartz they handled more than seven dollars a ton, which was barely the cost of crushing it. We have used herein the "ton" as the unit of ore quantities, but in Gilpin county ore was measured by the "cord," a practice followed nowhere else in Colorado at that time.

When the autumn of 1860 set in some of the scenes of the previous year were repeated. Thousands started back over the plains for the States discouraged, disgusted, or mad all the way through. Most of them loudly proclaimed the worthlessness of such a country for decent white men, while others plodded along in silence and with a dejected air, as if they had just been convicted of sin, and were on their way to receive punishment.

It was the old story over again. Droves of them had come out expecting to get rich before the snow began to fly, and seemingly without the faintest conception of what mining really meant, with all its drudging toil and slavish hardships. Half of them had been unable to locate claims, and they complained bitterly of the greediness of those who got in ahead of them and persisted in sticking to whatever they may have found. It is doubtful if any equal area in the world ever produced such a crop of disappointments, exultations, dejection, elation, bitterness of heart, enthusiasm, and other manifestations of human emotions, as that yielded within a radius of a hundred miles around Denver in 1859 and 1860. So, again there were lines of the weary and heavy-laden stringing homeward across the plains, lighter of pocket, but weighted at heart.

Black Hawk in 1866.

For the bitter disappointment of these well-meaning men the reasons were few but plain. Of the multitudes of 1860, as of those of 1859, not one in a hundred knew anything about mining, but most of them could if they could find a working place in which to dig, in a gulch, or bar, or creek-bed, slowly learn to wash out some of the placer gold; but the lode work and the mill work was an entirely different proposition. Many of the men who had invested their capital in stamp-mills which they brought here with them, did not know how to manage them or what to do with them when they got here and set them up. For most of both owners and employees Fossett says "it was like a plow-boy attempting to manufacture an intricate piece of machinery without having served a day as a mechanic." In later years the tailings and other wastage from these primitive mills were very profitably worked over by new processes.

There were no such streams of immigration in 1861 as in each of the preceding two years; nor were there ever again. But few people came to the Denver country that year. The eyes and thoughts and energies of the Nation were turned toward the Southern Confederacy. Yet Denver made some improvements that year and became a tidier town. Its society had been regenerated the year before by the well-applied methods of the People's Courts, and under the new and unquestionable Territorial government there was legally constituted authority in power. Nevertheless, there was a cry of "hard times" that echoed over against the mountains.

Some of the quartz mills were at work in the mining districts with somewhat better results, but most of them were still unable to make things go. The difficulty in treating the quartz had turned hundreds, thousands of men to placer mining, and the gulches and bars were delved into down to their foundations, with such vigor that this year may be said to have inaugurated the beginning of the end of general placer mining. The true condition of affairs was reflected in the low price of supplies. The best St. Louis flour sold—at a heavy loss—in Denver that summer for four dollars and fifty cents per hundred pounds. While provisions of all kinds were very cheap, labor was relatively cheaper, and employment was hard to find and harder to keep. Considered all in all 1861 was not a satisfactory year in Denver nor in the region around it.

Another effect of the impotency of the pioneer stamp mills, was apparent in 1861, in the great numbers of men running at large as prospectors. The country was full of them and no end of claims, some of them good, some bad, and some mighty indifferent, were staked off. As an indication of the extent to which this work was carried, it is stated that the Recorder of the Spanish Bar District, alone, made record in that year of twelve thousand lode claims, three hundred and three bar claims, and twenty-five gulch claims; besides three hundred water-mill sites.

By the close of 1861 the placer mines had been in a great measure well worked over, and lode mining was almost at a standstill in consequence of the failure of the then known methods and appliances for extracting the gold. A large proportion of the stamp-mills had given up the task in despair and were standing idle while their machinery rusted. Their workmen were sent adrift, and discouragement again brooded over Denver and the region roundabout. As if this were not enough, the southern States had seceded and the two sections of the Nation were engaged in war.

In 1862 mining conditions were somewhat improved, and crude processes had been developed so that a greater number of mills were working the mineral profitably, though still very wastefully. While they were saving thousands of dollars' worth each, weekly, and reviving confidence in lode mining, they were still turning thousands of dollars' worth of the metal into the streams along with their tailings. But upon the whole all the conditions were bettering. Placer mining was nearing its end, and it did practically end the following year. In the near vicinity of Denver it had almost died out by the close of 1860. In other parts of the country the bars and gulches had been worked over three or four times and about exhausted before the summer of 1863 drew to its close, and terminated what may be called the romantic era of gold mining in Colorado.

Through 1863 and 1864 the number of mills at work had further increased in consequence of the costly experience of their operators through which more effective methods of treating the ores had been reached, and with results that were much improved over those attained in 1862. Still the methods were extravagantly wasteful; so much so that ore from a majority of the mines around the mills would not yield the cost of milling, and there was no remedy at hand to prevent the loss. The depression in the business that had set in in earnest in 1861 was by this time somewhat alleviated, but there was still enough of it to keep down anything like buoyancy of feeling in Denver or in the mining camps; though it was by no means regarded as a hopeless situation. The difference between loss and profit for many mines was represented by the wastage of the mills resulting from their continued inability to get fair values from the material they were treating.

The United States Mint reports up to July 1, 1866, credited Colorado with a total gold production to that time of twelve and one-half millions of dollars. Much the larger proportion of this was produced during the three years, 1859, 1860, and 1861, which covered the era of general and profitable surface mining. The actual yield was in excess of the amount named above, the Mint reports not taking account of the considerable quantities long retained by miners, and that used in manufactures and in making personal ornaments—the latter calling for many thousands of dollars' worth. Some silver, copper and lead had also been produced, but they were regarded as by-products of no great importance. The silver-mining era was still in the future.

Mr. T. A. Rickard, Colorado State Geologist, in his important work "Stamp Milling of Gold Ores," (1897) thus refers to the discouraging difficulties the miners encountered during the decade we have under consideration.

Russell Gulch in 1860.

"The history of the evolution of the milling practice of Gilpin county forms one of the most interesting chapters in the record of the American mining industry. Briefly it was thus: The first machine introduced was the arastra, which at first proved satisfactory, but was soon found to be too slow for the American, however well suited to the Mexican. Stamp mills of three, four and six heads were erected by the Georgian miners, and these in turn gave place to larger plants modeled after the California fashion. This type—fast drop and shallow discharge—of battery was adapted to the treatment of the surface quartz. All went well; the output and importance of the district steadily increased. In July, 1860, sixty mills were at work in the county. The gold saving at that time was all done by riffles carrying quicksilver, but in the following year the first copper plates were introduced. Soon after this the camp received its first check; the oxidized material of the upper portions of the lodes began to give place to ore that was less quartzose, which contained more of the country rock as vein filling and carried a percentage of pyrites which steadily increased with depth. This was at levels varying from 100 to 200 feet. The mills which had previously been extracting from 60 per cent. to 75 per cent. of the gold contents gradually commenced to return only 50 per cent., 40 per cent., and then 30 per cent. None but the richest ore would now pay; the mills swallowed up two-thirds of the yield which should have rewarded the miner's toil; some of the mines were forced to shut down, while others had to confine their development to the narrower, richer portions of the lodes. Gilpin county as a mining field seemed to be about to write 'finis' across the portals of its mills and engine houses. At this juncture a small smelting establishment was erected in the district, and the metallurgist came to the rescue of the baffled mill-man. It was in the spring of 1867 when the Boston and Colorado Smelting Works were first established at Black Hawk. The Swansea process of copper smelting was introduced, the matte being shipped east. In the year which followed most of the mines remained idle; many of the mines were shut down, for only those could afford to be worked which yielded ore sufficiently rich to meet the cost of smelting. For some years the smelter took the place of the stamp mill, but in the interval the energetic, resourceful men of the place studied the successful treatment of their pyrites ores, and after experiments, which cost much time and more money, eventually in the beginning of the 'Seventies,' they solved one of the knottiest questions ever put to the miner."

"We are now familiar with the terms of 'free milling' and 'refractory' ore, and we are to some extent cognizant of the different treatment required by the two types, but such knowledge as we possess is in no small measure due to the plucky manner in which the millmen of that day overcame the obstacles presented by the treatment of a most difficult ore."

But the inefficiency of the mills was not responsible for all the troubles that confronted the mining people. The following from Hollister's "Mines of Colorado" describes some of the others which became common, and also gives some interesting history of operations on the famous Discovery Claims of John H. Gregory:

"In 1860 the east half of Discovery Claim [Gregory's] was leased to an association called 'The American Mining Company.' Forty feet from the surface they struck on the 'cap,' and instead of sinking a shaft through it, continued to work out the whole length of the mine. The 'cap,' properly speaking, was a narrowing of the vein, and not a complete capping over, or closing of it, as would seem to be implied. In Colorado, 'cap' has come to be almost synonymous with 'obstacle.' The quartz, or cap and wall rock, together paid them tolerably well for a few weeks. One day, upon cleaning up, their amalgam was very large and heavy, and they thought they had a 'big thing.' Retorting it, they discovered that their gold had escaped and that their mercury or 'quick,' had united with anything else than gold. What they had left would be hard to tell, only that it was not gold. This was the first experience of difficulty in amalgamating, caused by the presence of antimony, arsenic, galena, iron, copper, bismuth, sulphur, etc., in the gangue or vein-stone of the gold. Heretofore they had been operating on decomposed pyrites, quartz, dirt, gossan; now they had sunk further than water and other atmospheric elements had penetrated, the iron and copper pyrites were undecomposed, and for some reason, not to this day satisfactorily explained, their mercury would only unite with a small proportion of the gold. The mine soon ceased to pay for these men, consequently they failed to make their payments, and the original owners took the property back. It was then leased to another party on the same terms, and with the same result. The west half of No. Five and the east half of No. Six were then sold to Walter Lull. He soon found that he had bought an elephant, and gladly transferred his bargain to Lyon & Pullman. This firm also failed to make it pay, and the matter was compromised by the original owners again taking possession of the west half of No. Five. All this time the mine was in 'cap,' and was worked the entire length."

"Gridley finally sold his interest to Henderson. In June, 1862, Henderson put on a force, which worked night and day up to February, 1863, when the 'cap' was 'raised,' or pierced; in other words, the vein opened out again. The 'cap' was one hundred and thirty feet deep in one end of the mine, and one hundred and eighty in the other. During these last seven or eight months the rock taken out a little more than paid expenses, yielding eight or ten dollars a ton. From February to August, 1863, when the work ceased, to allow the erecting of a hoisting apparatus, sixty thousand dollars were taken out. A thirty-horse engine was set up, forty hands put on, and up to the close of 1863, twenty thousand dollars additional were taken out. Negotiations had then commenced for the sale of the property, in connection with others on the Gregory, to parties in the east, and in the succeeding spring it passed into the hands of the Consolidated Gregory Company, for the cash price of one thousand dollars per lineal foot, and a heavy consideration in the stock of the company."

The miner, Pullman, mentioned by Hollister, was George M. Pullman, who a few years later became noted as the designer of the sleeping-car bearing his name, and which brought him greater riches than he could ever have hoped to acquire by mining, even on the rich Gregory Lode. Pullman had partly designed his car, and received some patents on its appliances before he came out here.

But the lode-miners and the stamp-mill men were not having all the trouble nor all the trying experiences that demonstrated the uncertainty of mining in Colorado during those years. The business of unloading mines, ranging all the way from good ones down to the poor and worthless, on "parties in the east" who soon reaped a large harvest of tribulation, may be said to have begun with the year 1864, and immediately became one of amazing proportions. The excitement quickly rose to a fever heat, and was as great among the "parties in the east" who were putting their money into the schemes, as it was among the parties in the west who were providing the schemes and receiving the money. In addition to the thousands

View of Denver, from near present Intersection of Sherman and Sixteenth Avenues, in 1865.
(From one of the Matthews sketches.)

of claims that had been located in previous years, thousands of others on lodes, either real or suppostitious, all over the mountains around here, were staked off with the hope that they could be made either actual or speculative mines, whichever promised quickest and best results. In that year, 1864, the fees of the Recorder of one mining district amounted to twenty thousand dollars above all his office expenses.

In the spring of 1864 an episode in Congress startled both the speculative and the legitimate miners in Colorado and for a short time caused profound excitement and dismay among them. On April 21st Fernando Wood, then a New York member of the House, introduced a resolution providing for the government asserting absolute ownership and control of all mineral lands in Colorado and Arizona bearing the precious metals, and for the exclusion of free and unlimited mining operations upon them. Added to all the other troubles and perplexities the legitimate miners were having, this proposition seemed like the culmination of their afflictions, for it meant the striking down of the mining industry at one blow by the strong arm of the government. The preamble and resolution as printed in the Congressional Globe, April 22, 1864, was as follows:

"Whereas, the Government of the United States in succeeding to the sovereignty of the regions of country in which the mines of Colorado and Arizona are situated, became invested with a complete proprietary title to said mines; and whereas, no act of Congress has been passed alienating, or providing for the disposal of any part thereof, or prescribing measures for the use and working of them; and whereas, individuals and companies are assuming ownership and occupation, and are attempting to work, some of these mines, and are inducing the investment of capital in them by innocent parties: Therefore,

"Resolved, That the President of the United States be requested to take such measures as in his judgment may be necessary for the protection of the rights of the Government in the mineral lands and mines of Colorado and Arizona, until the proper legislation shall be provided by Congress."

In response to several requests from other members for a full explanation of the purposes of the resolution, Mr. Wood said:

"The object of the resolution is to protect some valuable interests which the Government possesses in the mines and mineral lands of Colorado and Arizona. At a time like the present, when all the great interests of the country are in jeopardy in consequence of the almost entire exhaustion of the positive, solid property of the nation, I think it is incumbent upon Congress and upon the Executive to protect all the property which the Government actually possesses.

I believe there are interests of the Government in these mines and in those mineral lands almost enough to pay the public debt. Now, sir, it is a well-known fact that companies are being organized every day in New York for the purpose of working these mineral lands. In fact, a mining board has been created for the purpose of disposing of this new mining stock. Those companies, as I stated, are created for the purpose ostensibly of working these mines belonging to the Federal Government, and innocent parties are induced to make investments in these speculative companies, thus absorbing a large amount of the capital of the country, and creating to some extent the stringency in the money market of which the Secretary of the Treasury now complains."

Upon being asked to explain how the President was to proceed and what he was to do Mr. Wood further said:

"In reply to the gentleman from Illinois who asks me what I propose the President shall do, I refer him to the language of the resolution itself. The resolution says that the President shall proceed in any way which his judgment may dictate to protect the interest of the Government in these mines and mineral lands. I assume that the President is clothed with ample power under the laws of Congress to protect the property of the country and the property of the Government. I do not propose that he shall involve himself in any serious difficulty or civil war in reference to the repossession of these lands; but I do say that when the Government is resorting to most extraordinary shifts for the purpose of replenishing its Treasury, when it is adopting a system of unprecedented and onerous taxation, when its expenditures are ten times its legitimate receipts, when it is straining its credit to the utmost extent, when it finds it necessary to deprive the States of the exclusive right of regulating their own private affairs through their monetary institutions; I say, under these circumstances, it is incumbent upon Congress and the Government to make available its positive and valuable resources. If a few men in the city of New York can absorb a capital of $50,000,000 in the creation of mining institutions, why cannot the Government throw into the market the right of working these mines? Why cannot it step in and say this is Government property, and not the property of Wall street speculators and individuals? And why cannot it make application of their immense values for the purpose of replenishing its exhausted Treasury? Before resorting to these extraordinary modes of taxation and to the extraordinary series of legislative acts proposed for our consideration, let us replenish the Treasury from these available resources, and cut down the Government expenditures fifty per cent., as in my judgment can be done without any detriment to the public service.

Therefore, without any consultation with any of my friends on this side of the House, but being in possession of a letter from Mr. Edmond, the Commissioner of the General Land Office, having some knowledge of the transactions of Wall street in reference to this question, believing that there are thousands of millions of Dollars in these mineral lands which belong to the Government, and believing that we should resort to every available means of raising a revenue, I have offered this resolution that the President of the United States may do that which, in his judgment, was best for the preservation of these rights and the protection of public property.

Nevadaville in 1865.

Hiram P. Bennet then represented Colorado as a Delegate in Congress, and instantly set about to defeat this proposition that, if carried into effect, would be absolutely destructive to the interests and development of his Territory. Though without a vote himself, he spoke vigorously against the measure, and otherwise opposed it with so much energy and ability that he marshalled votes enough to defeat it. Of course, Wood's plans for the government farming out mining rights, or operating mines on its own account, and getting the returns he anticipated, were purely visionary; but while the resolution was pending it threatened the Denver region with swift ruin, and caused the utmost alarm in the city and in the mining districts, adding materially to the depression that had already heavily clouded the prospects for successfully working the lode mines.

In 1865 Representative Julian, of Indiana, introduced a bill in Congress providing for a special survey of public lands bearing precious metals, and for their sale to the highest bidder above a minimum price to be fixed by the United States. This measure while it was pending was regarded with much apprehension by Colorado miners, but it failed to pass.

Mining companies were organized by hundreds in 1864 and the following year, all capitalized on the most extravagant basis, and many reaching into the millions. The company mentioned by Hollister, to which the two Gregory claims were transferred, had a "capital" of five million dollars, and several others had like amounts. The rage in the east for mining speculation and, with many, for intended permanent investment in mining, induced shrewd owners of mines and pretended mines out here to put them into huge corporations at bewildering prices. They were not slow in learning that it was easier to make a hundred thousand dollars or so by a single deal, consummated perhaps in a week or two, with the "parties in the east" who were as verdant as they were eager, than to worry with the rickety stamp mills that could save but little gold from the richest ore. Richardson relates that one of these corporations sold six hundred thousand dollars' worth of its inflated stock over the counter of its New York office in a single day.

From the initial operations of a few shrewd and not over-scrupulous men at the beginning of 1864, the infection spread far and wide over the mining region. Thousands who had been content with fair wages in the slowly-improving mining industry, left their places to become prospectors, speculators, and often swindlers. Legitimate mining was almost abandoned in the excitement over speculative and paper mining, and the true resources of the country were paralyzed. When one good or fairly good mine was sold to the misguided "parties from the east," a hundred other claims in the same locality would be put on the market, and successfully in the majority of instances.

Collusion between claim-owners who "inspected" each other's claims, "salted" lodes, bogus or misleading certificates, assays of ore of uncertain origin, were used to tempt and gratify the insatiable appetite of inexperienced people for sudden wealth. It was estimated that in about three years the amount of eastern capital invested in Colorado mines approximated the total output of all the diggings from the time of Gregory's discovery to the 1st of July, 1866, when the end of the speculative craze may be said to have come. Much the larger part of the vast sum became a hopelessly permanent investment.

Nearly all of the corporations had at once set about to develop and work their properties. Hundreds of expensive buildings were erected. Large quantities of costly machinery, much of it very inefficient, and still more of it utterly incapable and worthless, were sent out; and to its great first cost was added the enormous expense of freighting it here by wagons and putting it in place. Little of it ever did any work. The Clear creek gulches were crowded with mining structures containing all sorts of experimental machinery and untried appliances that never returned a dollar of the outlay they represented. Some of the buildings went to decay and tumbled down, and some were put to other uses. The machinery rusted away or was carried off piecemeal by marauders, and in 1867 the year after the total collapse of the craze not one company in ten was doing anything.

Of those in operation, nearly all were guiltless of dividends to their stockholders. Many of the finest mills were built by companies who were cheated in their mines, and found when they were ready to run that they had no gold ore to reduce. It was not then generally accepted that mining is a business by itself; and that reducing, or smelting, constitutes another business. Companies owning alleged mines thought that they must also have their own reduction works.

But with all their costly outfits, companies which had ore could not profitably manage it, as a rule. A few which had unusually rich material made a profit, but many who were handling ore running from one hundred to one hundred and fifty dollars to the ton were failing on it. Ore of such values would quickly make a miner rich nowadays. But many of the corporations were swindled and bankrupted by their management, which would seem to have had no practical ideas of the work and difficulties which had to be met and overcome. The companies had been promised early dividends by those who sold them their mines, and they rushed out their machinery and put up their buildings before they had developed their properties or had any proper preparation for getting out their ore. The results were delay, wasteful extravagance, and usually bankruptcy.

Idaho Springs in 1865.

As an indication of the methods they pursued, the fact that men made good wages panning out quicksilver from the tailings some of the mills turned into the gulches, is suggestive. Another is that a bunch of about twenty expensive mills did not have the equal of one good mine, put them all together. As a rule the affairs of these corporations were directed and managed by men sent here from the east for that purpose.

Most of the companies which had really good mines—and many had such, which, in after years yielded, and still yield, great riches—could not work them profitably under the then inadequate process of handling the refractory ores, and under their overloaded capitalization, ill-advised outlays and extravagant management. Of the conditions which ensued, A. K. McClure, who visited Central City in the summer of 1867, said:

Fall River in 1863.

"It was a painful spectacle to see miles after miles of abandoned mills standing as grim monuments to the folly of disappointed or ruined stockholders. Their owners have paid their millions of money without stint, and built up a continuous city along the gulch. Black Hawk City, Mountain City, and Central City, have no visible lines of separation. A single narrow street winds along the stream, with compactly built lines of houses on either side; and even in the midst of the general prostration and ruin which surround the cities, they are keeping up the semblance of business in the very depths of despair. They are waiting and struggling to live until the new order of things shall dawn upon them—until the dead corporations shall be decently buried, and stronger arms and practical minds shall drag forth the slumbering wealth. Missouri City stands in melancholy solitude upon the hill west of Central, with its tenantless houses, idle mills, and empty flumes; and Nevada City, winding off to the northwest, in continued decay, completes this colossal tomb of buried hopes."

"Think not that this gloomy picture is to be perpetual. This almost universal desolation is in the midst of enough gold to pay half our national debt. The mountain ranges along Clear Creek, and those westward to and beyond this place, are studded with gold. The gulches have all been dug over, and have well rewarded the heroes of the pan and spade. * * * * Georgetown has silver mines which, for vastness and richness, are hardly surpassed on the continent. Like the gold mines they are not yet mastered, but they will soon yield to the progress of science, and then must Colorado once more send forth her millions of treasure annually."

The following story which is quite characteristic of life, law and litigation in a new mining country, recounts some picturesque incidents of a squabble in the Clear creek district during the speculative period:

"A suit was pending between two rival companies, and the Chief Justice of the Territory granted an injunction restricting one from further work upon their shaft, but permitting Fitz John Porter, of army memory, who represented the other, to go on with his shaft. Angry at this seemingly unjust discrimination, the hostile company placed an injunction upon Porter, quite as effective and considerably more offensive. There was a draught from one excavation into the other; so, they built a fire upon their own premises, and Porter found a column of smoke from burning sulphur rising through his shaft, which made it impossible to enter it. An attachment was placed upon his opponents for this curious contempt of court; but they kept up the smoke. Both parties were bitter and armed with shotguns. The whole community was divided into adherents of one side or the other, and the contest involved much political feeling. With the usual frontier mildness threats of killing were freely made; but the affair was finally adjusted without bloodshed."

General Porter was the representative of the Gunnell Mining Company which was capitalized by "parties in the east," and owned very valuable claims on the Gunnell Lode, and which, before and after, produced large amounts of gold. The management was characteristic of that received by most of the properties owned by "parties in the east," and the following quotation from Fossett would, so far as reckless, wasteful, and fruitless expenditure went, apply to many mining corporations of that period:

"The first agent of the Gunnell Gold Company was General Fitz-John Porter. He received a salary of $15,000 per annum, and had a full staff of high-priced clerks and subalterns. A large stone mill was built in Black Hawk under his supervision, but its costly machinery, that came across the plains at enormous expense during the Indian blockade of 1864, was never set in motion. The only use the building was ever put to was as the depot and general freight warehouse of the Colorado Central Railway."

The suicidal speculative mania was of inestimable injury to Colorado and Denver. There is no fixing of responsibility for it, because it grew out of conditions and motives, both in the east and the west, from which human nature has not been able to divorce itself. But its disastrous results were followed by wide-spread and deep-seated aversions to Colorado mining enterprises; by sympathy they extended to the other natural resources of the country, and were not removed for many years.

While the physical evidences of the speculative craze, in the form of abandoned and decaying mills, and tons of obsolete, rusting machinery, were mostly over in the mountains, the consequences of the collapse were severe here in Denver. The young city was left floating on the waves of hope; she was discounting all her future prospects, and her misfortunes were grave, indeed. The useless rubbish of the decayed corporations had to be cleared away, the valuable mines rescued from the clutches of those which had acquired that kind, the obstacles in the way of reducing the ore had to be overcome, and mining placed in its proper, legitimate position, as a permanent, conservative business.

In the meantime many people came to Denver, stayed a while, and then went away again. The population fluctuated and much of it was forced to be of a transient character. If the balk in the mines was to continue, the prospect for Denver's future was not, and could not be made, an attractive one. So, hundreds went away, and when the census of 1870 was taken the result showed that Denver had made no permanent advancement in population. Thousands of men left the mining districts—owners, miners, laborers, and their hangers-on, and the mining towns were almost deserted when matters were at their worst.

During the earlier period of depression, and through that covering the speculative era, Denver waited in some doubt and with much hope often deferred, while the miners and mill-men groped around to find a remedy that would bring the refractory ores to terms. The speculative craze had benefited the few at the expense of the many, and at the expense of Colorado's reputation. Workmen were deprived of employment and investors were deprived of their money by speculative mining. In the meantime Denver had suffered a full share from the early reactionary effects of the civil war, and as that conflict had drawn toward its close the situation here had been aggravated by the impending danger of a general hostile uprising by the Indian tribes with which the city was literally surrounded.

The ores of one mining country are usually different from those of another, and those of Colorado were very much different from any theretofore encountered, presenting many new and puzzling difficulties. It was not until entirely new methods and processes were patiently worked out by tedious and expensive experiments that the obstacles were overcome. In solving the vitally important problems in which the future of Denver was immediately involved, the trained master-mind of Professor Nathaniel P. Hill led the way.

Empire City in 1865.

We are conscious of having dwelt upon pioneer mining at considerable length in these pages. Denver is so much the outgrowth of this industry that we have felt justified in doing so. Yet we have stated only the barest outlines of the story. Its history, as it should be recorded, remains unwritten, and awaits the attention of some one who will undertake the task with appreciation of its magnitude, and of the opportunities its elements offer for one of the most fascinating narratives in the annals of human efforts and achievements.

CHAPTER XL.

Indian Wars—Preparations of Tribes for Hostilities—Influence of the Civil War—Attempted Indian Confederation—Denver's Danger—Preparations for Defense—First Battle with Indians—Panic in Denver—Massacre of Hungate Family—Plains Region Aflame—Interrupted Transportation—Circumstances Leading to Battle of Sand Creek—Outlines and Consequences of that Frightful Affair—Colonel Chivington's Clouded Declining Years—His Subsequent Career and Death.

The pioneers of Denver and those of the country around it, had no great trouble with the plains Indians and but little with those of the mountains, in 1858, nor for several years afterward. With a few exceptions, the most serious of which was the affair of Dead Men's Gulch between the South Park and the San Juan country, the prospecting miners who swarmed over the mountain region were not molested nor held back by the red proprietors of the country; and from the time gold was discovered here until the general uprising began in the summer of 1864, the Colorado people, generally, were not menaced by them.

The local tribes of this vicinity manifested no hostility to the founders of Denver. They camped in and around the town, came and went at pleasure, and inspired no feelings among the whites above one of contemptuous toleration. Many of the braves became great loafers and beggars, with an inveterate fondness for whiskey. Away from Denver they hung around the stage stations and became positive nuisances because of their thefts of all sorts of odds and ends of things a stage station would afford. So, the white people gradually grew forgetful of or indifferent to the red man's power for mischief on the war-path, and thought of him only as a worthless vagabond beggar, thief and drunkard.

However, the Indian was not always let off so easily as that, and he had his story of wrongs and indignities suffered at the hands of the whites. He was often maltreated by brutal white men, and what he regarded as his rights were ruthlessly trampled under foot; he was robbed and cheated in trades in which he received little but the vilest compounds ever known by the name of whiskey; his country was invaded and occupied by the whites who killed or drove off the game that was about his only means of subsistence; and he was threatened with starvation if death by violence at the hands of the invaders did not sooner come. Here in Denver the Arapahoe Indians were sometimes the victims of most shameful outrages. Upon more than one occasion in 1859-60 their camps were invaded by half-drunk, but wholly brutal, white ruffians, who overpowered the braves and subjected the squaws to nameless indignities.

In the autumn of 1860, the Arapahoes and Cheyennes, under a treaty, ceded their lands here to the general government and departed from the locality with hearts filled with bitterness against the whites, and inspired by desire for revenge. These feelings at that time were general among the plains tribes and, by a common understanding, all of them quietly began preparing for the war-path. They realized their weakness without rifles and muskets, and devoted all their energy and shrewdness to procuring guns and ammunition. They would beg, steal, buy, or trade for them at every opportunity, and when they traded would give extravagant values. So perseveringly did they pursue this purpose, that by midsummer of 1862 nearly every warrior on the plains was armed, and supplied with ammunition.

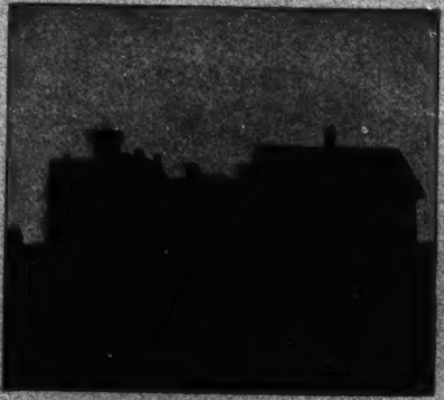
The war between the States was another great cause for stimulating them to united and aggressive action. Early versions among the plains Indians, of that conflict, were to the effect that the people of the Great Father at Washington had divided into two tribes or clans, and that all of them east of the Missouri river were fighting with such ferocity that both sides would surely be exterminated. As time went on and they learned more of the conflict's bloody progress their chieftains realized that the great opportunity for a union of the red people and an uprising that would exterminate or drive out all of the whites in the west, was at hand. They argued that as the whites east of the Missouri were fast annihilating each other, the comparatively few west of the river could, by the united power and valor of the plains tribes, soon be destroyed, and the entire country be again possessed by its rightful and aboriginal owners. This, briefly, is an outline of their conclusions and purposes. Some of the tribes favored an immediate confederation and an open declaration of exterminating war, but many others hesitated about it. Apparently they could not agree among themselves and get together on the proposition, notwithstanding that all of them were practically of one mind as to the existence of their opportunity and the certainty of their ability to crush the whites. Their failure to then unite in one grand campaign against the common enemy was probably due partly to the unpreparedness of some of the tribes, and partly to the jealousies and exigencies of Indian politics. But the determination of many of the Indians to begin war as early as possible was unchanged by the failure of general concerted action, and several tribes of the Sioux, acting independently, began the bloody work in Minnesota in 1862.

It is not within the scope of this work to undertake any general account of these Indian wars, and therefore we shall confine our narrative chiefly to events occurring in and near Denver while they were in progress. In 1862, the tribes in this part of the country, while they were and had been preparing for war, still professed friendship and a desire for peace. But Governor Evans was too shrewd a man to be deceived, and realized the danger that hung over Denver and the other Colorado towns and settlements, surrounded as they were by thousands of savages only awaiting an opportunity to attack and destroy. At that time the general government had all it could do in dealing with the armies of the southern States, and could give no attention to this isolated region. The Colorado troops were serving in New Mexico under General Canby, and in the event of an Indian outbreak the people here were destitute of organized means of defense.

Therefore, on July 18, 1862, Governor Evans, in a message to the Territorial Legislature, recommended the enactment of a law authorizing the enrollment of militia. The Legislature complied and passed a bill to that effect. The situation continued to grow more menacing, and in September, Secretary S. H. Elbert, then acting Governor, by proclamation recommended the organization of militia companies under the new law. Prior to these events Colorado had been made a Military District of the western Department, and placed under command of Colonel Chivington.

In October, 1862, several stations on the Santa Fe stage route were raided by Indians who ran off all the horses and mules they could find, and captured considerable other property of use to them in their meditated warfare, but did not attack any of the stage company's employees. After this there were no further depredations until the following spring when, on March 30th, a similar raid with like results was made on the settlers along the Cache-a-la-Poudre river. The Indians were not yet ready to begin killing, and continued their raids through 1863 wherever there was a chance of getting a horse, mule or gun. Stage companies, freighters and emigrants alike suffered from these systematic depredations. The Indians had also received arms and a considerable number of horses from Mexicans in New Mexico, and it was alleged that encouragement and material aid were given them by the Confederate authorities.

Repeatedly in 1863 Governor Evans communicated to the government at Washington unmistakable evidence of a contemplated uprising of the Indians on the plains—one that would become general, even if the tribes did not act under a confederated system; and urging immediate action for protection of the routes of travel, and the people here in Colorado. The correspondence with its accompanying documents became voluminous, but the general government was powerless to extend the needed protection. One of these documents was the statement of a trader, made early in November, who said the outbreak would occur early in the following spring, by which time the Indians would all be armed and equipped. He further stated:



West side of Fourteenth street from near Lawrence, in 1864. The middle building was Governor Evans' residence.

> "I heard them discuss the matter often, and the few who opposed it were forced to be quiet, and were really in danger of the loss of their lives. I saw the principal chiefs [Sioux, Comanche, northern Arapahoe, Cheyennes, Apaches, and Kiowas] pledge to each other that they would shake hands with, and be friendly to the whites until they procured ammunition and guns, so as to be ready when they strike. Plundering to get means has already commenced, and the plan is to commence the war at several points in the sparse settlements early in the spring. They wanted me to join them in the war, saying they would take a great many white women and children, and get a heap of property, blankets, etc."

Early in 1864 the Governor appealed to the Indian Agents to use every effort to avert the threatened outbreak, and asked them to keep him advised of every event having possible relation to it. General S. R. Curtis, of the United States army, and then commanding this department, was asked to send troops here, but he had none to spare. The Governor then tried the commanding officer in New Mexico and was again disappointed; whereupon he applied to the War Department at Washington for authority to enlist one regiment of volunteer cavalry to serve one hundred days which, after some delay, was granted him.

The storm broke early in May, 1864, over the great plains between Denver and the outposts of civilization in Kansas and Nebraska, and soon afterward the first movement against hostile Indians in this part of the country was made by Major Jacob Downing, then and now a citizen of Denver. With a company of the First Colorado regiment of cavalry he set forth to attack hostiles wherever he might find them. At Cedar canon, about 140 miles down the Platte from Denver he came upon a large war-party. After a hard fight the Indians were routed with a loss of thirty-eight killed and many more wounded. Their village was destroyed, and several hundred ponies captured.

During the first week in June a panic was caused in Denver by what were afterward learned to be erroneous reports that large bodies of Indians were moving upon the city from the east and north with the intention of inaugurating the war in this section by a general massacre of the people of Denver and the sacking and burning of the buildings. For a while many persons were frantic with fear and apprehension. Governor Evans issued an order directing that all business houses close at half-past six o'clock in the evening, and ordered all able-bodied men to assemble daily at Larimer and Fourteenth streets for drill in the manual of arms. One evening it was reported that the Indians were but a few miles from the city and that an attack would probably be made during the night. Women and children to the number of five hundred were taken from their homes to brick business houses in the central part of the city which had succeeded those burned in the fire of the previous year, for greater safety. The "Mint" building, the old "Arsenal" in "West Denver," saloons, billiard rooms, as well as store-rooms, were converted into places of refuge for the distracted non-combatants, who passed a night of extreme mental and physical discomfort, but were rejoiced next day to learn that the immediate cause of the panic was groundless.

But in the meantime, aside from the improvised companies of citizens, the Governor's Guards were called out, block-houses and other defenses thrown up in the outskirts of the town, and pickets stationed all around it. In building the defenses the logs of many of the pioneer cabins that had survived served good purpose, as the Indians would have learned had they made their appearance for attack.

Henry M. Teller had been put at the head of the improvised Territorial militia by Governor Evans, with the rank of Major-General. On June 17th he took command and began the work of properly organizing it for the public defense. The next day, June 18th, tidings came to Denver of the massacre of a man named Hungate, his wife and children, almost within sight of the city. Hungate had a ranche on Running creek, about twenty-five miles east of Denver, which had been attacked by the Cheyenne chief Roman Nose and his band, the inmates all killed, the stock and other useful property taken, and the buildings burned. Roman Nose for years and almost up to the outbreak of hostilities had professed the greatest and most enduring friendship for the white people, and had but a few months before assured Governor Evans that he was and always would be the firm friend of the whites.

The bodies of the massacred family were brought to Denver, and hundreds of people looked upon the scalped and otherwise shockingly mutilated corpses. The ferocious cruelty of Indian warfare was brought home to our people as it never had been before. Governor Evans at once placed the city under martial law, and thorough organization for its defense went on with renewed vigor. Martial law practically prevailed in the city all that summer.

No other massacres in the general vicinity of Denver occurred for several weeks, but by the beginning of autumn the whole plains region was aflame. The outbreak extended from New Mexico and Texas to British Columbia, and from the Missouri river to the Rocky Mountains. The pent-up love of killing, stimulated by the fires of hate, was impelling the Indians to every form of cruelty and devastation, and they were ravaging the country. For three hundred miles west of the Big Sandy in Kansas every building had been burned, all the movable property taken, and about eighty of the settlers massacred. Travel across the plains was interrupted, and all the necessaries of life advanced to high prices in Denver, with prospects of exhaustion and consequent famine. No life was safe on the plains even ten miles from the city, for the marauding bands were scouting everywhere. In the meantime the government, in the throes of civil war, was helpless to help, and could only say to the people of the Far West: "You must help and protect yourselves."

To the discredit of human nature it is to be recorded that in the midst of these dangers and troubles a little clique of men pooled their resources and bought up a large part of the flour and provisions in Denver and held them for high prices. Transportation over the plains being nearly at a stand, the greatly advanced prices that ensued were partly due to this clique's operations which brought them large profits; flour being doled out at thirty-two dollars for a hundred pounds, and other things in proportion.

Early in August Governor Evans had sent messages to certain bands thought to be peaceable, apprising them of the war and directing all who intended remaining friendly to repair to either Fort Laramie, Lyon, Larned or Camp Collins where they would be protected; and warning them that unrelenting warfare would be waged against all hostile bands. But this availed little for nearly all the Indians were either sullen, or openly at war. Then Governor Evans by proclamation authorized "all citizens of Colorado, whether organized or individually, to go in pursuit of the hostiles and to kill and destroy them wherever found, and to capture and hold to their private use and benefit all the property they could take." He expressed his belief that the United States would pay them for their services, but stated that the Territory of Colorado was unable to do so. He further said: "Any man who kills a hostile Indian is a patriot, but there are Indians who are friendly, and to kill one of these will involve us in greater difficulties. It is important, therefore, to fight only the hostile, and no one has been or will be restrained from this."

Indian Council Party halted in front of Governor Evans' residence, in September, 1864.

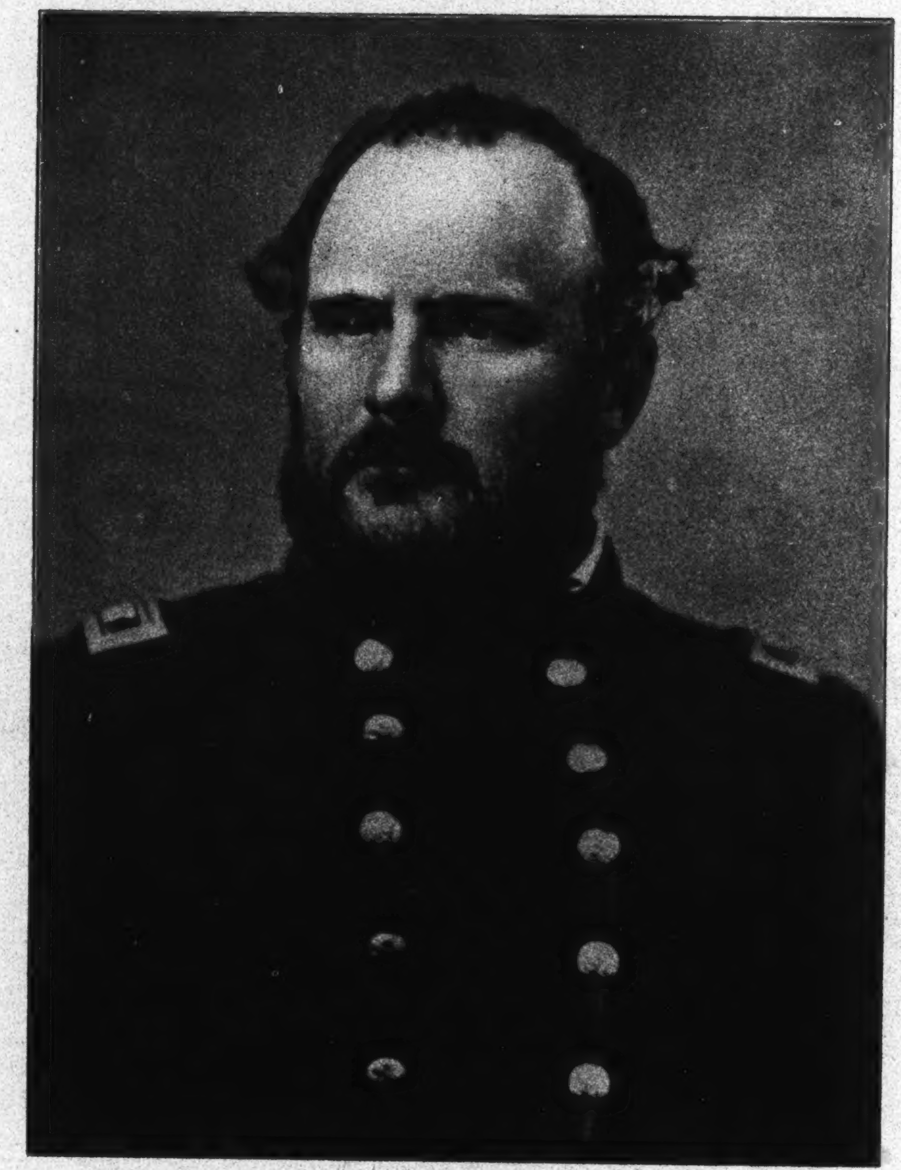
This was applying to the Indians their own method of warfare, with their inhuman cruelties left out, and the result of it was that many men went on the war-path after the Indian fashion, and stimulated to it by the prospect of capturing for their own use and benefit some of the property the savages had plundered from their victims. As there were "prairie schooners" on the plains in times of peace, it was befitting that there should be "privateers" on them in these times of the most cruel of wars.

Toward the close of August, Black Kettle, at the head of a large party of Cheyennes encamped down on the Arkansas river not far from Fort Lyon, proposed to Major E. W. Wynkoop, commander of that post, to make peace and to give up some white women and children his band had made prisoners, in exchange for Indian prisoners he pretended to believe were held in Denver by the white people, though the latter had none. His proposal had several insolent conditions attached, one of which was that the peace should also include the Kiowas, Arapahoes, and several other tribes of his friends which were then ravaging the country between Denver and the eastward border. Wynkoop went to Black Kettle's camp and arranged with that chief and several others to come to Denver for a talk with Governor Evans, under pledge of protection and safe return to their villages. Black Kettle surrendered to Wynkoop four white prisoners, women and children, his band had taken several weeks before. The fifth, a Mrs. Snyder, had killed herself rather than further endure the misery of her captivity. Three others, in possession of another band camped at some distance, were to be surrendered later.

Black Kettle; his brother, White Antelope; and Bull Bear, of the Cheyennes; and Neva and Bosse, of Left Hand's band of Arapahoes; came to Denver with Major Wynkoop, as agreed upon, and a council was held at Camp Weld on the 28th of September. Beside Major Wynkoop there were present Governor Evans, Colonel George L. Shoup, Colonel John M. Chivington, Simeon Whitely, United States Indian Agent; several citizens of Denver, and interpreter John S. Smith, our old trader friend who had helped in founding the city.

The council resulted in no practical good. Black Kettle harangued the assemblage, reciting the grievances of his people, making no denial of their participation in recent maraudings which he claimed were the work of the impetuous and uncontrollable young men who would not heed the wiser counsels of their elders, and giving no assurances of better conduct in the future. He was followed by Bull Bear who was more boastful than penitent, but who claimed that the plan to drive all the white people out of the country originated with the Sioux. Governor Evans then talked to the chiefs, reminding them of his desire and endeavors for peace, and warning them of the certain consequences of further warfare. The Governor was followed by Colonel Chivington in a brief speech which was both a warning and a threat. Then the council broke up without having agreed upon any policy for the future, and the Indians went back to their camps.

Governor Evans had no authority except that of the public welfare in an emergency, to make peace; and when General Curtis, then Commander of this Department, was informed of this council, he notified the Governor who had reported the meeting to Major Colley, the Agent for the Cheyennes and Arapahoes, that peace was not to be made with the Indians here without his instructions. In this report to Colley the Governor had stated that the council was chiefly for the purpose



John M. Chivington.
(From a war-time photograph.)

of learning, if possible, the intentions of the Indians for the future, and not for the purpose of making a treaty with them, or offering them anything, lest such a proceeding might embarrass United States military operations against the other hostile tribes of the plains. Soon after this, Governor Evans went to Washington on public business and remained there through the following winter.

The cavalry regiment of one hundred days men which Governor Evans had been authorized by the Secretary of War to organize for emergency service against the Indians—the Third Colorado—had been recruited in the summer, and at this time was lying at Camp Weld waiting for equipments and horses. George L. Shoup formerly a company officer in the First Colorado, had been appointed to command the new regiment, which was growing exceedingly anxious for active service, as nearly one-third of its enlistment period had elapsed in camp idleness.

Colonel Chivington, in command of the United States Military District of Colorado, had resolved to organize an expedition for operations against hostile Indians wherever they could be found in the Territory, and when found, to strike them a blow they would never forget. Chivington was a fine example of the preacher militant. More than six feet in height, of large frame, and otherwise of magnificent physique, with mental powers and inclinations befitting his physical equipment, he was well-designed for a leader of men in warfare. Upon the outbreak of the rebellion he ardently espoused the Union cause, assisted in recruiting and organizing the First Colorado Regiment, of which he was appointed Major, and with which he participated in the stirring campaign of 1862 in New Mexico, as we have already seen.

Horses, arms and equipments for the Third Regiment arrived at Camp Weld about the first of October, and late in that month the command, 650 strong, left the camp and moved to a point on Bijou creek near the summit of the "divide," where a halt was made and the regiment again went into camp.

About the middle of November it was learned that Black Kettle's band of Cheyennes, and Left Hand's band of Arapahoes, were camped on Sand creek, about forty miles northeast of Fort Lyon; one hundred and fifty lodges of them; in all some eight or nine hundred men, women and children. These bands were assumed to be hostile; at all events it was understood that they were not inclined to seek the protection of Fort Lyon which was open to them if they were disposed to be friendly; and they knew that all Indians who refused to avail themselves of such protection would be considered as hostile and treated accordingly.

On November 24th the Third Regiment, having been reinforced by a battalion of the First Colorado Cavalry, the whole under the command of Chivington, left the Bijou and started for Fort Lyon, about one hundred miles southeast. Proceeding to the Arkansas, the command moved down the left bank of that river to the Fort where it arrived on the morning of November 28th. There it was joined by one hundred and twenty-five men with two small pieces of artillery, under Major Scott J. Anthony, and on the same day set out for the Indians' encampment, marching all night, and reaching it before daylight on the morning of the 29th.

Colonel Chivington had kept the object of his expedition to himself until he came up with the Indians. He then ordered an attack by his entire force at daylight. Surrounding the village and cutting off the Indians' horses, without which they could make little successful resistance, the bloody work was begun as soon as it was light enough to see. The Indians were completely surprised and overwhelmingly outnumbered in fighting men. Then ensued a sickening slaughter. They were shot down without mercy or discrimination—men, women and children. The topography of the place made their camp a trap from which but a portion succeeded in escaping. Chivington had ordered that no prisoners be taken and that all should be killed. The soldiers obeyed him and the slaughter went on throughout the day, until there were none left to kill. Black Kettle and a part of his people succeeded in breaking through the lines of their assailants, but the rest, between five hundred and six hundred, and including Left Hand and White Antelope, were remorselessly destroyed and their bodies left as food for the wolves. Left Hand was shot down as he advanced holding up both hands with the palms outward—the Indian gesture-sign of peaceable intentions. The terrified children and some of the squaws huddled in large groups which at once became the targets for many guns, and the wretched creatures were shot down in heaps. After all were dead many were scalped, the occasional wounded—in some instances women and children—having been dispatched, as they were found, where they lay. All the circumstances of the affair, the further details of which are too revolting to be narrated here, were attended by a savagery almost equal to that charged upon Indians in their most murderous warfare.

A large quantity of plunder taken from white settlers, immigrants and freighters, and many scalps of white men, women and children—some but recently torn from the heads of victims—were found in the lodges, affording unmistakable evidence that these Indians, or a portion of them, had been engaged in the depredations that were setting the whole frontier aflame.

Chivington's loss was eight killed and forty wounded; two of the latter dying of their injuries a few days later. Sending his dead and wounded

to Fort Lyon, Chivington set out toward the Arkansas river on December 3rd to hunt for a band of Cheyennes and Arapahoes under the Arapahoe chief Little Raven, which was also in that region. Failing to find Little Raven after two days and nights of marching, his supplies running short, and the time of the Third's enlistment being near its close, Chivington started back to Denver, which he reached on December 22nd; and the Third Regiment was at once mustered out of service.

A cry of horror went up from all this land when the details of the "battle" of Sand creek became known, notwithstanding that the attention of the country had been fixed on the great preparations and operations destined to finally overcome the tremendous war of the rebellion. Colonel Chivington and his men were denounced throughout the northern States as fiends incarnate; as more savage than the worst of savages; as reproaches to civilization and as disgraces to the names and forms of men. Congress took notice of the public indignation, and the affair was investigated the next year by a Board of Inquiry sitting at Fort Lyon, its reports making voluminous documents. The evidence taken was contradictory as to details, but not as to the main points. An attempt was made to show that the Indians had quit the war-path and were preparing to go to Fort Lyon to avail themselves of the protection promised by Governor Evans earlier in the year to all tribes and bands which would repair to the military posts, give up their arms, and refrain from participation in the then impending uprising; and, therefore, they were, practically, under that protection, notwithstanding that they were not at Fort Lyon. However, this view of the case was not sustained, as the presence in the Indian lodges of many freshly-taken scalps of white people and of much plunder from massacred settlers and immigrants, wholly discredited it. These Indians appear to have hovered near Fort Lyon in order that they might, in an emergency, claim and seek its protection while, in the meantime, they permitted war-parties of their young men to make raids across to the Smoky Hill and the Platte. Their feeble resistance, and the slight loss inflicted on Chivington's command seemed to indicate that they were without many effective arms, and unprepared for battle with a large force. Their destroyers found no great number of good weapons in the wrecked village after the slaughter was over.

We can not undertake in this volume anything like a review of the Sand creek tragedy in detail. The affair has a copious literature of its own

---

Major Jacob Downing, whose name and services as a commander are so intimately associated with the defense of pioneer Colorado against invasion by the Confederate forces, and with the later operations against the Indians on these plains, was born in Albany, N. Y., April 12, 1830. After a thorough English education at the Albany Academy, he became a clerk in the City Bank of Albany, of which Erastus Corning was President, and so continued until 1850 when, with his parents, he removed to Cleveland, Ohio. After several years of travel in the west he located in Chicago in 1855, where he studied law. In the spring of 1860 he came from Chicago to Colorado and temporarily cast his fortunes with Mountain City—later merged into Central City.

Late in the summer of 1860 Major Downing removed to Denver, and has been a citizen here since that time. He participated in organizing the Provisional City Government in the autumn of 1860, and in 1861 recruited and organized a company, of which he became Captain, for the First Regiment Colorado Infantry which was later made a cavalry regiment. For his brilliant services and conspicuous gallantry in the campaign and battles in New Mexico that drove Gen. Sibley out of that Territory, he was made a Major of cavalry. So much of his services is involved in our accounts of the operations against the Confederates and later against the Indians, that it would be a needless repetition to outline them here. After the New Mexico campaign Major Downing was placed in command of the important frontier post, Fort Larned, Kansas, where he successfully protected 240 miles of stage-coach and emigrant route against the Indians with but 150 men at his command. For these services and for his management of the Indian tribes in that part of the country he was complimented by the Commanding General of the Department. He next became Assistant Inspector General for the Department, with nearly a dozen western military posts and camps under his jurisdiction.

Major Downing remained on that duty until the outbreak of the Indian troubles in 1864, when he entered upon his distinguished services in the Indian campaign. With a small force he fought the battle of Cedar Canon where, though outnumbered three or four to one by the Indians, he defeated them by the first serious blow struck them in this part of the western country. Returning to Denver with his command, he led one of the columns of Colonel Chivington's expedition against the Cheyennes and Arapahoes at Sand creek.

Mustered out of the service in December, 1864, Major Downing returned to civil life in Denver. In 1867 he was elected Probate Judge of Arapahoe county, and upon expiration of his term engaged in dealing in real estate, and in farming and stock-raising. But in that period, as elsewhere narrated, he was called upon to organize defense of the city against the last two menacing outbreaks of the plains Indians. Having acquired near Green Mountain, five miles west of Denver, a fine ranche of 2,000 acres, he has long been one of the most extensive stock-raisers in the State. It was he, in 1862, who introduced alfalfa in Colorado.

On November 1, 1871, Major Downing married Miss Caroline Rosecrans, of Saratoga, N. Y.; a descendant of an old and distinguished Revolutionary family—J. C. S.

which, if brought together, would make a volume as large as this one, though much the greater part of the text would consist of justification on one hand and denunciation on the other, of this the most shocking event in the history of the Territory and State. Furthermore, we do not regard it as essential that the right or the wrong; the justification or the savage wantonness; the criminality or the righteousness of the "battle" of Sand creek be discussed here. All this was gone over years ago and through many years, and left the disputants about where they were when they began.

Here in Denver Colonel Chivington and his men received a hearty and approving welcome upon their return. The general feeling was one of great relief, for an attack on the city by a large force of Indians, with all its attendant horrors had appeared inevitable. Therefore, Colonel Chivington and his men were hailed as heroes who had gone forth to meet and crush the advancing enemy, and save the city the peril of such an investment. The "battle" of Sand creek was at first regarded simply as an important conflict in which the cruel and merciless Indians had been overwhelmingly defeated by the superior skill and courage of the white men.

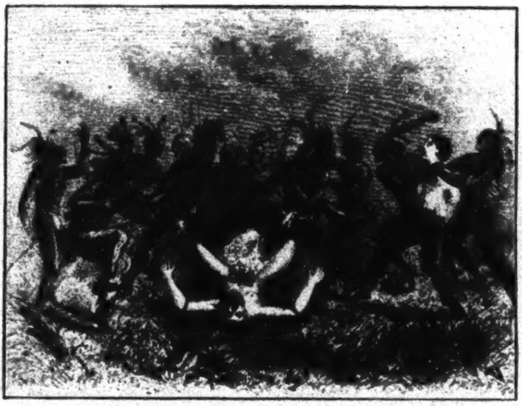
Later, after immediate danger to the city had become a thing of the past and was partly forgotten, and when the details of the affair were brought out by the investigations, and when the fierce blast of public indignation in the States swept across the plains to Denver, a change in public sentiment here set in, and it was not long until the community was divided into two angry factions—those who upheld and those who condemned Colonel Chivington. The feeling became personal and of intense bitterness; it affected business relations, and invaded the circles of social intercourse. Finally it became a political question, and as Chivington's upholders were of the faction favoring Colorado's immediate admission as a State, those opposed to State-hood made Sand creek an issue. The most intense political animosities were engendered, out of which grew much rancorous personal feeling.

The conditions and circumstances which led Colonel Chivington to strike the Sand creek blow were the accumulations of more than a year. He had been appointed commander of the Colorado Military District of General Curtis' Department two years previous. He was thoroughly familiar with the situation and forebodings in 1863, and had been ordered to prepare for the approaching emergency. He then had but a small force at his command, but through the winter of 1863-64 made preparations to use it for the protection of settlers against a large force of Indians which were wintering on the Smoky Hill Fork of the Republican river, and which might be expected to begin depredations as soon as spring opened.

View from Fourteenth and Arapahoe streets, looking toward site of present Equitable Building, in 1864. The old Catholic Cathedral appears on the right.

Early in April, 1864, Chivington was notified by General Curtis to look out for Cheyennes everywhere and to warn the troops on the Arkansas against them. Furthermore, Curtis instructed Chivington to disregard the lines of this military district if pursuit of hostile Indians was undertaken. In June occurred the slaughter of the Hungate family, and soon thereafter the frontier was ablaze. In September the resultless peace pow-wow with the Cheyenne and Arapahoe chiefs was held at Camp Weld, and on the day it was held General Curtis ordered that no peace be made with the Indians without his instructions for doing so, and stating that it would be better to whip them before giving them anything more than some tobacco to smoke when they afterward plead for peace. So, Colonel Chivington had concluded that at the first opportunity he would obey his direct and implied instructions by attacking the first band of hostile Indians that came within reach.

The execrations heaped upon Chivington were in the main inspired by his revolting order to his men that no prisoners should be taken, but that the firing was to continue as long as there was anything in the Indian village to kill. Then, the awful barbarities of butchering the helpless wounded including women and children, and scalping the dead, which followed the cessation of the more active work, could not be passed in silence. In several instances after the firing had ceased and the village was in Chivington's possession, unhurt squaws and children found concealed in the lodges, were killed in cold blood. Men who committed these horrible acts held themselves blameless because "Chivington ordered us to take no prisoners." It would seem that the men became utter savages under the influence of the hideous butchery in which they were participating.



Torturing Captives.

The fact that women were killed in the Sand creek "battle" was not in itself evidence of unmanly or dishonorable warfare. It is to be remembered that Indian squaws in battle would fight as bravely and as fiercely as the men, and that in an attack on a band of encamped Indians it was difficult, by reason of frequent similarity of dress, to tell a brave from a squaw. In many an encounter with the Indians of the plains white men found that they would pay the forfeit of their lives if they failed to defend themselves against squaws in consequence of deference to the latter's sex.

One of the stories widely circulated in the States, in connection with grossly exaggerated accounts of the Sand creek affair, was to the effect that upon the return of Chivington and his men to Denver the people of this city held a jubilee, one of the features of which was a "scalp-dance" around the exhibited scalps of Indians slain in that bloody tragedy. This alleged barbarism of the Denver people was as savagely denounced as the slaughter of the Indians was vehemently condemned. Some of the critics far removed from the appalling peril and consequences of contact with the western Indians when on the war-path, could not find in their vocabularies terms strong enough for fitting denunciation of this and everything else connected with the affair, as they understood the circumstances attending it. The truth concerning the exhibition of scalps in Denver and the conduct of the people here, was quite different from the reports current in the east. The Denver people did assemble and congratulate not only Chivington and his men upon the result of the encounter, as they understood its circumstances at the time, but each other, also, upon the lesson given the Indians that would in all probability prove so salutary that the city would escape attack and the massacre of its people. There was no "scalp-dance," nor any other kind of dancing, but there were scalps publicly exhibited. They were those of white men, women and children found among the Indians' effects at Sand creek and brought to Denver; the scalps of emigrants, of settlers, of wagon-train men, of little children, and of women who had suffered worse than a hundred deaths before their brief but fatal captivity ended. Of such were the scalps exhibited at Denver—some of which are still preserved in the city—upon Colonel Chivington's return.

The Indians of the plains were more fiendish in their cruelty than any others of their race, and horrors beyond the power of the mind to fully comprehend were the certain attendants of their modes of warfare. White men who understood their character while at war preferred to die fighting rather than to become prisoners to be tortured by frightful mutilations and then slowly burned to death. The experience of white women prisoners in their hands was too sickening to permit the circumstantial details to be recounted here. Sooner or later death came to their relief, and in not infrequent instances in the west during these years of Indian warfare, white women prisoners destroyed their lives rather than undergo the horrors of captivity with the savages. Young children were usually butchered where captured, as they were considered incumbrances. Sometimes, but not often, half-grown boys and girls were spared. In every instance the bodies of the dead were found in a frightfully mutilated condition, with evidence, especially in the case of women, that the horrible work had been done while the victims were still living. Scalping was the least repulsive of the Indian's practices in dealing with the persons of white people, on whom he made successful attacks in his warfare.

Whatever there was of direct official responsibility for the "battle" of Sand creek rested upon Colonel Chivington. Aside from his own ideas of dealing harshly in warfare, whether with white or red enemies, the logical meaning of his understanding of the purposes of his military superiors warranted him in taking quick and vigorous action. But the details of his brief campaign of Sand creek, which terminated his military career, were of his own planning, and he kept them to himself until he was ready to strike. One result of the Congressional investigation was that the government censured him, Governor Evans, and every one else assumed to have been nearly or remotely connected with the affair. Governor Evans was in no way responsible for it. He was in Washington when it occurred, and had not been informed by Colonel Chivington that such a movement with such bloody purposes in view, was contemplated. Even had the Governor known of it, he could not have officially interfered. Colonel Chivington was subject to the orders of the United States military authorities, and not to those of the Territorial Executive of Colorado.

Indians attacking a stage-coach.

For the attack and for the methods of it, Colonel Chivington never attempted to evade or lessen his responsibility. He believed that the Indians were confederated for a general uprising and that a devastating war was imminent. He also believed that the Indians, to be fought successfully had to be dealt with harshly, and that one crushing, merciless blow, sparing neither age, sex nor condition, would prove to be the more merciful method of warfare with them, after all. Furthermore, he also believed that such methods were the only ones the Indians could and would understand and heed, and that in the end his way of fighting them would save not only hundreds of white people, but would be less destructive of Indian life, if that were worth considering, than any other. In these views he was sustained by almost every frontiersman and by nearly every other white man familiar with Indian character.

Nevertheless, Colonel Chivington was regarded with extreme aversion by many of his fellow-citizens so long as he lived. He had many warm friends who upheld and defended him with all the zeal of the most devoted partisans; on the other hand, those who condemned him did so with an extreme bitterness that clouded the later years of his life, most gravely affected his personal fortunes, and heavily shadowed his pathway in whatever he undertook to do.

In August, 1864, Chivington had been nominated for Congress on the State ticket which, with the whole Statehood project, failed that year. In 1867, he left Denver and went to San Diego, California, where he lived in obscurity nearly six years. In 1873 he removed thence to Cincinnati and there married his second wife, and resided in that city until 1883, when he came back to Denver; continuing his residence here until his death. He entered local politics, became an Under Sheriff, and in 1891 was elected Coroner, the last position he filled.

Chivington died in Denver, of general debility, October 4, 1894, in his 74th year. A native of Warren county, Ohio, where he spent his boyhood, he became a Methodist minister and preached his first sermon in Quincy, Illinois. For twenty-five years he continued preaching in Illinois, Missouri and Nebraska, before coming to Colorado in 1860.

CHAPTER XLI.

CONTINUED INDIAN WARFARE—CITY THREATENED WITH FAMINE—MARTIAL LAW IN DENVER—DEPREDATIONS AND MASSACRES ALONG THE PLATTE—LONG AND BLOODY INDIAN WAR—FORSYTH'S HEROIC DEFENSE AT BEECHER ISLAND, ARAPAHOE COUNTY—INDIAN CRUELTIES—WESTERN VIEWS OF THE "INDIAN QUESTION"—EXPENSIVE WARFARE—INDIAN GRIEVANCES—LAST STAND OF THE ARAPAHOES AND CHEYENNES—INDIAN CHIEFTAINS—POWER OF INDIANS BROKEN.

Putting aside all questions of its justification or of its military necessity, all discussion of the right or wrong of meeting the red man with his own shocking savagery, the Sand creek affair was an impressive lesson to the Indians, and undoubtedly relieved Denver of the appalling danger which had immediately menaced it from every side. True, it infuriated them to the highest pitch and made them wild for revenge, but it caused them to fear and avoid attacking the community from which had gone forth the men who had visited upon them a retribution so awful. Never before in their experience had the white men made upon them such warfare as that.

Governor Evans had made several attempts to have a peace council with the Indians then roaming over eastern Colorado and western Kansas before the Sand creek affair, but to no effect. At one time he had gone out to the Republican river, and sent Elbridge Gerry to the camp of a large band then in that part of the country to persuade their chiefs to meet and talk with him. Some of the Indians had high regard for Gerry, but he could not influence them to have a peace-talk. One chief consented to go, but he changed his mind when his associates told him they would kill him if he tried it. So, the Governor came back to Denver much discouraged.

Through the winter of 1864-65 the Indian uprising grew to most formidable proportions, and all lines of communication between Denver and the east were interrupted so seriously, and so many of the freighters deterred from venturing out, or were captured if they did so, that the city was threatened with famine. All food and other supplies rose to almost fabulous prices. Governor Evans being absent in Washington, Secretary S. H. Elbert was acting Governor in the interim. The necessity for providing some protection for the lines of communication had become so imperative that Secretary Elbert, in December, called for six companies of independent volunteer cavalry to meet the emergency. But the harsh criticisms of the Sand creek tragedy had begun, with extreme bitterness in some instances, and they made men reluctant to respond to Elbert's call for a service likely to involve some additional work of the same character. Therefore, enlistments for the companies dragged so slowly that the needed relief seemed far away, and the people appeared bewildered by the circumstances of the situation.

On account of the Sand creek affair Colonel Chivington had been removed, and on January 4, 1865, Colonel Thomas Moonlight took command of the Colorado Military District and prepared for further vigorous action. The Territorial Legislature was in session, and Colonel Moonlight recommended that it amend the then existing militia law so that it would provide bounties and definite pay for volunteers, and compensation for their horses. A bill to that effect was introduced, but notwithstanding the simplicity and reasonableness of its provisions, and the great emergency of the situation, the two branches of the Legislature pulled and hauled and wrangled over it for two weeks without coming to an agreement. Impatient over such proceedings, and the necessity for action being imperative, Colonel Moonlight placed the city and district under martial law. Every kind of business except dealing in the diminishing stores of necessities, was suspended; the mines were closed and all industries stopped and were to remain idle until the troops called for were enlisted and organized.

There were reasons a-plenty for vigorous action. The stage route between Denver and Julesburg was in the hands of the Indians, and death and destruction marked its way. The glare of burning buildings was visible from the city at night, and the tales of refugees agitated the community by day. Every ranche but one between the two places was captured and burned during that month of January, and most of the stage stations had met a like fate. The men, women and children who had not sought and found safety by early flight, were horribly butchered. The station and warehouses at Julesburg were destroyed almost within sight of Fort Sedgwick where a considerable force of troops was stationed, but which, for some unaccountable reason, made no movement toward checking these Indian atrocities and depredations.

The one ranche between Denver and Julesburg that escaped destruction was the "Wisconsin," about one hundred miles due northeast of Denver, owned by Holon Godfrey and desperately and successfully defended by him and his associates. The place was attacked in daylight by one hundred and twenty-five Cheyennes, and defended by Godfrey and three other men—Blair, Daniels, and Perkins. Four women were there and also bravely aided in the defense. The Indians were held off all day, the women walking around inside the enclosure with hats on sticks to make the number of defenders appear larger. In the evening as soon as it grew dark Perkins succeeded in getting away unseen by the Indians and started on horseback to obtain help from some mounted soldiers encamped about seven miles west of the site of Fort Morgan. One of the women offered to go and Godfrey was inclined to have her do so, but Perkins objected to that, insisting that he should go. He rode like the wind and found the troops. The officer in command said he was under orders to be at Living Springs the next day, but that he would send four soldiers under command of a Corporal to the relief of the ranche. Upon nearing the ranche the soldiers hesitated about going farther because of the number of Indians. But one of them, named Ford, said he was "going, anyway," whereupon they all cautiously advanced and succeeded in getting inside at two o'clock in the morning. With this reinforcement Godfrey drove off the Cheyennes after ten of the Indians had been killed. From the desperate and deadly character of the resistance made, the Indians afterward called the "Wisconsin Ranche" "Fort Wicked," and its owner "Old Wicked."

Godfrey was a native of New York and a California miner in 1849-53, after which he returned east and settled in Wisconsin. He came to Colorado in 1860 and established the "Wisconsin Ranche" on the South Platte opposite and across the river from the site of the present village of Merino in the southwest corner of Logan county, and about one hundred miles due northeast from Denver. The ranche became a stage coach station, and when the Indians had become threatening, Godfrey fortified his place by constructing a thick sod wall about six feet high around the buildings. He lived on the "Wisconsin" until 1868, when he located on another, about three miles southwest of the town of Evans, where he continued to reside until his death which occurred on February 11, 1899.

Elbridge Gerry had a ranche in the valley of the South Platte, sixty-seven miles northeast from Denver, which the Indians had planned to capture after they had disposed of Godfrey's. Some accounts say that Gerry was notified of the impending raid by two Cheyenne Indians, while others have it that his Indian wife discovered the plot and told him of it. At all events he succeeded in saving his life and movable property. Gerry, as the reader knows, was a pioneer in the Denver region before the city was founded, but was too late to rank with such frontiersmen as Kit Carson and Jim Baker. He was a native of Oswego county, New York, and claimed to be a near descendant of Elbridge Gerry, one of the signers of the Declaration of Independence. He was a trader among the Indians, and became a citizen of Denver in the early times. He has been dead many years.

A short time before the attack on the "Wisconsin" ranche, Godfrey was riding behind a coach bound for Denver with a few passengers. The coach was attacked by a band of Indians who cut in between it and him. He started at full speed for his ranche to get assistance for the relief of the imperilled coach, with a party of savages hot in pursuit of him. As he was able to load and fire while his horse went at a gallop, he tumbled two or three of his pursuers off their ponies and reached his home unhurt. He immediately set out with several ranchmen to rescue the coach people, but was too late. All had been massacred and mutilated, the coach rifled and overturned, and the horses were gone with the Indians, who left proof behind them that those shot by Godfrey had not been the only ones who suffered, for the occupants of the coach had fought to the death. It was believed that Godfrey's connection with this tragedy was the immediate cause of the subsequent attack upon his ranche.

Indian Raid on a Stage Station.

Simultaneous with the attack on the "Wisconsin," the "American Ranche," two miles to the east of Godfrey's, was invested by a band of Cheyennes and Arapahoes. Its inmates consisted of five men, one woman and a child. Eleven Indians were killed in the heroic defense before the place was taken. Then the men and child were butchered, scalped and otherwise mutilated, the buildings burned, and the woman carried off to a fate from Indian violence and torture worse than many deaths.

These two ranches became famed as the only places along the South Platte in Colorado where Indian assaults were made a disastrous defeat or a bloody victory during that winter. From the "Wisconsin Ranche," clear down below Fort Kearney, not a living man, woman or child of those connected with the stage stations or ranches was left, excepting the few who made miraculous escapes by flight. For a period of about six weeks the stages did not attempt to run through. So, it was time for quick action.

Colonel Moonlight's drastic methods had quickly brought about the desired result. Secretary Elbert had amended his call by making it for seven mounted companies, of which Arapahoe county was to furnish two, Clear Creek one, Gilpin two, Jefferson one, and one from the three counties of Boulder, Larimer and Weld. With the knowledge that a lack of volunteers would have to be made up in some other way, the little army was speedily and voluntarily enlisted for three months' service on the plains of Colorado, and the city and district relieved of martial law. Samuel E. Browne, then Attorney General of Colorado, was placed in command of this force with the rank of Colonel; and David H. Moffat was appointed Adjutant-General, to the duties of which position were added those of Quartermaster.

In the meantime General Grenville M. Dodge had been appointed to the command of the Kansas military department, of which Colorado Territory was a part, and assumed charge on February 11th. He had promptly ordered Colonel Moonlight to use all available troops here for protecting the line of communications eastward from Denver. With great energy Moffat had collected provisions and supplies, and arranged for their transportation as would be required by the movements of the new organization. By the latter part of February the several companies had been completed, organized and equipped, and on the 20th of that month marched away from Denver for their posts of duty. They were distributed along the stage route between Denver and Julesburg, which was the only route to the eastward which the conditions warranted an effort to keep open.

The companies remained on this duty during the period of their enlistment, effectively protecting that part of the line, and without having a single encounter with the Indians. Whether it was fear of Colorado men in consequence of the Sand creek affair that kept the savages away from the Denver-Julesburg route during that time, or because they were all engaged elsewhere, was not certainly known; but not a single Indian presented himself within view or gun-shot of acting Governor Elbert's militia during that campaign.
